The Immigration Act, 1924.—This Act came into force on July 1, 1924, and assigns a temporary maximum limit of about 160,000 to the number of immigrants from Europe to be admitted in any one year, that number to be ultimately reduced to 150,000 per annum. (This total is exclusive of immigrants from countries outside the operation of the law and of non-quota immigrants.) The main provisions of the Act are:—

(i.) In any year there shall be admitted to the United States not more than 2 per centum of the number of foreign-born individuals of any nationality resident in Continental United States as determined by the United States census of 1890. This constitutes each country's quota. The minimum quota of any nationality is 100. The census of 1890 was chosen because it was considered that the census record of that year showed that the number of foreign-born persons then corresponded better than later censuses to the racial composition of the United States population in 1924. On this basis the annual quotas allotted to the principal countries of emigration are as under. For comparison the quotas allotted under the 1921 Act are also shown, and the average immigration from the countries mentioned during the decade 1901–10:—

	Quota 1921–2	Quota 1924–5	Average Immigration 1901–10
Northern and Western Europe			
Belgium	1,563	512	4,163
Denmark	5,619	2,789	6,528
France	5,729	3,954	7,337
Germany	67,607	51,227	34,150
Great Britain and Northern Ireland	77,342	34,007	52,595
Irish Free State	..	28,567	33,906
Netherlands	3,607	1,648	4,826
Norway	12,202	6,453	44,003
Sweden	20,042	9,561	
Switzerland	3,752	2,081	3,499
	197,463	140,799	191,007
Southern and Eastern Europe			
Austria Hungary	13,089	1,258	214,526
Czechoslovakia	14,357	3,073	..
Italy	42,128	3,845	204,587
Poland	30,977	5,982	..
Rumania	7,419	603	5,300
Russia	24,405	2,248	159,370
Yugoslavia	6,426	671	..
	138,801	17,680	583,783

The total immigration from south and eastern Europe was reduced to less than one-fifth of that from northern and western Europe, the proportion being 15% and 84% respectively. The effect is still more noticeable if the emigration to the United States from the most important European countries of emigration in 1914 is compared with that during the years 1921–7:—

desirable types. Immigrants from other countries on the American continent do not come under the law at all if born in one of those countries, but if born elsewhere they can only be admitted as part of the quota of their country of birth, *i.e.*, a person born in Great Britain can only be admitted from Canada if he can be included in the British quota.

(iii.) Aliens ineligible to become naturalized citizens under the United States naturalization laws are not admitted excepting under existing Treaty stipulations. This provision excludes the Japanese. Japanese immigration had previously been governed not by a formal treaty, but by a "Gentleman's Agreement" under which the Japanese Government agreed to limit the entry of its subjects into the United States.

(iv.) The Act also provided that after July 1, 1927, the total number of immigrants in any one year was to be reduced to a total of 150,000, the quota of each nationality being the proportion of 150,000 determined by the ratio between the number of inhabitants having that national origin to the total population of the United States in 1920. This is known as the "national origin" plan. It did not take effect on July 1, 1927 Congress postponing its operation for a year. On this basis, according to proposals laid before Congress in March 1928, the principal alterations would be the increase of the quota of Great Britain from 34,007 to 66,000, and the reduction of the quota of Germany from 51,227 to 25,000, of the Irish Free State from 28,567 to 17,500 and of Norway, Sweden and Denmark from 18,803 to 11,000.

The national origin plan was intended to give immigrants from the various countries representation approximately proportional to the number of people of their own nationality domiciled in the United States. In principle it seemed fairly easy to work out such representation; in practice it has proved difficult and the provisional quotas to be allotted have been changed several times.

The restrictive legislation was two-fold in its intention: (i.) to reduce the number of immigrants so as to afford an opportunity for assimilation; (ii.) to allow future immigration on a scale designed to preserve a reasonable degree of homogeneity in the population of the United States. "The myth of the melting pot has been discredited. . . . The day of unalloyed welcome to all peoples, the day of indiscriminate acceptance of all races has definitely ended" (Johnson).

The effect on the proportion of the English-speaking races (English, Irish, Scotch and Welsh) entering the United States is shown in the following table:—

Immigration Into the United States of English and Non-English Speaking Races

Year	Total immigration	English-speaking	Non-English speaking	Percent of total English	Percent of total Non-English
1914	1,218,480	107,199	1,111,281	8·8	91·2
1921	805,228	120,080	685,148	14·9	85·1
1922	309,556	64,172	245,384	20·7	79·3

*Note: Figures for the years 1913 and 1920–2 include the whole of Ireland: for the years 1923–7 the detailed figures in the table are exclusive of the Irish Free State.

The totals in the last column include for the years 1923–7 the figures for the Irish Free State, for purposes of comparison.

of the main source of the unskilled labour supply of the United States. Unskilled labour in the past has been drawn mainly from the new immigrants and the supply of skilled labour largely from their children, since the tendency is for the more laborious and less remunerative tasks to be left to immigrants. The immigrants under the quota law are not likely to be of the type which will fill the places in the industrial system left vacant by the old type of immigrant. One effect of the restriction on overseas immigration is already apparent; it has encouraged the movement of negroes from the agricultural southern States to the industrial North and it is drawing from across the Mexican border immigrants who are presumably no more desirable from a biological point of view than those European races excluded by the quota law. It has also led to increased immigration from Canada, from which country and from Mexico there is in addition a considerable amount of illegal immigration. The extension of the quota arrangement to countries on the American continent and an aliens registration law have been advocated. For the National Origins Act of 1929, *see* UNITED STATES, *Population and Social Conditions.*

MOVEMENT OF POPULATION WITHIN THE BRITISH EMPIRE

For nearly two centuries emigration has been a habit with the British people. Beginning in the 16th century there has been a continuous flow of population from the British Isles to all parts of the world. The stream has fluctuated with changing conditions in Great Britain and in the countries overseas, but since it began, although it has sometimes slackened, it has never ceased.

The first British settlements overseas date from the 17th century, when colonies were established in Virginia, Massachusetts, Bermuda and Barbados. Emigration did not attain large proportions in the 18th century, but between 1820 and 1914 over 16,000,000 people left the United Kingdom to settle overseas. From this total must be deducted the number of foreigners who emigrated by way of Great Britain, of whom no separate record was kept before 1852, and also the number of emigrants who returned. On a rough estimate, however, it is probable that the net emigration from Great Britain amounted to 10,000,000 during the hundred years from 1820. The figures reflect the influence upon emigration of conditions in Great Britain and overseas; for instance, the Irish potato famine of 1846 and gold discoveries in California and Australia resulted in an average outflow of 286,000 a year in the nine years 1846–54. Later, the agricultural crisis of 1880–90 was responsible for a large increase in emigration.

Statistics.—The above table shows the British migration movement to and from countries outside Europe for the years 1913 and 1920–27.

The United States was for a long time the chief destination of British emigrants. Between 1815 and 1906 out of every 100 British emigrants 65 went to the United States, 15 to Canada, 11 to Australia and 7 to other parts of the empire. But these proportions changed in later years. The United States still headed the list up to 1904, but after that the dominions absorbed the larger portion, viz., 62% in 1910, 70% in 1912, 75% in 1919, 71% in 1920 and 79% in the years 1920–7.

In 1914 and previous years the flow of population from Great Britain averaged 350,000 per annum, of which 200,000 went to the dominions. During the years 1920–27 the total migration averaged 206,000 per annum, of which 163,000 went to the dominions.

Assisted British Migration.—At the close of the Napoleonic Wars the rapid growth of population and the prevalence of distress led to the adoption of a measure of State-aided migration and to the formation of colonization societies. The first settlements in the Cape of Good Hope and New Zealand were the outcome of this movement. Changes in conditions in Great Britain and the acquisition of responsible Government by the 'colonies,' who took over their own Crown Lands (by the sale of which assisted emigration had been financed), resulted in the gradual abandonment

of the policy and the grant of State-aid ceased in 1878. Numerically it had little effect on British emigration during the 19th century, for of the 8½ million emigrants during the period 1815–75 only 350,000 were assisted. It had a very considerable effect, however, in stimulating settlement in the dominions. Between 1878 and 1919 no encouragement was afforded by the British Government towards emigration although the question of State-aid was again raised during the period of distress in 1884–5. Nor was anything done (apart from the establishment in 1886 of an office—the Emigrants' Information Office—to collect and publish accurate information with regard to the British colonies) to direct migration to the British dominions rather than to foreign countries.

Since 1919, however, the British Government has again been endeavouring to encourage and direct migration from Great Britain. The importance of oversea settlement (as the movement of population within the empire is officially designated to distinguish it from emigration to foreign countries) was strongly emphasized by the Dominions Royal Commission (1917), which urged the need for a more effective supervision and direction of migration by co-operation between the Home Government and the Governments of the dominions.

At the close of the World War it was felt that the prospect of settlement overseas would appeal strongly to ex-soldiers and the British Government granted free passages to ex-service men and their dependents who desired to settle overseas within the empire. Under this scheme 82,000 souls were assisted to settle in the dominions.

The conference of prime ministers of the empire held in 1921 recommended co-operation between the home and dominion governments in a comprehensive policy of empire land settlement and empire directed migration. In accordance with this recommendation the Empire Settlement Act was passed in 1922. This Act, which forms the basis of the British Government's policy of State-aided overseas settlement, remains in force until 1937 and empowers the British Government to spend up to £3,000,000 per annum in co-operation with the government of an oversea dominion or with public or private organizations in Great Britain or overseas in schemes for assisting settlement in the dominions. The contribution of His Majesty's Government must not exceed one-half of the cost of any scheme.

The assistance granted towards oversea settlement under the Empire Settlement Act takes various forms. Assisted passage schemes have been arranged which considerably reduce the cost of travel to the settler, free passages are granted to young persons, and to single women in many cases. Assistance is given to enable suitable persons to settle on farms of their own in the dominions, and courses of training and testing in the United Kingdom have been arranged to prepare men and boys for farm work overseas, and women for household work. Under an arrangement between the Home Government and the Government of the Commonwealth of Australia the latter has agreed to raise loans for the purpose of making advances up to £34,000,000 at a low rate of interest to the State Governments in Australia for expenditure on approved schemes of settlement and development. The British Government contributes as a free grant towards interest on the loans one-fifth of the total amount raised, and Australia undertakes to absorb a total of 450,000 settlers from the United Kingdom within a period of ten years.

The work of voluntary organizations both in the United Kingdom and overseas is subsidized by the Governments on both sides. (*See* also OVERSEAS SETTLEMENT COMMITTEE.)

The table in next column shows the total migration from Great Britain and Northern Ireland, the total to places within the empire, and the total number of persons assisted under the Empire Settlement Act during the years 1923–27.

Year	Total migration overseas	Total migration within Empire	Total assisted migration
1923 . . .	256,284	157,062	36,185
1924 . . .	155,374	132,217	41,044
1925 . . .	140,594	105,265	39,529
1926 . . .	166,601	132,306	65,530
1927 . . .	153,505	122,733	63,027
Total . .	872,358	649,583	245,315

In each of the years 1926 and 1927 of those who went to places within the empire 50% were assisted. The proportion of assisted migrants to Australia was 73% and 71%, to Canada 42% and 55%, and to New Zealand 71% and 56%, in 1926 and 1927 respectively.

It is generally admitted that the results which have attended the working of the Empire Settlement Act have not been entirely satisfactory. In spite of an immediate surplus of population in Great Britain and of the grant of State-assistance on a liberal scale both the total migration from Great Britain and that to the dominions are less than in the period before 1914. The effect of the grant of State-aid has to a large extent been offset by the severe restrictions which the dominions have found it necessary to impose on the classes of persons to whom assistance can be granted.

Whilst it is impossible to say what would have been the rate of migration since 1919 in the absence of State assistance it is certain that the grant of State-aid has not resulted in any increase in the numbers of persons proceeding overseas, and it is very probable that had it not been for the United States quota restrictions the outflow to the dominions might have been smaller than it actually has been. In this sense the quota law has furthered Great Britain's policy of diverting people to the dominions. But whilst the United States absorbed large numbers of industrial workers, in the dominions the main openings for British settlers are on the land. For this reason the dominions do not offer to a mainly industrial people (safeguarded by extensive systems of social insurance) the same attractions as the United States. Great Britain has large numbers of skilled industrialists surplus to her immediate requirements who could with advantage to Great Britain be settled overseas. The dominions are, however, unable to encourage the immigration of industrialists as such, partly on account of the undeveloped state of their secondary industries, and partly on account of the attitude towards any form of immigration except that for agricultural work of the urban populations in the dominions, who naturally desire to safeguard their own position and to protect their standards of living. The door is open into the dominions, of course, for all classes of workers from Great Britain who can pay their own passages, but the high cost of ocean passages, particularly in the case of Australia, acts as an effective bar to any large stream of unassisted migration.

British Migration Policy.—The object of Great Britain's policy of oversea settlement is the distribution of the white population of the empire in the most efficient manner both from the point of view of the economic development of the empire and of its security. The policy is essentially one of close co-operation between the Home Government and the Governments of the dominions. In Great Britain the population is congested, in the oversea dominions there is ample room for additional population, and unless the dominions are peopled with British stock they will be filled with alien people from other parts of the world. A redistribution of population is recognized as necessary both in the interests of the empire itself and also for the reason that the reservation of vast areas for settlement by the British race cannot be justified if advantage is not taken of them. Whilst the policy is not a temporary one for dealing with depressed economic conditions in Great Britain it is claimed that its fulfilment should do much to stabilize industrial conditions both in the mother-country and in the oversea dominions.

The British empire includes both countries of emigration and countries of immigration and has its own problems to solve arising from this fact. The position created by the restrictions imposed by the dominions on Asiatic immigration has in the past presented delicate problems. By the end of the 19th century the question of Asiatic immigration had become acute in the dominions and restrictive legislation began to appear. After much discussion the principle appears to have been accepted by all the Governments concerned that the policy of building up new nations within the

empire is incompatible with the idea that any British subject, whatever his race, shall have full right of ingress to any part of the empire. At the Imperial War Conference of 1918 it was laid down that 'it is an inherent function of the Governments of the several communities of the British Commonwealth, including India, that each should enjoy complete control of the composition of its own population by means of restriction on immigration from any of the other communities.'

In Canada, foreign immigration is also causing some concern. During the ten years prior to 1914 British immigrants constituted the larger proportion of Canadian immigration, but the proportion of foreign immigrants from Europe has been steadily increasing until it exceeds that of British stock. In 1927 there were 52,940 immigrants of British extraction as against 82,136 from other European countries. This predominance is further accentuated by the considerable emigration from Canada to the United States, of which only one-sixth, according to the United States statistics, is foreign. If immigration to Canada continues to maintain these proportions it is only a matter of years before the predominant race in the Dominion ceases to be of British origin.

MIGRATION OVER LAND FRONTIERS

The migration which has been noted over land frontiers (Continental migration) has long been a feature of the movement of population in all parts of the world. In Europe it is mainly of a seasonal and temporary character as opposed to overseas migration, which is primarily a movement for permanent settlement.

France for many years has been dependent on foreign labour. In 1911 there were 1,159,835 foreigners in France, mostly Italians, and agricultural labour was regularly recruited abroad by official organizations. Germany also depended, after its industrial expansion began, on the seasonal migration of labourers from Poland, to the number of 250,000 a year for the harvest season alone.

Since 1918 Continental migration has increased in importance, not only on account of the larger numbers involved but on account of the political difficulties to which the movement has given rise. The work of reconstruction in France and Belgium and the restoration of the industries of those countries after the World War could only be effected by the aid of large numbers of labourers from other European countries. Continental migration in Europe has been further stimulated by restrictions on overseas emigration, for the demand for labour in France, Belgium and Luxemburg, supplied an outlet for the surplus population of Europe denied admission to the United States.

Before 1914 Germany was the principal employer of foreign labour (almost entirely agricultural) but since 1918 Germany has required only a fraction of its pre-war supply, has restricted the entry of foreign workers, and is seeking outlets for her own people. France, on the other hand, has been absorbing a largely increased, although fluctuating, volume of foreign labour. In 1923 and 1924 the number rose to over 250,000 a year, but has since declined considerably. The great majority of the immigrants into France were Italians.

The influx of foreign workers into the various countries of Europe has raised very difficult economic and social problems—questions of hygiene, national security, the legal and social position of the migrants, their status under the social insurance systems of the country of immigration. With a view to smoothing over these difficulties a large number of international arrangements have been concluded. Treaties or agreements have been entered into by France with Poland, Italy, Czecho-Slovakia, Belgium and Austria; by Italy with France, Luxemburg, the Serb-Croat-Slovene Kingdom and Albania; and by the Argentine Republic with Austria, Belgium, Denmark, Italy, Spain, etc.

Continental Migration—America.—The two main features of continental migration in America are (*i.*) the movement northward of the negro population of the United States; and (*ii.*) migration across the Canadian and Mexican borders.

(*i.*) The practical cessation of immigration from Europe during the World War and the increasing demand for labour led to a remarkable development in the negro problem in the United States. Large numbers of negroes from the southern States migrated to the industrial centres of the North attracted by the high wages and the conditions of town life. The restrictions placed upon immigration from Europe after the war further encouraged this movement, for the supply of unskilled labour in the United States has been drawn in the past largely from new immigrants.

(*ii.*) The reduction of oversea immigration has also been accompanied by increased immigration from Canada, which from the point of view of both countries is open to objection. To Canada it means that its immigration from Europe is being largely off-set by the movement across the border. During the three years 1925–7 the total immigration into Canada from overseas amounted to 340,000. During the same period it is estimated that 282,000 Canadians crossed into the United States. This emigration was only partially counter-balanced by the return of 144,000 Canadians temporarily resident in the United States.

On the other hand, from the point of view of the United States, it means that the restrictions placed upon immigration from Europe are being to a large extent rendered ineffective, for although persons born in Europe can only enter Canada on the quota of their respective countries of birth, the difficulty of controlling the movement across the border is so great that illegal immigration ("the bootlegging of aliens") is conducted on a considerable scale. More effective control appears to be essential if the United States immigration policy is to be maintained.

The shortage of labour in the southern States caused by the movement of negroes to the North and by the restrictions on immigration from Europe was met by a considerable immigration of Mexicans across the border.

The net addition made to the Mexican population of the United States in 1927 was 69,685, which was 15,237 more than in 1926, and 24,667 more than in 1925. It is probable that the quota law will have to be extended to Mexico and other countries on the American continent and further steps taken to check illegal immigration.

MIGRATION LEGISLATION AND INTERNATIONAL REGULATIONS

Restrictions and Control of Emigration and Immigration.—It has already been made apparent that the feature of the migration movement of the 19th and early 20th centuries was its comparative freedom from restrictions. So far as the white races were concerned, countries of immigration only interfered to the extent necessary to protect themselves from the incursion of persons regarded as undesirable, whether for medical or moral reasons, or of those likely to become a burden on the community. Since the World War, however, restrictions have been imposed upon the movement of population by countries of immigration which go beyond considerations of this nature, and, in addition, countries of emigration have imposed restrictions for national or political reasons. Migration has become subject to strict Government control, political intervention and methodical planning.

In the first place, countries of immigration have become much more strict in regard to civil and medical tests; immigrants are subjected to a process of selection and only admitted with severe restrictions in regard to numbers; occupational tests are enforced in many cases, and racial discrimination is applied even against the countries of Europe. Reference has already been made to the United States policy. South American and other countries have adopted somewhat similar restrictions. Brazil, Uruguay and Argentine, which before 1914 encouraged white immigration, have restricted it to certain classes, and even at times suspended immigration entirely. Canada restricts immigration from certain countries on the continent of Europe to *bona-fide* agriculturalists, prohibits assisted migration (except from Great Britain), and practically excludes certain European races entirely. Australia and New Zealand discourage, and have taken power to exclude, the immigration of any but British stock. France, which, since 1918, has been, in point of numbers, the second most important country of immigration, has also found it necessary to place limitations on the numbers of foreign immigrants.

The considerations which the countries of immigration have in view are sometimes economic, sometimes the safe-guarding of

standards of living; with others the motive is racial, either to limit the numbers of certain stocks or to preserve a territory as an area for the settlement of a particular race.

Countries of emigration are also adopting policies of restriction, or at any rate of control. Some of the new nations in Europe, *e.g.*, Czechoslovakia, Lithuania, from which there was formerly a considerable outflow of population, regard emigration as a danger to their national strength and for this reason have adopted a restrictive policy. Other countries, in order to protect their nationals prohibit or discourage emigration to territories where conditions are regarded as unsuitable. Some countries, *e.g.*, Italy, compelled, owing to the lack of suitable colonies of their own, to enrich foreign economic systems with the labour of their nationals, endeavour to turn the emigration of their people to national advantage and to secure concrete economic and political benefits for the nation as a whole, the increase of national influence abroad and the creation of fresh markets for national products. Emigrants are encouraged to preserve their original nationality and to return with their savings to the mother-country.

No country since the World War has devoted more consideration to the question of migration than has Italy. The annual increase of population in Italy amounts to 500,000 per annum. Some 200,000 Italians were formerly absorbed annually in the United States, but by the quota law this outlet has been practically closed. France for a time took the place of the United States as a field for Italian emigration, but the restrictions which France later imposed upon foreign immigrants made it necessary for Italy to seek outlets for her population in other countries, where for various reasons Italians were not always welcomed. One of the aims of Italy's policy has, therefore, been that of overcoming the objections to her emigrants by raising their standard and improving their equipment. Italy herself controls and apportions her emigration and restricts it to persons most likely to prove acceptable overseas, and for whom there is a reasonable prospect of employment. The difficulty which Italy has experienced in finding suitable outlets for her population overseas may be the cause of the change of attitude on the part of the Italian Government towards the population question. According to this, the Italian Government would appear to regard the growth of the Italian population with less apprehension than formerly and has adopted the view that Italy must conserve her man-power. With this object, it has been announced (1927) that emigration, which impoverished the nation, both from the point of view of quantity and quality, must be restricted, and reserves of population allowed to go abroad only when it is desirable to encourage an organic colonization movement.

Conflicting national policies necessarily arise from the divergence of interests between countries of emigration and countries of immigration. The tendency of the former is to encourage emigrants to retain their former nationality in their new homes, whilst countries of immigration naturally desire the rapid assimilation of the immigrants. The application of the United States quota law gave rise to protest in a number of countries and the policy of exclusion in regard to Asiatics pursued in the United States and in the British dominions has been unwelcome, especially to Japan. The new French Law on nationality has been regarded by Italy as a menace to emigration from that country, whilst the emigration policy of the Italian Government itself has sometimes been regarded as incompatible with the national sovereignty of other countries.

This evolution from practically complete liberty of movement to increasingly strict regulation has had considerable effect on migration both in regard to extent and character. The total number of emigrants is falling in comparison with the period prior to 1914. On the other hand there is probably very much less wastage of human material under the modern system.

The increase in the cost of transport has a further restrictive effect on the movement of population, and has led to many Governments affording financial help to suitable emigrants, *e.g.*, the policy of State-aided migration within the British empire, and the assistance afforded to emigrants by the Italian Government through the Institution for Colonization and Work Abroad (the I.C.L.E.) which was formed in 1921 with a large capital subscribed by Italians at home and abroad to finance Italian settlement in foreign countries. The Japanese Government subsidizes emigration societies and assistance towards migration is also afforded or is in contemplation by the Governments of some of the countries of northern Europe. The grant of assistance, is, however, as a rule so circumscribed by conditions imposed by the countries of immigration that its stimulating effect on migration is insufficient to counteract the restrictions in other directions.

Asiatic Immigration.—All the Anglo-Saxon communities overseas have placed restrictions which practically amount to exclusion upon the immigration of Asiatics. The immigration of Chinese into Australia was restricted by legislation as early as 1855. In the United States Chinese are excluded under the Chinese Exclusion Act of 1882. Restrictions on Japanese immigration are later in date, and in spite of long agitation by California (the State most affected) no special restrictions were placed on Japanese immigration into the United States until the so-called "Gentleman's Agreement" of 1907 which was an understanding between the Governments of the United States and Japan by which the latter voluntarily undertook to adopt and enforce administrative methods designed to check immigration into the United States. Under the Immigration Act, 1924, Japanese are excluded by the provision under which aliens ineligible to become American citizens are not admitted except under existing Treaty stipulations. It was the refusal of the United States Government to regard the "Gentleman's Agreement" as in the nature of a formal treaty which gave rise to such resentment in Japan.

South Africa, Australia and New Zealand have by various methods provided for the exclusion of Japanese subjects. Canada failed to take similar action but later sought to remedy the omission by a Gentleman's Agreement limiting yearly admissions to 400. This Agreement has not worked satisfactorily.

The Japanese, in consequence of these restrictions, have turned their attention to the South American countries, but their success has for various reasons been slight. It was officially announced in 1926 by the Japanese Government that Japan would no longer endeavour to send her emigrants to countries which did not wish to receive them. (*See* CHINESE IMMIGRATION.)

International Regulation.—The practically unrestricted liberty which characterized the movement of population prior to 1914 made arrangements between nations relating to migration unnecessary, except in the case of Asiatic immigration into certain countries. The problems and difficulties which have arisen since the World War in regard to the movement and distribution of population have transformed migration into an international question. New situations have been created by the artificial restrictions which obstruct the movement of population and migration itself has changed in direction and character. Social legislation has everywhere increased and the welfare of its emigrants is a matter of concern to every nation. The increase in Continental migration and the desire of each country to protect the interests of its emigrants, and sometimes to derive political and economical advantage from their movement, has given rise to questions regarding the transport, and the social and legal status of migrants, which could only be adjusted by diplomatic arrangements between the countries concerned. Such arrangements arise from a certain coincidence of interests between nations. Countries with a deficient labour supply and those with available labour are equally concerned in organizing the movement of population so as to eliminate possible causes of friction. The co-ordination of these arrangements is obviously desirable. This function was allotted to the International Labour Office which was established by the Peace Treaty, 1920, and one of whose duties is that of securing equality of economic treatment in any country for all workers legally resident therein.

A recommendation in favour of reciprocity of treatment as between national and foreign workers was passed by the first International Labour Conference at Washington in 1919. This conference appointed an International Emigration Commission which met in 1921 and considered such questions as the co-ordination of national legislation on the subject of migration, equality

of treatment of foreign workers, the elimination of agents interested in promoting emigration, and the creation of national systems of labour exchanges and information offices. At subsequent sessions of the International Labour Conference recommendations have been passed and draft conventions adopted dealing, among other things, with the communication to the International Labour Office of statistical and other information regarding migration; the equality of treatment of foreign workers as regards workmen's compensation; the protection of emigrant girls and young women, and the simplification of the inspection of emigrants, on board ship. A standing International Commission assists the International Labour Office in the work of endeavouring to give effect to the recommendations of the Conference.

In 1924, at the invitation of the Italian Government, an International Emigration Conference was held at Rome at which about sixty countries were represented. This conference to a large extent duplicated the work of the International Labour Conferences but it had the advantage of including the United States, which is not a member of the International Labour Office. The Rome conference dealt mainly with the technical and legal problems, similar to those discussed at the various International Labour Conferences, and was not of a diplomatic character. One of the most important resolutions was that dealing with the "Charter of Emigrants," which was an attempt to embody in a declaration the general principles which should govern legislation and international agreements for the regulation of migration and the treatment of emigrants. Some of the recommendations (and particularly the Charter) were not acceptable to certain countries as they were regarded as embodying principles such as the encouragement of migrants to cling to their former nationality or to involve too great a measure of State control. The Charter covered political and judicial questions which were regarded as outside the scope of a technical conference and others were considered to fall more properly within the scope of the international organizations set up under the Peace Treaties.

The matters dealt with at the Rome conference were further discussed at a second International Emigration Conference which was held in Cuba in 1928.

All measures of the nature referred to have as their object the protection and welfare of the emigrant and whilst they involve the strict control of migration they do not raise difficult political questions. There is a further international aspect of migration, however, which raises problems of a different character. The restrictions placed upon immigration by oversea countries have increased the difficulty of the population problem in Europe. The Rome conference revealed how closely the regulation of migration touches the sovereignty of the different States, and the difficulties in the way of international uniformity on even technical questions. It is clear that the divergence of view between countries of immigration, and countries of emigration on matters of policy will be much more acute. On the one hand is the desire of a country to determine the composition of its own population by admitting only such persons and races and in such numbers as it considers it can assimilate; on the other, the need for outlets for surplus population. The claim that any country with a sparse population must be ready to admit the overflow from a densely populated country has to be reconciled with the right of every country to protect its standards of life against incursions from outside and to safeguard itself from racial admixture.

MIGRATION OF ANIMALS. While it is among birds (*see* Birds, Migration of) that migration is seen in its most typical form, it also occurs in many other animals, and it is to these that this article refers. But there has been an unfortunate tendency to apply the term in a loose way to many movements of animals very different from the migrations of birds. Migration in the strict sense, defined in reference to its most typical expression in birds, is a racial custom, enregistered in the animal's constitution, and takes the form of a periodic or seasonal mass-movement between a breeding place and some other environment in which breeding does not occur. Migration therefore implies that the animals concerned have two haunts in which they regularly live at different seasons of the year or at different phases of their life. It is illustrated among seals, turtles, toads, by such fishes as salmon, and by such crustaceans as land-crabs. It is a pity that a convenient term should be blurred by an application to phenomena which it does not fit. The following should be excluded from the rubric of migration. (*a*) Roaming movements in search of food, whether at short intervals or at different seasons, are not migratory. The march of the Scandinavian lemmings, when they have exhausted the vegetation of a district, is not a migration, nor is the devastating swarming of locusts. (*b*) Mass-movements, of fishes for instance, that are not related to reproduction, but are instigated by marked changes in the physical conditions or in the dependent distribution of the food should not be mixed up with migrations. (*c*) The movements of larval animals from their birthplace to another more suitable environment, as when the larvae of shore animals become pelagic and return to littoral waters at metamorphosis. It would be just as unprofitable to apply the term migration to the movement of may-fly nymphs out of the water, or the movement of liver-fluke cercariae out of their water-snail host. The word has been similarly misapplied to the striking march of processionary caterpillars from the pine-trees along the ground until they find suitable soft soil into which to burrow for pupation. (*d*) The various forms of extension of geographical range, which may be very impressive as in the incursions or "invasions" of sand-grouse into Britain, or may be, as is more frequent, very gradual and hardly perceptible from generation to generation. The passive diffusion of gossamer spiders by the wind, or of marine animals by oceanic currents, is certainly not migration. Yet the term is persistently applied to the often striking mass-movements of butterflies and some other insects, which are usually, if not invariably, dispersal-movements.

Distinctive Features.—The distinctive features of true migration are: (*a*) It is a racial custom, with a hereditary basis, but activated by particular stimuli, internal and external. (*b*) It is of regular recurrence, seasonal or periodic, or occurring when the animal reaches a particular age or state. (*c*) It is a geographical or topographical change from one haunt to another, one being the breeding-place. In typical cases there is a return journey, as in migrant birds. In some cases, such as the common eel, the adults die after spawning, and the return journey is thus confined to the young.

The scope of migration has been admirably summarized by A. L. Thomson (*Problems of Bird Migration*, 1926). "To deserve the description 'migratory,' in its strict sense, movements need not necessarily have a very great geographical amplitude, but at the least they must involve a definite change of locality. They must be purposive in that the change of scene is associated with some definite advantage which serves as its raison d'être, and there must be return movements to the original area. They must be periodic in that they correspond to some recurrent change either in the environmental conditions themselves or in the animal's reaction thereto. True migrations are changes of habitat, periodically recurring and alternating in direction, which tend to secure optimum

conditions at all times."

Mammals.—Perhaps the best instances of true migration in mammals are to be found among seals. The Alaska fur seal (*Callorhinus alascanus*) winters as far south as California, and returns in spring across the north Pacific for 2,000 miles to its breeding place on the Pribilof islands. Cetaceans, being more thoroughly adapted to marine life than the pinniped carnivores, do not need to come to the shore to breed, yet there is evidence of migratory movements. The same may be said in regard to reindeer, but the facts are not easy to understand. The Newfoundland caribou (*Rangifer terranovae*) moves in autumn from the stormy uplands, where the grazing is apt to be buried deep in snow, to the less strenuous conditions towards the south coast of the island. The southward movement takes place after the mating season, usually late in October, and is normally somewhat leisurely, at a smart walking pace, unless the wintry conditions set in very abruptly. The reindeer travel mostly by day, along more or less well-trodden paths, in relatively small companies, and in single file. The earlier companies consist mainly of does, fawns and young stags, while the later companies consist mainly of the big stags. In the spring there is a return movement, when the does are heavy with young, which is somewhat divergent from avian migration. Too much must not be made of this difference, yet it must be admitted that the so-called reindeer "migration" approximates to the mass-movements of gregarious ungulates of steppe-like areas when the dry season compels them to "follow the grass." Moreover some caribous are practically resident both in northern and southern Newfoundland. There is no doubt that some bats take gregarious flights on a large scale, while others may pass in crowds every evening from the mainland to an adjacent island, just as starlings do. But it is doubtful whether these mass-movements can be included within the rubric of migration.

Reptiles.—Some of the marine turtles are good instances of true migrants. Thus the loggerhead (*Caretta caretta*), a carnivorous species of tropical and intertropical seas, visits many sandy shores to deposit the eggs on the beach. The newly hatched young make persistently for the sea, moved, as G. H. Parker has shown, by a constitutional obligation to go down a slope and to walk in the direction of the most open low horizon. The vegetarian green turtle (*Chelone midas*), which deposits its eggs on sandy beaches in the West Indies, has a migrational range not known to exceed 50 miles. It spends ten months of the year in the relatively shallow coastal waters, for though sometimes found in the open ocean, its normal haunt is bound to be not very far from the seaweed-growing region. Some of the sea-snakes are true migrants, coming periodically to shore to give birth to their young among the rocks.

Amphibians.—A familiar sight in spring in some places is the march of toads from a considerable distance to a particular pond or marsh where they breed. When, some months later, the tadpoles have become small toads, there is a journey in the opposite direction, the parents having returned inland some time previously. The same is true of the crested newt in Britain, but the distances covered are not so great. Similarly in the common grass frog there is a summer movement from the water to the fields. The return to the water, or to the vicinity of the water, is autumnal, not vernal, as in toads, and it is not so well-defined.

Fishes.—The term migration has been mistakenly applied to many mass-movements of fishes, *e.g.*, herring and mackerel, which have no connection with a return to a particular spawning-ground or type of spawning-ground. These non-migrational movements are largely explicable in terms of changes in the distribution of the planktonic and other organisms on which the fishes feed, or what may come to the same thing, in terms of changes in temperature, salinity, oxygenation, carbon dioxide tension, and so forth. No mass-movement of fishes should be ranked as migrational unless directly concerned with approaching or leaving a spawning area.

True migration is familiarly illustrated in the salmon (*Salmo salar*). The eggs are liberated, often in midwinter, on suitable gravelly stretches of the river-bed. There are successive stages of alevins, fry, parr and smolts. The last, when over two years old, pass down the rivers to the sea, usually in early summer. A vigorous nutritive life is spent in the sea, where the food consists largely of herrings and mackerel; the salmon may remain there for several years. Adolescent salmon, which have not quite put on the adult characters are called grilse, and are normally three or three and a half years old, having descended to the sea as smolts the previous year. These may ascend the rivers and may spawn as grilse; but the grilse stage is often passed through in the sea, so that the maiden fish entering the fresh water for the first time are often "salmon." The adult salmon eat very little, if at all, in fresh water; they return to the sea, if they can, after spawning. In some cases it has been proved by marking that salmon return from the sea to their own particular native river (*see* SALMON).

When a migratory fish comes inshore or ascends the rivers to spawn, the term anadromous is used, with its counterpart catadromous, when the spawning occurs in deepish salt water; other useful terms for different types of movement have been defined by Meek. The researches of Schmidt show that the chief breeding area of the European eel, *Anguilla anguilla*, is in deepish water in the south-western part of the north Atlantic, somewhat north of the West Indies. Thence the transparent larvae (leptocephali) gradually make their way, helped by currents, towards the European coasts. As they approach, being over two years and a half old, and having traversed, it may be, 2,000 miles, they undergo a remarkable metamorphosis, from a knife-blade-like to a slender cylindrical shape, and are then known as elvers. These ascend the rivers and often pass to lakes, feeding voraciously and growing quickly, continuing their nutritive life for 5–8 years, the females taking longer to assume the characters of maturity. The physiological restlessness that then sets in prompts a migration down the rivers and out to sea, a journey taking several months. Adult eels seem to die after spawning, so that there is no return journey to fresh water except for the next generation (*see* EEL).

Similarly the large marine lamprey, *Petromyzon marinus*, ascends the rivers to spawn and succumbs soon afterwards. The larvae remain larvae, known popularly as "niners," technically as "Ammocoetes," for three years or so, and then, assuming the adult characters, they go down to the sea to put on flesh. The basal fact in the interpretation must be that lampreys were originally freshwater animals, as most of the lamprey species always are, whereas the common eel had originally a deep-water marine home, and took secondarily to fresh waters. In the interior of New York State *Petromyzon marinus* does not go down to the sea, but passes from river to lake, and from lake to river. Such secondary telescopings of the typical life-history are very significant.

Invertebrates.—Most of the so-called migrations of invertebrates are misunderstandings. The great flocks of butterflies, and dragonflies and other insects that have been described are very impressive, but all the evidence is in favour of regarding them as occasional dispersal movements. On the other hand, there is genuine migration in the movements of land-crabs (*Geocarcinus*) and robber-crabs (*Birgus*) from the interior to the shore. In the sea the larvae are hatched out, and in the sea all the youthful stages are passed. From the sea there is a return of the adults to their inland retreats, and later on they are followed by their offspring.

MIGUEL, MARIA EVARIST (1802–1866), usually known as DOM MIGUEL, whose name is chiefly associated with his pretensions to the throne of Portugal, was the third son of King John VI. of Portugal, and of Carlota Joaquina, one of the Spanish Bourbons; he was born at Lisbon on Oct. 26, 1802. In 1807 he accompanied his parents in their flight to Brazil. In 1822 his father swore fidelity to the new Portuguese constitution which had been proclaimed in his absence; and this led Carlota Joaquina, who was an absolutist of the extremest Bourbon type, and hated her husband, to seek his dethronement in favour of Miguel her favourite son. The insurrections which ensued (*see* PORTUGAL) resulted in

her imprisonment and the exile of Miguel (1824), who spent a short time in Paris and afterwards lived in Vienna, where he came under the teaching of Metternich. On the sudden death of John VI. in May 1826, Pedro of Brazil, his eldest son, renounced the crown in favour of his daughter Maria da Gloria, on the understanding that she should become the wife of Miguel. Miguel swore allegiance to Pedro, to Maria, and to the constitution which Pedro had introduced, and was appointed regent in July 1827. He arrived in Lisbon in Feb. 1828, and, regardless of his promises, dissolved the new Cortes in March; having called together the old Cortes, with the support of the reactionary party of which his mother was the ruling spirit, he got himself proclaimed sole legitimate king of Portugal in July. His private life was characterized by the wildest excesses, and he used his power to oppose all forms of liberalism.

The public opinion of Europe became more and more actively hostile to his reign, and after the occupation of Oporto by Dom Pedro in 1832, the destruction of Miguel's fleet by Captain (afterwards Sir Charles) Napier off Cape St. Vincent in 1833, and the victory of Saldanha at Santarem in 1834, Queen Christina of Spain recognized the legitimate sovereignty of Maria, and in this was followed by France and England. Dom Miguel capitulated at Evora on May 29, 1834, renouncing all pretensions to the Portuguese throne. He lived for some time at Rome, where he enjoyed papal recognition, but afterwards retired to Bronnbach, in Baden, where he died on Nov. 14, 1866.

MIHALACHE, ION (1882–), Rumanian politician, was born on March 3, 1882. In 1914 he entered politics, and after the World War founded the Peasant (Tsaranist) party first in Bessarabia, and then extended its organization to the rest of the country. In the first elections held after the war in 1919, the Peasant party won 70 seats in the Chamber of Deputies and Mihalache was appointed minister of agriculture in the Vaida-Voivod cabinet, which office he held until March 1920, when Vaida-Voivod resigned with the entire cabinet. He remained one of the leaders of the combined National-Tsaranist oppositional bloc.

MIHRAB, a term in Mohammedan architecture given to the niche which in a mosque indicates the direction of Mecca; sometimes called prayer niche.

MIKADO (Japanese for "exalted gate") is the poetical title associated by foreign countries with the sovereign of Japan; the Japanese title, corresponding to "emperor," is *tennō*. The history of the mikados takes us back to very early times, but from 1600 to 1868 the real power was in the hands of the shoguns, who nevertheless were in ceremonial theory always successively invested with their authority by the mikado. The revolution of 1867 restored the real power into the mikado's hands. (*See* JAPAN: *History;* and MEIJI TENNŌ.)

MIKIR, a hill tribe, numbering some 90,000, in Central Assam, calling themselves Arleng. Racially they appear intermediate between the Naga and Kuki groups. Their language, unwritten, belongs to the Tibeto-Burman group. The religious belief is animistic, showing marked Hindu influence. The dead are burned with dancing and ceremony after retention in the house for the period required for the necessary arrangements. True Mikir dress closely resembles that of their neighbours the Khasis, but Assamese dress is now common. The tribe is divided into patrilineal exogamous clans. Villages are small and houses are built on piles. For cultivation, the jungle on the hillsides is cleared and burned. (J. P. M.)

See Lyall and Stack, *The Mikirs* (1908).

MIKKELSEN, EJMAR (1880–), Danish explorer, was born on Dec. 23, 1880, and educated in Copenhagen. He went to sea in 1894, and afterwards travelled extensively. He joined many expeditions of exploration; to the east coast of Greenland (with Amdrups, 1900); to Franz Joseph's Land (Baldwin-Ziegler, 1901–02); in the northern Atlantic (International Hydrographic expedition, 1903–04); north of Alaska (in joint command with Leffingwell, 1906–08); north-eastern Greenland (in command, 1909–12). In 1924 he commanded an expedition to Scoresby sound, and in the following year an experimental fishing cruise to west Greenland. He has published several accounts of the expeditions in which he took part.

MIKLOSICH, FRANZ VON (1813–1891), Austrian philologist, was born at Luttenberg, Styria, on Nov. 29, 1813. He graduated at the university at Gratz, and was for a time professor of philosophy there. In 1838 he went to Vienna, where he took the degree of doctor of law. He gave up law for the study of Slavonic languages and from 1844–62 held a post in the imperial library. His works revolutionized the study of Slavonic languages. From 1849 to 1886 Miklosich occupied the newly created chair of Slavonic philology at the university of Vienna. He became a member of the Academy of Vienna and the upper house. His writings deal also with Rumanian, Albanian, Greek, and the language of the gypsies. Miklosich died on March 7, 1891.

His numerous works include a noteworthy review of Bopp's *Comparative Grammar* (1844).

MIKULOV, a town in Moravia, Czechoslovakia, near the Austrian frontier at the foot of the Pavlovske hills. The town is mainly of local importance by reason of viticulture, cloth manufacture and the Jurassic limestones in the vicinity which are burnt for lime. The principal feature is the Heiliger Berg which has 16 chapels and a church in Byzantine style. Pop. (1923), 7,699.

MILAN (Ital. *Milano,* Ger. *Mailand,* anc. *Mediolanum, q.v.*), city, Italy, capital of the province of Milan, 93 m. by rail E.N.E. of Turin. Pop. (1921) 816,986 (town); 836,046 (commune). It is the seat of an archbishop, the headquarters of the III. army corps, the chief financial centre of Italy and the wealthiest manufacturing and commercial town in the country. It stands on the little river Olona, near the middle of the Lombard plain, 400 ft. above sea-level.

The plain around Milan is extremely fertile, owing to the richness of the alluvial soil deposited by the Po, Ticino, Olona and Adda, and to the excellent system of irrigation. From the cathedral roof, it presents the appearance of a vast garden divided into square plots by rows of mulberry or poplar trees. To the east, this plain stretches in an unbroken level, as far as the eye can follow it, towards Venice and the Adriatic; on the southern side the line of the Apennines from Bologna to Genoa closes the view; to the west rise the Maritime Cottian and Graian Alps, with Monte Viso as their central point; while northward are the Pennine, Helvetic and Rhaetian Alps, of which Monte Rosa, the Saasgrat and Monte Leone are the most conspicuous features. In the plain itself lie many small villages and here and there a larger town like Monza or Saronno, or a great building like the Certosa of Pavia makes a white point upon the greenery.

The summer is intensely hot, winter very cold, snow is often seen, and the thermometer is frequently below freezing-point.

In shape Milan is a fairly regular polygon (within which the still smaller rectangular nucleus of the Roman city may be recognized: *see* MEDIOLANUM), and its focus is the splendid Piazza del Duomo, from which a number of streets radiate in all directions, connected by an inner system of streets, constructed just outside the canal which marks the site of the town moat (the arches of Porta Nuova are almost the last trace of the inner circuit, constructed after the destruction of the city by Frederick Barbarossa, to which also belonged the Porta dei Fabbri, demolished in 1900), and by an outer circle of boulevards, just beyond the outer enceinte of the city, erected by the Spaniards in the 16th century. But the city is growing far beyond these, and in 1926 its circumference was about 8 miles.

At one end of the Piazza del Duomo is the cathedral. It is built of brick cased in marble from the quarries which Gian Galeazzo Visconti gave in perpetuity to the cathedral chapter. Begun in 1386, it was then the largest church in existence, and now, after St. Peter's at Rome and the cathedral of Seville, it is the largest church in Europe; it covers an area of 14,000 sq.yd. and can hold 40,000 people. The interior is 486 ft. long, 189 ft. wide; the nave is 157 ft. high, and the distance from the pavement to the top of the tower is 356 ft. The style is very elaborate Gothic, but the work was continued through several centuries and after many designs by many masters, notably by

Amadeo, who carried out the octagonal cupola (the pinnacle of which dates from 1774), and by Tibaldi, who laid down the pavement and designed a baroque façade, begun after his death in 1609, but only completed, by Napoleon's orders, in 1805–13. The church is cruciform, with double aisles to the nave and aisles to the transepts. The roof is supported by fifty-two pillars with canopied niches for statues instead of capitals; the great windows of the choir have stained glass of 1844. To the right of the entrance is the tomb of Archbishop Aribert (1045), while beside him rests Archbishop Otto Visconti (1295). In a crypt under the choir lies the body of the cardinal saint Carlo Borromeo, who consecrated the cathedral in 1577. It is contained in a rock-crystal shrine, encased in silver, and is vested in magnificent robes blazing with jewels. The roof of the cathedral is built of blocks of marble, and the various levels are reached by staircases carried up the buttresses; it is ornamented with a profusion of turrets, pinnacles and statues, of which last there are 4,440, of various styles and periods.

There are two noteworthy palaces in the Piazza del Duomo. The first is the former Palazzo Reale (now belonging to the municipality) dating from 1772, but occupying the site of the earliest mansion of the Viscontis and the Sforza; its great hall is a handsome chamber with a gallery supported by caryatides. Built into the palace is the ancient church of San Gottardo (1330–36), a Romanesque building built by Azzone Visconti in 1328–1339, and the scene of the murder of Giovanni Maria Visconti in 1412. Its campanile is a beautiful example of early Lombard terra-cotta work. The second palace is that of the archbishops, with a fine façade. It has a fine court with double colonnades. The Palazzo della Ragione, in the Piazza dei Mercanti, just west of the Piazza del Duomo, the central point of the mediaeval city, is a brick edifice (1223–1238) with portico on the ground floor and a large hall on the upper. Close by to the south is the beautiful Loggia degli Osii, erected in 1316, with two open porticos, one above the other, in black and white marble.

Among the most interesting buildings in Milan is the historic church of S. Ambrogio. The church was built by St. Ambrose in 386–389, but as it stands it is a Romanesque basilica of the 11th–12th century, with a brick exterior, galleries over the façade, and perhaps the most perfectly preserved atrium in existence. The wooden door belongs to the original 4th century church; it has carvings with scenes from the life of David. The pulpit is also fine (11th–13th cent.). In a great silver reliquary (modern) in the crypt lie the bones of St. Ambrose, above which rises the high altar, which retains its original reliefs in gold and silver enriched with enamel and gems, and are the work of one Vuolfvinus, a German (835). The baldacchino, with sculptures of the 12th or early 13th century, is borne by four ancient columns of porphyry, with 9th-century capitals. In the tribune are fine mosaics of the 12th century, and in the Basilica Fausta mosaics of the 5th. The lofty brick campanile (789–824) is among the earliest in Italy. The court of the neighbouring canonica is by Bramante. S. Lorenzo, in the south portion of the town, dates from before A.D. 538, but was several times burnt down and restored. The chapel of S. Aquilino, possibly part of the original structure, contains mosaics of the 5th or 6th century; while excavations have shown that its foundations, and apparently those of the whole church, rest upon a mass of architectural fragments taken from Roman buildings; the pavement of a bath was laid over them at a later date, and over this again the chapel was built. In plan the church is an octagon, supported at the corners by four square towers in brickwork. The interior with its two orders is a very fine one, and its influence on Renaissance architects has been very considerable. The portico outside it with its 16 Corinthian columns is a later addition, with use of ancient materials. S. Eustorgio, one of the largest Gothic churches in Milan, dates, as it stands, with its campanile, from the 13th century. It has some interesting mediaeval sculpture, and a fine chapel (Cappella Portinari), with a good dome and a beautiful frieze of angels (1462–1468), and containing the splendid sculptured tomb of Peter Martyr (*q.v.*), the masterpiece of Giovanni di Balduccio of Pisa (1339).

S. Vincenzo in Prato (835); S. Satiro, founded in 879; S. Babila, etc., are interesting for their Romanesque architecture. The small domed structure on the left of S. Satiro is earlier than the church, while the campanile is part of the original structure. The reconstruction of the church of S. Satiro was Bramante's earliest work in Milan (after 1476). The choir is painted in perspective (there was no room to build one), the earliest example of this device, which was so frequently used in baroque architecture. The octagonal sacristy (before 1488), has niches below and a gallery above, and stucco decorations by Bramante himself (the frieze with putti and medallions is by Agostino de Fondotis of Padua). The Cistercian abbey-church of Chiaravalle, 5½ m. south of Milan, is a fine brick building in the plan of a Latin cross, with nave and two aisles with round pillars, with a lofty domed tower, in the so-called Romanesque Transition style, having comparatively slender round pillars and cross vaulting, while the exterior is still quite Romanesque. It was founded in 1135 by St. Bernard and consecrated in 1221. It is interesting as the model for the plan of many other churches in Lombardy, *e.g.*, S. Maria del Carmine and S. Francesco in Pavia. S. Maria Incoronata is unique as a double Gothic church, in the horizontal sense (1451–1487).

Of secular buildings of the beginning of the 15th century, the most notable is the Casa dei Borromei, which still preserves its Gothic courtyard. It has a good collection of Lombard pictures. The Gothic church of Santa Maria delle Grazie was built by the Dominicans about 1460. The choir, crossing, and dome, with elegant external decorations in terra-cotta and marble, are by Bramante (*c.* 1492). Adjoining the church is the convent, with fine cloisters, by Bramante; in the former refectory Leonardo da Vinci (*q.v.*) painted his celebrated "Last Supper."

The interior of San Maurizio has effective frescoes by Luini and his contemporaries. It was erected by Giovanni Dolcebuono, a pupil of Bramante, to whom is also due S. Maria presso S. Celso (the interior and the baroque façade are by Alessi to whom the fine church of S. Paolo is also due). The renowned Biblioteca Ambrosiana, rich in mss., was erected in 1603–1609 by Fabio Manzone, to whom the Palazzo del Senato is also due. There is also a picture gallery, in which is Raphael's cartoon for his fresco the "School of Athens" in the Vatican. The Ospedale Maggiore was founded in the reign of Francesco Sforza. The entire edifice is covered externally with terra-cotta; its façade was designed by the Florentine Antonio Averulino and begun in 1457.

The city is rich in works of art, for Milan, with the introduction of the early Renaissance style by Filarete and Michelozzo after 1450, became the home of a Lombard school of sculpture among the chief masters of which may be mentioned Giovanni Antonio Amadeo of Pavia (1447–1522), Cristoforo Solari, and, the last of them, Agostino Busti, known as Bambaia (*c.* 1480–1548) whose work may be seen in the cathedrals of Como and Milan and in the Certosa of Pavia.

Towards the close of the 15th century, the refined court of Lodovico Sforza attracted such celebrated men as Bramante, the architect; Gauffino Franchino, founder of one of the first musical academies, and the immortal Leonardo da Vinci from whose school came a number of brilliant artists. Later Leone Leoni of Arezzo achieved fame as a sculptor.

The picture gallery of the Brera occupies an imposing palace with a good courtyard by Ricchini. It also contains a library of some 350,000 volumes, a collection of coins numbering about 60,000, and an observatory. The Brera Gallery possesses Raphael's famous "Sposalizio," many pictures and frescoes by Luini, Gaudenzio Ferrari and Bramantino; and a collection of the works of Carlo Crivelli (*fl.* 1480), while the Venetian school is well represented by works of Paolo Veronese, Paris Bordone, Gentile Bellini, Cima da Conegliano, Bonifazio, Moroni and Carpaccio.

The Castel Sforzesco, or Castle of Milan, stands in the Parco Nuovo; it was built in 1450 by Francesco Sforza on the site of one erected by Galeazzo II. Visconti (1355–1378) and demolished in 1447 by the populace after the death of Filippo Maria Visconti.

After many vicissitudes it was restored—including especially the splendid entrance tower by Antonio Averulino (Filarete, 1451–1453), destroyed by a powder explosion in 1521—in the 15th-century style, and it is now a most imposing pile. Some fine windows with terra-cotta decorations are preserved. The archaeological museum is housed here: it contains Roman antiquities and mediaeval and Renaissance tombs and sculptures. Several rooms bear traces of the decorations executed under Galeazzo Maria and Lodovico il Moro. (*See* LEONARDO DA VINCI.) In the upper rooms is placed a large collection of Milanese and central Italian ceramics, stuffs, furniture, bronzes, ivories, enamels, glass and historical relics, with a picture gallery.

The finest modern thoroughfare is the Via Dante (1888), running from the Piazza de' Mercanti to the spacious Foro Bonaparte, and thence to the Parco, a great public garden in which stands the Castello Sforzesco.

To the north of the castle is the Arena, a kind of circus erected by Napoleon in 1806; while facing the castle on the opposite side of the park is the Arco della Pace, begun by Napoleon in 1806, but finished by the Austrians in 1833. The Piazza del Duomo, the centre of Milanese traffic, is connected with the neighbouring Piazza della Scala by the famous Galleria Vittorio Emanuele (1865–67), a great arcade in the form of a Latin cross, with an octagon in the centre, crowned at the height of 160 ft. with a glass cupola; it is roofed with glass throughout, and is 320 yd. long, 16 yd. wide and 94 ft. high.

Near the Piazza della Scala is the Museo Poldi-Pezzoli, with valuable pictures, textile fabrics, arms, armour and antiquities. In the middle of the neighbouring Piazza della Scala stands Magni's monument of Leonardo da Vinci (1872). Opposite is the celebrated Teatro della Scala, built in 1778 on the site of a church founded by Beatrice della Scala, wife of Bernabò Visconti. After the San Carlo at Naples it is the largest theatre in Europe, and can seat 3,600 spectators. It has an interesting theatrical museum. Looking on to the piazza is the fine Palazzo Marino, the seat of the municipality since 1861; it was built by Galeazzo Alessi in 1558, to whom the side façade and the court are due, but was not completed until 1890, when the main façade was erected by Luca Beltrami. S. Fedele by Tibaldi (1569) is close by. Milan has a university, a large school of engineering, the Bocconi commercial university, and numerous other learned and educational institutions; it has long been a great musical centre. A Verdi museum has been formed. There are many philanthropic institutions, and public charities and services are particularly well administered. Sport and athletics are provided by a number of clubs, notably the Touring Club Italiano, founded in 1894.

Modern industrial development includes construction of locomotives, railway trucks and carriages, steam-boilers and motors, turbines, pumps, metal bridges and roofs. Minor industries are represented by workshops for the production of surgical, musical and geodetic instruments; of telephone and telegraph accessories; dynamos, sewing-machines, bicycles and automobiles and chemicals. In textile industries silk (including artificial silk) holds the first place. Spinning and twisting are as highly developed as the weaving industry. Milan is also the centre of the Italian cotton industry. Cotton-weaving, dyeing and printing are extensively carried on. Linen, flax, jute and wool are also spun and woven. The Milanese manufactures of articles in caoutchouc and of electric cables have acquired a world-wide reputation. In typography Milan is renowned principally for its musical editions and for its heliotype and zincotype establishments. The manufacture of furniture of all kinds is still extensively carried on, Milan being the chief Lombard market and centre of exportation. The towns of Cantù, Meda, Lissone and Carugo supply Milanese firms with most of their merchandise, the furniture being made by the workmen at their own homes with materials supplied by the Milanese buyers, who also advance the capital necessary for working expenses. Theatrical costumes and appliances are also made in Milan, which is an important theatrical centre. House industry is still widely diffused in Milan itself, especially as regards working in gold, silver, vulcanite, bronze and leather. The motive power for much of the industry is supplied by electricity. Milan is also a centre of the export trade in cheese; chocolate, biscuits, etc., are also manufactured. Knitted underwear, fringes, tulles, velvets, gloves, shawls, passementerie, jewellery, etc., are produced besides.

The municipal schools of Milan are well organized; the expenditure on them in 1928 was nearly £5,000,000.

The water supply, from wells some 150 ft. deep in the sub-soil, is fairly good; one of the towers of the Castello Sforzesco is used as a distributing centre, while the sewerage system consists of 48 m. of sewers on the single channel principle, with collectors discharging into the Vettabia, a tributary of the Lambro.

See F. Malaguzzi Valeri, *Milano*, 2 vols. (Bergamo, *Arti Grafiche* 1906) well illustrated.

History.—(For earlier history *see* MEDIOLANUM.)—After the establishment of the Lombard capital at Pavia in 569 Milan remained the centre of Italian opposition to the foreign conquest. The Lombards were Arians, and the archbishops of Milan from the days of Ambrose had always been orthodox. Though the struggle was unequal, their attitude of resolute opposition to the Lombards gained for them great weight among the people, who felt that their archbishop was a power round whom they might rally for the defence of their liberty and religion. When the Lombard kingdom fell before the Franks under Charles the Great in 774, the archbishops of Milan were still further strengthened by the close alliance between Charles and the Church, which tended to confirm their temporal authority, and also by Charles's policy of breaking up the great Lombard fiefs and dukedoms, for which he substituted the smaller counties. Under the confused government of Charles's immediate successors the archbishop was the only real power in Milan. But there were two classes of difficulties in the situation, ecclesiastical and political; and their presence had a marked effect on the development of the people and the growth of the commune, which was the next stage in the history of Milan. On the one hand the archbishop was obliged to contend against the heretics or against fanatical reformers who found a following among the people; and on the other, since the archbishop was the real power in the city, the emperor, the nobles and the people each desired that he should be of their party; and to whichever party he did belong he was certain to find himself violently opposed by the other two. From these causes it sometimes happened that there were two archbishops, and therefore no central control, or no archbishop at all, or an archbishop in exile. These difficulties developed a spirit of independence and a capacity of judging and acting for themselves in the people of Milan. The terror of the Hunnish invasion, in 899, further assisted them in their progress towards freedom, for it compelled them to take arms and to fortify their city, rendering Milan more than ever independent of the feudal lords who lived in their castles in the country. The tyranny of these nobles drove the peasantry and smaller vassals to seek protection for life and property and equality of taxation and of justice inside the walled city and under the rule of the archbishop. Thus Milan grew populous, and learned to govern itself. Its inhabitants became for the first time Milanese, attached to the standard of St. Ambrose—no longer subjects of a foreign conqueror, but a distinct people, with a municipal life and prospects of its own. For the further growth of the commune, the action of the great archbishop, Heribert (1018–45), the establishment of the carroccio, the development of Milanese supremacy in Lombardy, the destruction of Lodi, Como, Pavia and other neighbouring cities, the Lombard league, and the battle of Legnano, *see* the articles ITALY and LOMBARDS.

After the battle of Legnano, in 1174, although the Lombard cities failed to reap the fruit of their united action and fell to mutual jealousy once more, the city of Milan began to grow in material prosperity. After the Peace of Constance (1183) the city walls were extended; the arts flourished, each in its own quarter, under a syndic who watched the interests of the trade. The manufacture of armour was the most important industry. During the struggles with Barbarossa, when freedom seemed on the point of being destroyed, many Milanese vowed themselves, their goods and their families to the Virgin should their city come safely out of her troubles. Hence arose the powerful fraternity of the "Umiliati," who established their headquarters at the Brera, and

began to develop the wool trade, and subsequently gave the first impetus to the production of silk. From this period also date the irrigation works which render the Lombard plain a fertile garden. The government of the city consisted of (*a*) a parlamento or consiglio grande, including all who possessed bread and wine of their own—a council soon found to be unmanageable owing to its size, and reduced first to 2,000, then to 1,500 and finally to 800 members; (*b*) a credenza or committee of 12 members, elected in the grand council, for the despatch of urgent or secret business, (*c*) the consuls, the executive, elected for one year, and compelled to report to the great council at the term of their office.

The bitter and well-balanced rivalry between the nobles and the people, and the endless danger to which it exposed the city owing to the fact that the nobles were always ready to claim the protection of their feudal chief, the emperor, brought to the front two noble families as protagonists of the contending factions—the Torriani of Valsassina, and the Visconti, who derived their name from the office of delegates which they had held under the archbishops. After the battle of Cortenova, in 1237, where Frederick II. defeated the Guelph army of the Milanese and captured their carroccio, Pagano della Torre rallied and saved the remnants of the Milanese. This act recommended him to popular favour, and he was called to the government of the city—but only for the distinct purpose of establishing the "catasta," a property tax which should fall with equal incidence on every citizen. This was a democratic measure which marked the party to which the Torriani belonged and rendered it hateful to the nobility. Pagano died in 1241. His nephew Martino followed as podestà in 1256, and in 1259 as signore of Milan—the first time such a title was heard in Italy. The nobles who had gathered round the Visconti, and who threatened to bring Ezzelino da Romano, the Ghibelline tyrant of Padua, into the city, were defeated by Martino, and 900 of their number were captured. Martino was followed by two other Torriani, Filippo his brother (1263–65) and Napoleone his cousin (1265–77), as lords of Milan. Napoleone obtained the title of imperial vicar from Rudolph of Habsburg. But the nobles under the Visconti had been steadily gathering strength, and Napoleone was defeated at Desio in 1277. He ended his life in a wooden cage at Castel Baradello above Como.

Otto Visconti, archbishop of Milan (1262), the victor of Desio, became lord of Milan, and founded the house of Visconti, who ruled the city—except from 1302 to 1310—till 1447, giving 12 lords to Milan. On the death in that year of Filippo, the last male of the Visconti house, a republic was proclaimed, which lasted only three years. In 1450 the general Francesco Sforza, who had married Filippo's only child Bianca Visconti, became duke of Milan by right of conquest. Francesco was followed by five of the Sforza family, and from the death of the last (1535) till the War of the Spanish Succession (1714) Milan was a dependency of the Spanish Crown. At the close of that war it was handed over to Austria, under whose rule it remained until the Napoleonic campaign of 1796. For the results of that campaign, and for the history of Italian progress towards independence, in which Milan played a prominent part, *see* ITALY. The Lombard campaign of 1859, with the battles of Solferino and Magenta, finally made Milan a part of the kingdom of Italy.

MILAN DECREE, an order issued by Napoleon on Dec. 17, 1807, extending the ban upon British goods inaugurated by the Berlin Decree (*q.v.*) of Nov. 21, 1806, and forbidding neutrals to trade in goods imported from British dominions. (*See* CONTINENTAL SYSTEM.)

MILANESI, GAETANO (1813–1895), Italian scholar and writer on the history of art, was born at Siena, where he studied law, and in 1838 he obtained an appointment in the public library. In 1856 he was elected member of the Accademia della Crusca, in which capacity he took part in the compilation of its famous but still unfinished dictionary, and two years later was appointed assistant keeper of the Tuscan archives, in Florence; then he took charge of the famous Medici archives, whence he collected a vast body of material on the history of Italian art. In 1889 he became director of the archives, but retired in 1892. His most important publication is his edition of Vasari's works in nine volumes, with copious and valuable notes (Florence, 1878–1885). Of his other writings the following may be mentioned: *Il diario inedito di Alessandro Sozzini* (in the *Archivio storico Italiano*, 1842); *Documenti per la storia dell' arte senese*, 3 vols. (Siena, 1854–56) and *Discorsi sulla storia civile ed artistica di Siena* (Siena, 1862). He also edited a number of Italian classics.

See E. Ridolfi's article in the *Nuova antologia* (May 15, 1895); and A. Virgili's article in the *Atti della regia Accademia della Crusca* (Florence, 1898); also Dom. Colnaghi's *The Dictionary of Florentine Painters* (1928) contains much material which Milanesi collected.

MILAN OBRENOVIĆ IV. (1854–1901), king of Serbia, was born at Jassy, Rumania, on Aug. 22, 1854, son of Miloš Obrenović (1829–1861), the nephew of Prince Miloš I. (*q.v.*), and Maria Katardži, a Moldavian. Early left an orphan, Milan was adopted by his cousin Michael (*q.v.*), educated at Bucharest and Paris, and placed on the throne under a regency, in 1868, on the assassination of Michael. In 1872 he came of age, but retained the Liberal regent, Ristić, as his premier. For the events of his rule as prince *see* EASTERN QUESTION and SERBIA. He proclaimed himself king in 1882.

Milan's Austrophile policy was deeply unpopular, particularly as taxation had become a burden; military service increased and the king's private life was extravagant and unsavoury. In 1875 he had married Natalie, the 16-year old daughter of Colonel Ketčko, a Moldavian in the Russian army. After the birth of their son Alexander (1876), relations between the couple became notoriously strained, and the Russophile party rallied round Natalie. In 1885 Milan embarked on an ill-judged, undesired and ignominious campaign against Bulgaria, being saved from disaster only by Austria's intervention. In 1886 the queen withdrew with her son to Wiesbaden; but in 1888 Milan recovered his son, circulated nauseous scandals about his wife, and finally extorted a divorce, which was illegal in the eyes of the orthodox church. In an attempt to recover his popularity, he suddenly promulgated a new and liberal constitution (Jan. 2, 1889); but on March 6 abdicated in favour of his son, and retired to Paris. In 1892 he renounced his Serb nationality. In Jan. 1894 he reappeared in Belgrade, and on April 29 he and Natalie were reinstated and nominally reconciled, the queen returning in May 1895. Appointed commander-in-chief of the Serb army in 1897, Milan did some really useful technical work, but also inaugurated a cruel persecution of the Russophiles and Radicals. This period was suddenly checked by Alexander's marriage in July 1900. Milan resigned his post and returned to Vienna, where he died unexpectedly on Feb. 11, 1901.

For bibliography, *see* SERBIA: the works of Georgević, *Das Ende der Obrenović* (Leipzig 1905) and *Die Serbische Frage* (Stuttgart, 1909) are detailed for Milan's period and written by a partisan; other literature is more occupied with his ill-doing.

MILÁ Y FONTANALS, MANUEL (1814–1884), Spanish scholar, was professor of literature at Barcelona from 1845 until his death. He was the author of *De los trovadores en España* (1866) and *De la poesía heróico-popular castellana* (1874), an epoch-making work in Hispanic studies which revealed its author as a master of scientific method.

MILAZZO, seaport north coast of Sicily, province of Messina, 22 m. W. of Messina by rail. Pop. (1921), 15,605 (town), 20,454 (commune). It is mainly built on the low isthmus of a peninsula, which stretches some 3 m. farther north and forms a good harbour: but the old town, which contains a castle, mainly

the work of Charles V., lies on a hill above. Milazzo is the ancient *Mylae*, an outpost of Zancle, taken by the Athenians in 426 B.C. In the bay Duilius won the first Roman naval victory over the Carthaginians (260 B.C.).

MILDENHALL, a market town of Suffolk, England, 76½ m. N.N.E. from London by rail. Pop. (1921) 3,370. It lies on the edge of Mildenhall Fen. The church of St. Andrew has an Early English chancel. The remainder is principally Perpendicular with a carved oak roof, ornate north porch and lofty tower with fan tracery within. There is a wooden market cross of the 15th century; the manor house is a gabled building of the 17th century. Flour milling is an industry and there are foundries at Stowmarket nearby. Roman remains have been found.

MILDEW, a popular name given to various minute fungi. Like many other popular names of plants, it is used to denote different species which possess very small botanical affinity. The term is applied, not only to species belonging to various systematic groups, but also to such as follow different modes of life. The corn-mildew, the hop-mildew and the vine-mildew are, for example, parasitic upon living plants, and the mildews of damp linen and of paper are saprophytes; *i.e.*, they subsist on dead matter. The conditions of life and growth of mildew are mainly suitable nutrition and dampness accompanied by a high temperature. The life history of the same species frequently covers two or more generations, and these are often passed on hosts of different kinds (*see* FUNGI).

MILES, NELSON APPLETON (1839–1925), American soldier, was born in Westminster, Mass., on Aug. 8, 1839. He was engaged in mercantile pursuits in Boston when the Civil War began, and he entered the army in Sept. 1861, as a lieutenant of volunteer infantry. He served with distinction in the Peninsular campaign, and at Antietam, Fredericksburg and Chancellorsville, where he received a wound which incapacitated him until 1864. He commanded a brigade at the Wilderness and Spottsylvania, and for his gallant leadership was made brigadier-general of volunteers. He fought in the Cold Harbor and Petersburg operations in 1864–65, and at the close of the war was in temporary command of an army corps. In July, 1866, he was made colonel of a regular infantry regiment. He was promoted brigadier-general U.S.A. (Dec. 1880), and to major-general (April 1890), and in 1895 succeeded Gen. John McA. Schofield as commanding general of the United States army. He was conspicuously successful (1869–86) in dealing with Indian outbreaks, fighting the Cheyenne, Kiowa and Comanche on Llano Estacado (1875) and the Sioux in Montana (1876), capturing the Nez Percés under Chief Joseph (1877), and defeating the Chiricahua Apaches under Geronimo (1886), and he commanded the United States troops sent to Chicago during the railway riots in 1894. He was in nominal direction of military operations during the war with Spain in 1898, though his personal share of the operations was confined to directing the almost unopposed Porto Rico expedition. He was raised to the rank of lieutenant-general in 1900, and retired from active service in 1903. He died in Washington, D.C. on May 15, 1925. Miles was one of the youngest Union generals in the Civil War, commanding when only 25 years of age a corps of 26,000 men. He wrote *Personal Recollections* (1896), *Military Europe* (1898), *Observations Abroad* (1899) and *Serving the Republic* (1911).

MILES CITY, a city of eastern Montana, U.S.A., on the south bank of the Yellowstone, at the mouth of Tongue river, 2,377 ft. above sea-level; the county seat of Custer county. It is on Federal highways 10 and 12, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Northern Pacific railways. Pop. (1920) was 7,937, 86% native white; (1930) 7,175 Federal census. It is the metropolis of the stock-raising and agricultural district of eastern Montana, an important range-horse market and distributing point for wool, butter, wheat, corn and other produce. Ranches in the vicinity graze from 10,000 to 20,000 head of sheep and cattle. Adjoining the city is the U.S. Range Livestock experiment station (formerly Ft. Keogh) of 57,000 acres. The Milwaukee has division headquarters and extensive repair shops here, and the manufacturing industries include creameries, bottling works, an oil refinery and two establishments which have a world-wide market for their harness and saddles. Lignite coal is mined for local consumption and natural gas is available. The State Normal School conducts a summer session at Miles City. The Eastern Montana Fair, the State Corn Show and the Miles City Round-Up and Historical Show are annual events. The city's assessed valuation of property in 1928 was $10,500,000. Miles City was founded in 1877 and named after Gen. Nelson A. Miles, an experienced Indian fighter, who had previously built Ft. Keogh two miles west. In the early days the principal industry was the hunting of buffalo, and tradition says that as many as 250,000 hides were shipped in a single season. The first railroad reached the city in 1881.

MILETUS (mod. *Palatia*), an ancient city of Asia Minor, on the southern shore of the Latmic Gulf near the mouth of the Maeander. Before the Ionic migration it was inhabited by Carians (*Iliad* ii. 876; Herod i. 146), and pottery found on the spot proves that the site was inhabited, and had relations with the Aegean world, in Minoan times. The Greek settlers from Pylos under Neleus are said to have destroyed the old city and to have built a new one on the coast. Miletus occupied a very favourable situation at the mouth of the rich valley of the Maeander, and was the natural outlet for the trade of southern Phrygia (Hipponax, *Fr.* 45). It had four harbours, one of considerable size, and its power extended inland for some distance up the valley of the Maeander, and along the coast to the south, where it founded the city of Iasus. Its enterprise extended to Egypt, where it had much to do with the settlement of Naukratis (*q.v.*). Very little "Naucratitic" pottery, however, was found on the site, and only in the Athena temple. The Black Sea trade, however, was the greatest source of wealth to the Ionian cities. Miletus, like the rest, turned its attention chiefly to the north, and succeeded in almost monopolizing the traffic. Along the Hellespont, the Propontis and the Black Sea coasts it founded more than sixty cities—among them Abydus, Cyzicus, Sinope, Dioscurias, Panticapaeum and Olbia. All these cities were founded before the middle of the 7th century; and before 500 B.C. Miletus was decidedly the greatest Greek city. Miletus was equally distinguished at this time as a seat of literature. Thales, Anaximander, Anaximenes and Hecataeus all belonged to this city. The three Ionian cities of Caria—Miletus, Myus and Priene—spoke a peculiar dialect of Ionic.

The Mermnad kings of Lydia found in Miletus their strongest adversary. War was carried on for many years, till Alyattes III. concluded a peace with Thrasybulus, of Miletus; the Milesians afterwards seem to have acknowledged the rule of Croesus. On the Persian conquest Miletus passed under a new master; it headed the Ionian revolt of 500 B.C., and was taken by storm after the battle of Lade. (*See* IONIA.) Darius gave up the city to the Carians. The Persians were expelled from the coast in 479 B.C., Miletus became a member of the Delian League (*q.v.*), revolted to Sparta in 412, passed into Carian hands, and opposed Alexander on his southward march, succumbing to a siege (334 B.C.). It was a town of commercial importance throughout the Graeco-Roman period, and received special attention from Trajan. Its harbours, once protected by Lade and the other Tragasaean islands, were gradually silted up by the Maeander, and Lade is now a hill some miles from the coast. Ephesus took its place as the great Ionian harbour in Hellenistic and Roman times. Miletus became the seat of a Christian bishopric and was strengthened by a Byzantine castle *κάστρον τῶν Παλατίων*, built above the theatre.

Excavation has revealed on the north of the ruins a well-preserved Roman theatre on the site of an older Greek building. Cyriac of Ancona described the building as practically complete in his day (1446). East of this was the ancient north harbour, now silted up, and on the hillside above it stood a large heroon of Hellenistic time. South of the harbour head lies the Hellenistic agora with ruins of large magazines of Doric style. South of these again lie a nymphaeum of the age of Titus, and a senate-house of theatral form. On the east opens a great hall surrounded by porticoes and enclosing a high altar of Artemis, once richly adorned with reliefs. The Roman agora lies beyond this

again. A straight street leads south-west from the north harbour to the Didyma Gate in the wall, which runs across the neck of the peninsula and was rebuilt by Trajan, when he undertook to raise the level of the outer quarters of the city; and streets cross this at right angles in the geometric Hellenistic manner. A Sacred Way lined with tombs led to Didymi. Two temples have been discovered, one, on the south-east, being a sanctuary of Apollo Delphinius. This seems to have been the chief temple of the city. The other temple, an archaic sanctuary of Athena, lies west of the stadium.

See O. Rayet and A. Thomas, *Milet et le golfe Latmique* (1877); Th. Wiegand, "Vorläufige Berichte über die Ausgrabungen in Milet," in *Sitzungsberichte* of the Berlin Academy (1900, foll.); A. von Salis, "Die Ausgrabungen in Milet und Didyma" in *Neue Jahrb. f. d. k. Alt.*, xxv. 2, 1910.

MILFORD, a town of New Haven county, Connecticut, U.S.A., on Long Island sound, at the mouth of the Housatonic river, which separates it from Stratford on the west. It is served by the New York, New Haven and Hartford railroad. Pop. (1930) 12,660. The town occupies 25.5 sq.m., and embraces several villages, including the incorporated borough of Woodmont, a popular summer resort, and other beaches. It is a typical old New England town, with a beautiful green of four acres. Many of the inhabitants are descendants of the first settlers, and in the burying-ground are the tombs of Robert Treat, Jonathan Law and other prominent pioneers. The principal industries are agriculture (especially seed-raising), fisheries and a variety of manufactures.

The town was founded in 1639 by the Rev. Peter Prudden and his followers from New Haven and Wethersfield, and was named after the English city. The land was bought from the Indians for six coats, ten blankets, 12 hatchets, 12 hoes, 24 knives, 12 small mirrors and a kettle. A "Church-State" after the model of New Haven was organized, but the town granted the suffrage to six men who were not church-members, and this created an obstacle to its admission to the New Haven Jurisdiction. It was admitted, however, in 1644, on condition that none of the six should hold office in the Jurisdiction. When the members of the Jurisdiction were absorbed by Connecticut (1664) some of the people of Milford, led by Robert Treat, moved to New Jersey and helped to found Newark. The regicides Whalley and Goffe were concealed in Milford from 1661 to 1664.

MILFORD, a town of Worcester county, Massachusetts, U.S.A., and its chief village, which is on the Charles river, 33 m. S.W. of Boston, and served by the Boston and Albany and the New York, New Haven and Hartford railways. Pop. (1920) 13,471 (28% foreign-born white) 14,741, 1930 (Federal census). Within its area of 15 sq.m. is a considerable rural population. There are large quarries of a pinkish-grey granite, widely used for building purposes, and a number of boot and shoe factories and other manufacturing plants, with an output in 1925 valued at $7,844,387. The town was separated from Mendon and incorporated in 1780. The manufacture of boots and shoes was introduced in 1795, and for many years brogans for southern negroes were a specialty.

MILFORD HAVEN, LOUIS ALEXANDER, 1ST MARQUESS OF (1854–1921), British sailor, was born at Gratz, May 24, 1854, the eldest son of Prince Alexander of Hesse, by his morganatic marriage with the Russian countess, Julie Thérèse von Haucke. As Prince Louis of Battenberg he was naturalized as a British subject in 1868 and entered the royal navy in the same year. In 1884 he married Princess Victoria, daughter of the Grand Duke Louis IV. of Hesse. From 1891 to 1894 he was naval adviser to the inspector-general of fortifications and in 1900 was appointed assistant director of naval intelligence at the Admiralty, being made director in 1902. In 1904 he was promoted rear-admiral and after serving as second in command in the Mediterranean was made vice-admiral in 1908. After commanding the Atlantic and Home Fleets, he was in 1912 appointed First Sea Lord of the Admiralty, but in Oct. 1914 press agitation over his German origin brought about his resignation. In 1917 he relinquished his German titles, assumed the surname of Mountbatten and was elevated to the peerage as marquess of Milford Haven. In the following year he retired from the active list of the navy. He became an admiral of the fleet in 1921 and died on Sept. 11 of the same year. (*See* also BATTENBERG and MOUNTBATTEN.)

MILFORD HAVEN, town and seaport in Pembrokeshire, Wales. Pop. (1931) 10,116. The harbour was important in the middle ages as a port of embarkation for Ireland. Henry Tudor landed here in 1485 on his return from France to win the crown of England and Wales. The Hon. R. F. Greville improved the town in 1790 and a few years afterwards a dockyard was established but, with its transference to Pembroke Dock in 1814, and that of the Irish mail station to Holyhead, and with the temporary development of Neyland higher up the Haven, the town declined, but it is now fairly prosperous as the headquarters of a steam trawling fleet and a fish curing station. Milford Haven itself (Welsh: Aberdaugleddau—"the mouth of the two harbours") is as its Welsh name implies, the estuary of the united East and West Cleddau rivers.

MILHAUD, DARIUS (1892–), French composer, was born at Aix-en-Provence on Sept. 4, 1892. He studied at the Paris conservatoire and became one of the group known as the "Six." His most finished work is to be found in his chamber music, which includes five string quartets, two violin and piano sonatas; a sonata for flute and piano, and one for flute, oboe, clarinet and piano; and a "symphony" for the unusual combination of vocal quartet with oboe and clarinet. For piano with orchestra he has written studies and a *Poem;* and for piano alone a sonata and suites. In his incidental music to various Greek plays he shows an appreciation of tragedy which comes as a surprise to those who know him only as a parodist in *Le train bleu* and as a humorist in *Le Boeuf sur le toit,* with its Brazilian tango. Other ballets are: *La création du monde* and *Salade.* He has also written a "musical novel" for the stage, based on *La brebis égarée* by Francis Jammes. *Saudades de Brazil* is an effective dance-suite for orchestra. Three one-act *Opéras-minutes* were produced at Wiesbaden in 1928. For voice he has written three sets of songs: *Soirées de Pétrograd, Poêmes juifs,* and *Catalogue des fleurs* with chamber orchestra.

MILICZ or **MILITSCH** (d. 1374), Bohemian divine, was the most influential among those preachers and writers in Moravia and Bohemia who were forerunners of Huss. In 1360 he was attached to the court of the emperor Charles IV., and he held a canonry in the cathedral of Prague, with the dignity of archdeacon. About 1363 he resigned all his appointments that he might become a preacher pure and simple; he addressed scholars in Latin, and (an innovation) the laity in their native Czech, or in German, which he learnt for the purpose. He was conspicuous for his apostolic poverty and soon roused the enmity of the mendicant friars. The conviction grew in his mind that the "abomination of desolation" was now seen in the temple of God, and that antichrist had come, and in 1367 he went to Rome (where Urban V. was expected from Avignon) to expound these views. He was thrown into prison by the Inquisition. Urban, however, on his arrival, ordered his release, whereupon he returned to Prague, and from 1369 to 1372 preached daily in the Teyn Church there. He was summoned to the papal court at Avignon in Lent 1374, and died there in the same year, not long after being declared innocent. He was the author of a *Libellus de Antichristo,* written in prison at Rome, a series of *Postillae* and *Lectiones quadragesimales* in Latin, and a similar series of *Postils* (devotional tracts) in Czech.

MILITARY FRONTIER (Ger. Militärgrenze), a former institution and division of the Austro-Hungarian monarchy. When Croatia swore allegiance to the Habsburgs in 1527, after the defeat of Hungary by the Turks at Mohács, Southern Croatia was left half deserted, its inhabitants having fled north before the Turks. The Austrian Government built a series of forts in this zone, and organized the remaining population, with immigrant Serbs and Vlachs, into a defence force under military supervision;

the costs being borne by the Estates of the Austrian provinces proper. This organization was gradually extended, and in 1630 received a formal statute.

By the end of the 17th century, there were three "Generalates," in Karlstadt (Karlovats), Warasdin and Petrinja respectively. The Hungarian and Croat Estates deeply resented the existence of this exception from their authority, and constantly demanded its abolition, especially after Prince Eugène's victories had practically ended the Turkish peril; but the "Grenzer" themselves resisted any change, and the Habsburgs had also now become alive to its usefulness as a weapon against the unruly nobles. Instead of abolishing, they extended it; a new Slavonian district was established in 1702, a Szekler, in East Transylvania, in 1764, and a Wallach in 1766; the Frontier now ran from the Adriatic to the confines of Moldavia.

The "Grenzer" gradually became the backbone of the Austrian army. As its bravest, most loyal and best disciplined troops, they fought in all Austria's foreign campaigns, and under Jellačić took a chief share in crushing the revolutions of 1848–49 in Vienna and Hungary. In 1849 the Frontier was formed into a separate province, with an area of 15,182 sq. m., and a population of 1,220,503, mostly Serb or Croat, with some Vlach or Rumanian. In 1851, however, the eastern portion was incorporated with the rest of Transylvania. The Warasdin frontier passed under civil administration in 1871, the Banat in 1872 and the remainder of the Croat and Slovene districts on July 15, 1881. The tradition, however, remained, and even in the World War the "Grenzer" regiments were comparatively unaffected by nationalist agitation, while a high proportion of Austria-Hungary's highest officers were drawn from the old Frontier.

See F. Vaníček, *Spezialgeschichte der Militärgrenze* (Vienna, 1875); and J. H. Schwicker, *Geschichte der oe. Militärgrenze* (Vienna and Teschen, 1883). (C. A. M.)

MILITARY LAW embraces both a penal code for the maintenance of discipline of the army and also administrative law, which provides for the maintenance of the Army.

It is important to note that in Great Britain the Army Act itself does not take the form of permanent legislation, because it requires to be brought into operation annually by another Act of parliament known as the Army (Annual) Act. In other words, the Army Act is brought up annually for review by parliament and is amended (often considerably).

Administration of Discipline.—The administration of the discipline of the Army is governed not only by the Army Act but by Rules of Procedure (which are made by his majesty in pursuance of the Army Act), by the King's Regulations and by Royal Warrants. The tribunals which dispose of offenders are known as courts martial, of which there are three kinds, (a) general court martial, (b) district court martial, (c) field general court martial (the last is only utilized on active service).

When a soldier is charged with an offence he is, if the offence is deemed serious, placed under close arrest, *i.e.*, he is confined in the guard room in the custody of the non-commissioned officer in charge of the guard. If, on the other hand, the offence is not of a serious nature, he is placed in open arrest, *i.e.*, he is not permitted to leave barracks until his case has been disposed of. The soldier is then brought before his commanding officer who hears the charge, and if it be one he is authorized by the King's Regulations to dispose of, he may either so dispose of it, or he may, if he considers that the punishment which he may award is not sufficient, remand the accused soldier for trial by court martial. If, on the other hand, the offence is not one which he is authorized by the King's Regulations to dispose of, he has no alternative but to remand the soldier for trial by court martial if he thinks that the offence has been committed. On the other hand, however, the commanding officer may, of course, dismiss any charge, if, in his discretion, he thinks it ought not to be proceeded with.

The punishments to which a soldier is liable on conviction by court martial are (1) death, (2) penal servitude (for life), (3) imprisonment, (4) detention, (5) field punishment, (6) discharge with ignominy, (7) if a non-commissioned officer (a) reduction in rank and precedence, (b) reduction in rank, (c) reduction to the ranks, (d) reprimand, (8) fines, (9) stoppages of pay, (10) forfeiture of pay. A warrant officer is liable to similar punishments with slight differences of a technical nature.

Trial by Court Martial.—A court martial is conducted under conditions similar to civil courts. The material difference is that the sentence of the court is not valid until it has been "confirmed" by superior authority. An interesting point in regard to courts martial is that a conviction or an acquittal by a court martial does not bar proceedings being taken for the identical offence in the civil courts. The converse, however, does not apply.

The proceedings of all courts martial are reviewed by the judge-advocate-general who is the legal adviser of the secretary of State. If the proceedings are found by him to be irregular before confirmation, confirmation would be refused and the proceedings thereby nullified. If, on the other hand, the proceedings are reviewed by the judge-advocate-general after confirmation and are found to be invalid they would be quashed by the Army Council and the accused thereby relieved of all consequences of his trial.

In so far as an officer is concerned, his position differs from that of a soldier. First of all the soldier enlists for a particular term of service, which term varies with military requirements. It may be, for example, for seven years with the colours and five years with the reserve, or three years with the colours and nine years with the reserve. On the completion of his term of service the soldier concerned is entitled to be discharged, having completed his engagement. The officer, on the other hand, does not enter into any contract of this nature. When granted a commission by the sovereign he holds that commission at the King's pleasure, and in addition to the penal code to which he is subjected under the Army Act he may be removed from the Army at the king's pleasure, or he may be required to resign his commission, or to retire, under conditions which are indicated in the Royal Warrant for Pay and Promotion.

The penalties to which an officer is liable are (1) death, (2) penal servitude (for life), (3) imprisonment, (4) cashiering, (5) dismissal, (6) reduction in seniority of rank (though this does not involve reduction from a higher rank to a lower rank), (7) reprimand, (8) stoppages of pay.

It was indicated above that the Army Act provided for the rights of officers and soldiers. An officer who thinks himself wronged has a right of appeal either to the Army Council, or through the Army Council to the King. The soldier has a right of appeal through his captain and his commanding officer to a prescribed general officer.

In 1907 the Territorial and Reserve Forces Act was brought into force. This Act was defined as "an Act to provide for the reorganization of his majesty's military forces, and for that purpose to authorize the establishment of county associations and the raising and maintenance of a Territorial Force, and for amending the Acts relating to the reserve forces." In so far as an individual soldier of the Territorial Forces is concerned, this Act provided that men of the Territorial Force should be liable to serve in any part of the United Kingdom, but that no part of the Territorial Force should be carried or ordered to go out of the United Kingdom. The Act also provided that the Army Act should apply to the Territorial Force under the conditions laid down in the Territorial and Reserve Forces Act 1907. For a closer study of this subject reference to the above-quoted Acts is suggested. It is of interest to recall that when this Act was before the House of Parliament grave objection was taken in some quarters to the fact that as the Act stood members of the Territorial Force could be called out for duty in aid of the civil power in the event of riot or disorder, and would, therefore, become "involved" in a trade dispute. A pledge, however, that the Force would not be so used was given by the then secretary of State, and the Bill went through.

The World War.—Punishments inflicted in the field during the World War upon soldiers were (a) death, (b) penal servitude, (c) imprisonment, (d) field punishment (Nos. 1 and 2), (e) forfeiture and stoppages of pay (as also, of course, the minor

punishment of confinement to camp or barracks). Soldiers sentenced to penal servitude were sent to the United Kingdom to undergo their punishment but imprisonment was carried out in so called "military prisons in the field" which were established at the bases. The punishment inflicted in the military prisons in the field consisted actually of deprivation of liberty and other summary punishments which could be awarded by the governor, but did not prevent the carrying out of military training. It was rapidly realized, however, that the withdrawal of soldiers from the Front to undergo terms of imprisonment in the military prisons in the field was a serious menace to the security of the army, and in consequence, in 1915, the Army Suspensions of Sentences Act was passed. Briefly, this act enabled a sentence, no matter how severe, *e.g.*, penal servitude for life, to be suspended, and the offender, therefore, could be retained for duty. The Act still remains in being.

It will be here convenient to make some reference to the methods by which the death penalty was carried out during the World War. The sentence of death can and could only be carried out on active service by the authority and under the confirmation of the general officer commanding in chief. The procedure existing at the outbreak of the War was that the proceedings of the court-martial which sentenced the accused soldier to death were forwarded to general headquarters, where they were reviewed by the judge-advocate-general as to their legality, and were then laid before the commander-in-chief for his decision. All he had to guide him was a copy of the soldier's "conduct sheet," which disclosed his character, together with, possibly, evidence contained in the proceedings as to his character from the soldier's company commander. It was rapidly realized that these particulars provided wholly insufficient data for the commander-in-chief to take a decision of such momentous importance. In consequence, entirely extra judicial procedure was adopted, and a complete picture was presented of the whole circumstances under which the act was committed. The state of discipline of the unit was fully disclosed. The opinion of the various intermediary superior authorities was required as to whether or not the death penalty should be carried out as a deterrent. The fighting value of the unit was brought under consideration, as also that of the soldier concerned, and the soldier's value as a fighting man was made the subject of close investigation and report. Medical opinion and the expert opinion of neurologists was sought, and in cases where nervous breakdown or shell-shock was suggested, the opinion of medical boards was also required. It is gratifying to record that large numbers of soldiers who had been sentenced to death by courts-martial had their sentences commuted and were dealt with under the Army Suspensions of Sentences Act. It is more gratifying to record that 89% of the death sentences which were passed were, in fact, never carried out.

After the War.—Arising out of the experiences of the World War committees set up by the secretary of State for war have sat to consider the difficult question of the infliction of the death penalty for various military offences. As a result the death penalty has been abolished for various military offences and, as an example, it may be mentioned that by amendments of the Army Act of 1928 the death penalty was abolished for the following offences:—(1) leaving his commanding officer to go in search of plunder; (2) forcing a safeguard; (3) forcing or striking a soldier when acting as sentinel; (4) breaking into any house or other place in search of plunder; (5) sleeping or being drunk when acting as sentinel.

During the War also there was much popular feeling evinced against the punishment known as "field punishment" (a definition of which will be found in the *Manual of Military Law*). Field punishment No. 1 no longer exists as it was known at the outbreak of the War, as s. 44 (5) now lays down that field punishment must not take the form of "flogging or attachment to a fixed object." (B. E. W. C.)

United States.—Military law is the body of rules, regulations and doctrines that have been prescribed for the government of the Army and the Navy. In contradistinction to martial law, military law is a permanent code, applicable alike in time of peace and war. It finds its sources in the Constitution of the United States (article I., section 8; article II., section 2, and the Fifth Amendment); in the Articles of War, in Army Regulations, in statutes, general and special orders, circulars and bulletins issued by the military authorities under the direction of the President; in the Manual for Courts-Martial of the United States Army, and in the customs and usages of the service. (These customs and usages are binding only when not in contravention to law. *Martin* v. *Mott,* 12 Wheaton 19.) To these sources of military law should be added the decisions of the courts, the President, the secretary of war, and the opinions of the judge advocate general and the attorney-general. (Davis, *Treatise on Military Law,* 1, 6; 5 Corpus Juris 296.) Army Regulations have the force of law so long as they do not contravene existing law, are not legislative in their nature, and are not inconsistent with treaty obligations. (*United States* v. *Symonds,* 120 U.S. 49; *United States* v. *Webster,* 2 Ware 54.) They must be applicable to the military, be uniform, and not arbitrary or oppressive. (*United States* v. *Mann,* 2 Block 9, 11.) General and special orders issued by the highest authority of the Army are a part of military law. All persons subject to military law are amenable to the government of military law—all officers, cadets, members of the Army nurse corps, warrant officers, and enlisted men.

The first American code was enacted by the Second Continental Congress June 30, 1775, and included sixty-nine articles of war, derived in great part from the British, and was amended on Nov. 7, 1775, by the addition of sixteen provisions. The code of 1806, composed of one hundred and one articles, was the first complete revision of the American code, and remained in force, with few amendments, until 1874. Changes culled from long experience were included in the articles of war of 1920. These new articles provided for a system of appellate review by a board of review and the President for certain general court-martial cases. (Article of War $50\frac{1}{2}$.) They also provided for the appointment upon all general courts of a law member especially equipped to determine questions of law. The articles of war of 1920, introducing many changes in the procedure before courts-martial, with constructive criticism and suggestions, are incorporated in the Manuals for Courts-Martial, United States Army, of 1921 and 1928.

Courts-martial are the tribunals which administer the law in the army. These courts—(a) general courts, (b) special courts, and (c) summary courts (A. W. 3)—appointed by designated military authority, are established under the constitutional power of Congress and are lawful tribunals with penal or disciplinary jurisdiction. They are judicial in their nature. (*Dyne* v. *Hoover,* 61 U.S. 838.) A general court-martial is a court of co-ordinate jurisdiction. Its judgments are entitled to the same respect as res judicata as those of the highest tribunals in the land. (*Grafton* v. *United States,* 206 U.S. 333; *ex parte* Reed, 100 U.S. 13; *Rose* v. *Roberts,* 99 Fed. 948; *Carter* v. *McClaughry,* 183 U.S. 368.) The sentence of a general court confirmed by the President of the United States is altogether beyond the jurisdiction or inquiry of any civil tribunal whatever. (*Smith* v. *Whiting,* 116 U.S. 168; *ex parte* Mason, 105 U.S. 695.) To release a military prisoner from confinement, habeas corpus will not lie unless the sentence under which the soldier is confined is an absolute nullity for want of jurisdiction. (*Ex parte* Watkins, 3 Peters 193. Note in *Bens* v. *United States,* 266 Fed. 152.) (F. W. HA.)

France.—French military law comprises the Law on the organization of the nation in time of war, on the general organization of the Army, on the constitution of cadres and effectives, and on recruiting for the Army, on the principles of the reduction of compulsory service to one year; the development of the "nation in arms" idea; the respect of international agreements, and the protection of frontiers.

The respect of international agreements led France to work out a rational organization of national defence, which would obviously be as efficient in case of danger as it would be useless for wars of aggression or conquest. At the same time the essential point is adequate defence of the country against aggression.

As a result of the World War the security of French frontiers is to-day an undisputed and universally organized dogma. This security can only be guaranteed by an army sufficient in strength and easily mobilized. For 125 years a conception of "the nation in arms" has been before the public mind.

The "nation in arms" idea is the chief outcome of the World War and the French military organization has been framed in accordance with it.

To summarize, in this system the reserves play the most important part; as a consequence, the strength of the standing army may be reduced. From the standing army is to be recruited that of war time. To train, to mobilize and to cover the frontiers, are henceforward the main duties of the standing army.

Germany.—The general principles of German military law are similar to those of Great Britain and many European countries, and the United States system is somewhat similarly framed. There is no permanent president for courts-martial but, as in England, a presiding officer is chosen for each trial.

In different States of Germany different procedures hold for the formation of special summary courts-martial as occasions arise. There are no "Courts of Honour." The proceedings before a German court-martial are usually public except in the case of matters offending public morality, or in any other way compromising public order, and excepting also those cases where publicity is considered injurious to the interests of the forces as a whole. Such are cases of discipline, disclosure of military secrets, plans, etc. Military crimes and offences dealt with in the German Military Code of Penal Law of June 20, 1872 (within the meaning of the notification of Feb. 16, 1926) as acts punishable by law are mainly: (1) Extended unauthorized absence and running away from the flag; (2) self-mutilation; (3) cowardice; (4) serious wrongs against military subordination, as for instance threatening, insult and setting actually at work against superior officers—mutiny; (5) serious wrongs against inferiors, for example actual insult and ill treatment; (6) military theft (embezzlement), plundering; (7) bribery.

The Public Prosecutor acts normally as counsel for the accused. In Germany, however, procedure differs not only from district to district but according to the simplicity or severity of the case. There is no appeal, except for officials attached to the Army. Since the World War a series of changes has been introduced into the various systems in use in the different states and generalization concerning German procedure is now (1929), and will probably be for some years, unsafe. The general principles of courts-martial only have remained unchanged. (X.)

MILITARY RAILWAYS: *see* LIGHT RAILWAYS, MILITARY.

MILITARY SCIENCE, ARTICLES ON. The basic article is that on WAR, and complementary to this are the two important articles STRATEGY and TACTICS. Special forms of warfare are dealt with in the articles GUERRILLA WARFARE and MOUNTAIN WARFARE. The weapons and auxiliary means of warfare are covered in such articles as AMMUNITION; ARTILLERY; CHEMICAL WARFARE; BRIDGING, MILITARY; CAMOUFLAGE; CROSS-COUNTRY TRANSPORT; FORTIFICATION AND SIEGE-CRAFT; MOTOR TRANSPORT, MILITARY; ORDNANCE, etc.

For the structure, or organization, of armies the main article is ARMY. This is supplemented and enlarged by ARTILLERY; BARRACKS; CAVALRY; ENGINEERS; INFANTRY; INTELLIGENCE; MEDICAL SERVICE; SUPPLY AND TRANSPORT; STAFF; and by CONSCRIPTION; MILITIA; NATIONAL GUARD; TERRITORIAL ARMY; VOLUNTEERS and YEOMANRY.

Important aspects of war and armies are treated in the articles such as ARMY (MORALE IN WAR); COLOURS and UNIFORMS. The student of military antiquities will find much information in these, as well as in ENGINES OF WAR; GUARDS; GUN; HELMET; LANCE AND SWORD.

In military history, the chief wars of the ancient world are treated in such articles as GRAECO-PERSIAN WARS; PELOPONNESIAN WAR; PUNIC WARS, as also are the great military organizations, the MACEDONIAN ARMY; ROMAN ARMY and BYZANTINE ARMY. For the more important or famous battles of ancient history, see MARATHON; MANTINEIA; ISSUS; TRASIMEUS; CANNAE; METAURUS; ZAMA; ILERDA; PHARSALUS; ADRIANOPLE; DARAS; TAGINAE, etc. This evolutionary thread is maintained in dealing with the battles of mediaeval history, from TOURS, MANZIKERT and HASTINGS through DUPPLIN, CRECY, POITIERS and FORMIGNY, to RAVENNA and MARIGNANO, while special periods are examined in the MOHAMMEDAN CAMPAIGNS, MONGOL CAMPAIGNS, HUNDRED YEARS' WAR and ROSES, WARS OF THE.

In modern history each of the main wars has an article, *e.g.*, THIRTY YEARS' WAR, GREAT REBELLION, SPANISH SUCCESSION, SEVEN YEARS' WAR, FRENCH REVOLUTIONARY WARS, NAPOLEONIC CAMPAIGNS, PENINSULAR WAR, CRIMEAN WAR, AMERICAN CIVIL WAR, SEVEN WEEKS' WAR, FRANCO-GERMAN WAR, RUSSO-JAPANESE WAR. For the last war, as a whole, *see* the long and important article WORLD WAR, which is supplemented by other articles on each of the great battles or phases, *e.g.*, FRONTIERS, BATTLES OF THE; MARNE, FIRST BATTLE OF THE; MEUSE-ARGONNE, BATTLES OF THE; SOMME, BATTLES OF THE; VERDUN, BATTLES OF; YPRES, BATTLES OF 1914, 1915 and 1917; TANNENBERG, BATTLE OF; CAPORETTO; VITTORIO VENETO; ST. QUENTIN; LYS; CHEMIN-DES-DAMES; MARNE, SECOND BATTLE OF THE; AMIENS; ST. MIHIEL; HINDENBURG LINE; MEUSE-ARGONNE. The more distant theatres of war, such as PALESTINE, SALONIKA, MESOPOTAMIA and EAST AFRICA, are covered in special articles.

MILITIA, a term used generally for organized military forces which are not professional in character and not permanently embodied. (Fr. *milice*, Ger. *Miliz*, from Lat. *miles*, soldier, *militia*, military service.) All ancient armies, with the exception of the personal guards of their leaders, were militias or national levies, remaining under arms for the war or the campaign and returning to their ordinary occupations at the close of each military episode. Militias such as those of the Greek city-states and that of Rome were of course highly trained to the use of arms; so were the barbarian "nations in arms"; which overcame the professionalized Roman armies of the Empire; and although in the Eastern Empire these new fighting elements were absorbed into a fully organized regular arm, in the West the tribal militia system gradually developed into feudalism. The noble and the knight indeed spent the greater part of their lives in the field and devoted themselves from their youth to the cult of arms, but the feudal tenantry, who were bound to give forty days' war service and no more, and the burghers who, somewhat later in the history of civilization, formed the efficient garrisons of the walled towns were true militias. The English "Yeomanry" indeed almost ruled the battlefield.

In the 15th century the introduction of firearms began to weigh down the balance in favour of the professional soldier. Artillery was always the arm of the specialist. The development of infantry "fire-power," with the early arquebus and musket, called for the highest skill and steadiness in the individual soldier, and cavalry too adopted the new weapon in the form of long and expensive wheel-lock pistols. In the new military organization there was no place for the unprofessional soldier. The rôle of the unprofessional combatant, generally speaking, was that of an insurgent—harassing small detachments of the enemy, cutting off stragglers and plundering convoys. Towards the end of the first civil war in England (1645) the country-folk banded themselves together to impose a peace on the two warring armies, but their menace was without effect, and they were easily disarmed by Fairfax and Cromwell, who did not even trouble to hold them as prisoners. The calling out of the *arrière ban* of Franche-Comté in 1675 displayed its ludicrous inefficiency, and thereafter in France, which set the fashion for Europe in all military matters, the "provincial militia," which Louvois and Barbezieux raised in place of the discredited *arrière ban*, was employed partly to find drafts for and partly to augment the regular army.

When a first line army was large enough to absorb the fighting strength of the country there was neither room nor need for a true militia force. This was the case with France under Napoleon's régime, but things were different elsewhere. In Great Britain the county militia (whose special history is briefly sketched below) was permanently embodied during the greater part of the Napoleonic Wars. Destitute as it was of technical and administrative services, of higher staffs and organization, and even of cavalry,

this militia was a regular army in all but name. Combining continuous service with territorial recruiting as it did, it consisted of men of a better stamp than the casually recruited regular forces. In those days, the militia was a county force commanded by the lords-lieutenant and officered by men of influence; it was not administered by the War Office.

In other countries, Napoleon's invading armies had only to deal with regular or professional troops. Once these were crushed, nothing remained for the beaten side but to make peace with the conqueror on such terms as could be obtained. Militias existed in name as organizations, for the production of more or less unwilling drafts for the line, but the fundamental militia obligation of defending the *fatherland* as distinct from defending the *state*, produced only local and occasional outbursts of guerrilla warfare. In the Crimean War, the 1859 war in Italy, the 1866 war in Germany, and other wars (the Hungarian War of 1848–49 excepted) the forces, other than the regular troops, engaged in first line were guerrilleros, insurgents, Garibaldians, etc., and behind the forces in first line there were draft-supplying agencies, but no true militia. Only the British militia and the Prussian landwehr represented the self-contained army of second line, and of these the former was never put to the test, while the latter, responding feebly to a political call to arms in 1850, was in consequence so entirely reorganized that it formed a mere rear rank to the line troops. This latter system, consecrated by the German successes of 1870, became the universal model for the continent of Europe, and organized and self-contained militias to-day are only to be found in states maintaining first line armies of "general service" professionals, or in states which maintain no first line troops whatever. In the first class are the auxiliary forces of the British Empire and the United States, in the second the Swiss, Norwegian, Dutch and Swedish forces. On the other hand, with the reduction of the term of service in countries where conscription prevails to a term as short as twelve months, these armies are in nature if not in name tending to become a superior type of national militia.

MILITIA OF ENGLAND

The title of "militia" disappeared from the list of the British forces in 1908, on the conversion of the existing self-contained militia into an army "special reserve" which is restricted to the rôle of providing drafts for the first line.[1] The "self-contained" second line army of the present day is the Territorial Army (*q.v.*) (*see* also ARMY and GREAT BRITAIN: *Army*).

The county organization of England, with which throughout the militia was closely associated, began with the advent of the Saxons. The prototype of the militia was the Fyrd. In this force as reorganized by Alfred liability of service was general on the part of every able-bodied male between the ages of 16 and 60. Although the title of "The Fyrd" survived until long after the Norman conquest, the force established by King Alfred was known as the general levy, which was bound to appear armed when ordered to aid in suppressing domestic riots as well as in defending the realm against invasion by foreign foes. Service was restricted to the counties, except in case of invasion, when it was extended to the whole kingdom. The Norman Conquest was immediately followed by the introduction of the feudal levy in addition to the general levy, the distinction between these forces being that while obligation to serve in the latter rested upon every male within certain limits of age, service in the feudal levy depended upon tenure of land under the king as feudal lord. The general levy was not in any case liable for service overseas, but the king for a long time employed his feudal tenants in continental wars until they too, successfully resisted the demand. Personal service formed the basis of both levies, but service by deputy, or payment in lieu of personal service were allowed from very early times. The feudal levy was discontinued during the Commonwealth and abolished at the Restoration; but liability to serve in the general levy has never been extinguished, but remains in the statutory and practical form of liability to serve both in the general and local militia. Even at the abolition of these forces the statutory liability to service in them was not done away with. Inspections of arms and the assembly and training of the men raised under this national system were secured from time to time by means of "assizes of arms," "views of armour," "commissions of array," and "commissions of musters," dating from early in the 12th century down to the 16th century. These constitutional powers were frequently abused by "electing" or impressing men to serve out of the kingdom, but this was checked in the year 1327 by an Act of Parliament, which strictly regulated the scope and limits of military service within the kingdom at the charge of the parishes or counties, but provided for service abroad at the charge of the Crown. "Commissions of musters" were a development of preceding measures for raising men and material for military service, under which the commissioners registered and mustered persons liable to serve, sorted them into bands and trained and exercised them at the charge of the county. These bands became known as *train* or *trained bands*, and were mustered annually. With them were associated lieutenants of counties, first appointed in 1549 by Edward VI., subsequently in Queen Mary's reign called lords lieutenant, and after the Restoration appointed as statutory officers for the militia. There does not appear to have been any clearly defined regimental organization in existence until these bands or companies were called into active service, but the Acts of the Commonwealth supplied this defect, and initiated a permanent regimental system. One of the earliest attempts to reform the force since the time of King Alfred was made by Charles I. in 1629, when Orders in Council were issued instructing lords lieutenant to put the militia on a better footing. Cromwell subsequently issued similar orders couched in strong terms, though under the Commonwealth the duties of lords lieutenant were not recognized, the militia being raised by commissioners. The great services rendered by the militia in the "crowning mercy" of Worcester are a historic exception to the general decadence of second line troops in the 17th and 18th centuries (*see* GREAT REBELLION and WORCESTER, BATTLE OF, 1651). At the Restoration an act was passed declaring that the control of the militia was the prerogative of the king. By the same statute the militia of each county was placed under the lieutenant, who was vested with the appointment of officers, but with a reservation to the Crown in the way of commissioning and dismissal. The cost of the annual training—for fourteen days—fell upon the local authority. Offences against discipline were dealt with by the civil magistrates, but with a power to the officers of fining and of imprisoning in default. Upon this footing the militia of England remained for nearly a century, with the general approval of the community, as an instrument for defence and the preservation of internal order. While the supreme command was distinctly vested in the Crown, every practical security was thus taken against its use by the Crown for any object not constitutional or legitimate. It was regarded as, and was, in fact, the army of the state as distinguished from the standing army, which was very much the army of the king personally. But the new "professional" conditions of warfare, and perhaps the practice of trying military offences by civil courts, contributed to the disrepute into which the militia fell and the inefficiency it displayed, with the exception of the trained bands of London, until it was reorganized in 1757. Under the act of 1662 all train bands were discontinued in the counties, but those of London, with their auxiliaries, remained until 1794, when they were reorganized as the City of London Militia. In 1688 an act was passed raising the militia for one year, and for some time it was an annually sanctioned force as the regular army is to-day. In 1690, on the occasion of the threatened French invasion, the militia was embodied; and again in 1715 and 1745 during the troubles caused by the Old and Young Pretenders. In a pamphlet of 1712 the English militia was estimated at 7,450 horse and 84,391 foot soldiers.

MILITIA OF IRELAND AND SCOTLAND

Ireland and Scotland did not furnish any regular militia until 1715 and 1797 respectively, although in Scotland militia existed

[1]Various dominions and colonies of the British Empire have militias, for which *see* UNITED KINGDOM: *Army*. For the Swiss Militia System, which is in many respects the archetype of modern militias, *see* SWITZERLAND; and for the organized militia of the United States *see* UNITED STATES and NATIONAL GUARD.

long before 1797, *e.g.* in Perthshire in 1684; and in addition corps of fencibles were raised and embodied. The Irish militia when first raised in 1715 was restricted to Protestants between the ages of 16 and 60, who were bound to appear or provide substitutes. The force was not made subject to military law, but various military offences were punishable by fine or imprisonment. In 1793 a new act was passed providing for raising a force of militia by ballot among men between the ages of 18 and 45, to serve for four years. An amendment in 1797 abolished religious restrictions for the supplementary militia, and another in 1802 for the general militia. The Scottish militia was at first raised by ballot among men between the ages of 19 and 30. In 1802 former acts were replaced by an act providing for the organization of the militia on a basis similar to that on which the militia of England was organized by the Consolidation Act passed in that year.

CONDITIONS DOWN TO THE WORLD WAR

Reorganization of 1757.—To return to England, the immediate cause of the organic reform carried out in 1757 was the disclosure of the inefficiency of the militia during the Rebellion of 1745. A liability on the part of the county or parish was now substituted for a liability on the part of individual property-owners. Each county was required to furnish a quota apportioned among the various parishes; men were to be chosen by lot to serve for three years (this being the first provision of a fixed term of service) or to provide, or pay £10 for the provision of, a substitute, and the ages of liability were from 18 to 45. The force was to be annually trained and exercised for a limited period, and in case of invasion or danger thereof, or in case of rebellion, the Crown could order it or any portion of it to be embodied; but only on condition of informing parliament (which was if not sitting to be summoned for the purpose). During the embodiment or annual training it was subject to the Mutiny Act, except that no punishment during training was to extend to "life or limb," to prevent an unconstitutional use of the militia by the Crown, the estimate for its training was framed each year, not by an executive minister of the sovereign, but by the House of Commons itself. Upon the initiative of a committee of the House, an act was passed providing for the pay and clothing of the militia for the year. The king directly appointed the permanent staff and was given a veto on the appointment and promotion of the officers, who were to have a property qualification.

Under this act 30,000 militiamen were raised by ballot and embodied from 1759 to 1763. This force was exclusively "Protestant," and remained so until 1802. The service of the militia as thus arranged remained nearly in the same state until 1870. Pitt's reform, however, was followed by numerous amendments, new enactments, and other changes, of which the most important are summarized below:—

1796. Supplementary militia formed, consisting of 63,878 men.
1798. (Irish Rebellion.) English militia volunteered for service in Ireland.
1799. Irish militia volunteered to serve in Great Britain.
15,000 militiamen volunteered to regular army.
1805. Militia affiliated to line for purposes of recruiting for regulars.
1806. Training Act to raise by ballot 200,000 men to be trained for one whole year, and then to discharge them from training for two years.
1808. Difficulties having arisen under above Act, local militia (which is in effect the old general levy) established in addition to general militia then embodied.
1811. English militia now made liable to serve in any part of the United Kingdom under certain restrictions, which were subsequently (in 1859) removed.
1812. In this year there were 250 regiments of local militia, with an establishment of 240,388 men and 214,418 actually enrolled.
1813. During ten years, from 1803 to 1813, nearly 100,000 militiamen joined the regular army.
Act passed to enable militia to serve abroad as militia with their own officers. Three strong battalions joined the British army in France.
1816. Local militia and Ballot Act suspended.
General militia disembodied.
1820–21–25. Militia called out for training.
1831. Militiamen raised by ballot in accordance with Order in Council, 27th of December 1830. This was the last occasion on which the ballot was put in force.

In the later stages of the great French war the tendency of the government was to use the general militia rather as a reservoir producing drafts (in the end whole units) for service abroad, and the local militia as the real defensive force. After the peace of 1815 the militia was allowed practically to fall into abeyance, and although the permanent staff was maintained, it had no duties to perform. It was not until 1852, after an unsuccessful attempt to resuscitate the local militia, that the general militia of England was reorganized under a system of voluntary enlistment with the ballot in reserve, Scotland and Ireland being included in 1854. Larger powers respecting the militia were conferred upon the Crown, and during the Crimean War the queen was authorized to embody the militia whenever a state of war existed with any foreign power. In that war the militia was embodied and did garrison duty not only in the United Kingdom but in the Mediterranean garrisons, thus enabling the authorities to send most of the available regular troops to the scene of hostilities. It further contributed many officers and some 30,000 men to the line. During the Indian Mutiny it filled scarcely less useful functions when again called out.

In 1871 an important constitutional change was made. It was part of the new army system inaugurated in that year that the control of the militia should be removed from the lord-lieutenant of the county and vested wholly in the Crown. It now virtually ceased to exist as a distinct body, and in 1881 it became a part of the regular forces with a limitation as to the time and area and other conditions of service. Militia battalions were united with the line battalions to form "territorial" regiments. The officers, who were commissioned by the Crown, were in 1877 made subject at all times to military law. Non-commissioned officers and men were only so subject when embodied or out for training. The period of engagement was for six years, re-engagements for periods of four years up to the age of 45 being permitted. Bounties were paid to militiamen at various rates upon enlistment, conclusion of training, re-engagement, enlistment into reserve or special service section, and other special circumstances. The annual training varied with the different branches of the service. The usual term for infantry was 27 days, 56 days being the legal maximum. The militia dépôts occupied as a rule the same barracks, and officers and men wore (with slight distinctions) the same uniform as the regulars.

The militia reserve consisted of men selected from the ranks of the militia for special enlistment for service in the regular army when called upon in emergencies, in the following proportions to the establishments of the various corps: Artillery, one-third; engineers and infantry, one-fourth; medical staff corps, one-half. The term "militia" reserve was therefore a complete misnomer, and the force so called was purely an army reserve. The special service section of the militia was formed by royal warrant in 1898, and consisted of (1) militia units and (2) individual militiamen. A militia unit was considered as available for special service if not less than 75% of the officers and men present at training made a voluntary offer to engage for special service in any part of the world. Liability for service was limited to 12 months. The result of this special section was not up to 1900 satisfactory.

During and after the South African War, while militia recruiting for the regulars showed a constant increase compared with preceding years, the strength of the militia itself decreased year after year. Its militia character had been diminishing ever since the creation of the "militia reserve" and the close affiliation of the force to the regular army. For good or evil, then, it had become in the first place a draft-producing agency, and on the reorganization of the forces of the Crown into two lines by Mr. Haldane the old "constitutional force" was frankly reorganized as a reserve for the line, enlistment and training conditions remaining somewhat similar to those in vogue in the militia, but the liability for service abroad becoming the first and most important condition in the "special reservist's" enlistment.

THE SPECIAL RESERVE

Test of the War.—The new Special Reserve was soon to be tested highly. For the World War had hardly begun in 1914 before the casualties and the consequent demand for drafts immeasurably

exceeded all calculations. While the Territorial Force and the New Armies were maintained from their own reserve sources of man-power, the requirements of the regular army were such that in the later stages of the war many of its battalions were officered entirely by officers trained in the Special Reserve. Some 67,307 officers and 1,763,253 other ranks were sent overseas as drafts to the infantry alone. The Special Reserve performed a threefold task, for besides supplying drafts it was relieving the Territorial Force of the duty of guarding the coast and provided part of the nucleus of trained soldiers on whom the New Armies were built. In addition, six infantry battalions and thirteen R.E. companies were sent out as units.

After the war, as a concession to feeling, the time-honoured title of "The Militia" was revived, and the War Office took the step of allotting one battalion to each regular regiment and invited county authorities to recommend officers for command. But the retrenchment of expenditure caused the postponement of any action, and the militia remains a mere title in the Army List, with a few officers nominally on its strength and the solemn annual announcement that "no militia training will be carried out this year." The increasing mechanization of the army is, however, tending to reduce the need for and the suitability of such a force, and its place has to some extent been taken by the formation of a Supplementary Reserve consisting mainly of technical personnel.

(B. H. L. H.)

UNITED STATES

The militia of the United States of America consists of all able-bodied male citizens (including those who have indicated their intention to become citizens) of more than 18 and, except as provided by law, of not more than 45 years of age. It comprises the National Guard, the Naval Militia and the Unorganized Militia. The National Guard consists of regularly enlisted militia between the ages of 18 and 45, and commissioned officers between the ages of 21 and 64 years. The National Guard developed from the militia, and is the largest and best prepared component of the military establishment. It is to be used as a front line force in time of emergency.

In 1774 the Massachusetts Colonial Assembly appointed a Committee of Safety which organized the militia in the locality of Boston. The Second Continental Congress (1775) provided for the organization of the militia of the several colonies, part of which agreed to hold themselves in readiness at a minute's notice, thereby becoming the so-called "Minute Men." Shortly after the battle of Lexington, the Congress of Massachusetts resolved that 50,000 troops were necessary and advised the several colonies to raise their proportion of this force, 13,600 being the quota to be raised in Massachusetts.

The Continental Congress, in so far as organization and administration of the militia was concerned, was almost entirely advisory. Enlistments were for approximately three months and desertions were extremely numerous. Of the 395,864 troops enrolled during the Revolutionary War, 164,087 were militia. Troops were untrained, and the officers inexperienced.

The first Federal Militia Law was enacted in 1792 and provided for the enrollment for military duty of able-bodied, white, male citizens between 18 and 45 years of age. No compensation was offered but each militiaman was expected to provide himself with a good musket. No active Federal control was contemplated and no Federal financial aid provided before 1808. For over 100 years after the Revolution, there was practically no development of the militia. There was no co-operation between the regular army and State troops until about 1880. In 1880, $200,000 was voted by Congress for the militia. This continued until 1887 when it was increased to $400,000 yearly. From 1900 to 1906, $1,000,000 was voted, and at present appropriations are about $31,000,000.

In the Spanish War, the militia consisted of about 1,600 companies informally grouped, in some instances, into battalions, regiments and brigades.

The origin of the present National Guard dates from the Dick Bill of 1903, whereby the militia was officially designated the "Organized Militia of the United States." The bill provided for: organization, armament and discipline to be the same as in the regular army; it authorized the secretary of war to issue at Federal expense ammunition and supplies provided for the regular army; it provided for regular inspections by regular army officers and regular returns by State adjutants general; it provided for participation of the militia in joint manoeuvres with the regular army and for pay, subsistence and transportation during such activities. State encampments for training were provided for, regular army officers were sent to the States as instructors, and other important improvements in organization were provided. The Division of Military Affairs in the War Department, with a regular army officer as chief, was inaugurated. The divisional plan of organization was adopted in 1913 and further Federal aid and co-operation were embodied in the National Defence Act of June 3, 1916.

On Aug. 5, 1917, all of the National Guard to which Federal recognition had been extended became part of the army of the United States. These troops consisted of 12,115 officers and 336,954 enlisted men and were organized into 16 divisions which were sent to various camps throughout the country for further training and development for use during the World War.

Reorganization of 1920.—By the Act of June 4, 1920, the National Guard was reorganized, and provision made for the preservation of names, records and flags of former National Guard organizations that had served in the World War, and for the establishment of the Militia Bureau of the War Department. This law further provided for enlistment under Federal oath, defined the pay, provided for equipment and training, and for the employment of the National Guard by draft into the service of the United States in national emergencies.

The authorized strength of the National Guard was fixed at 200 enlisted men for each senator and representative in Congress and a number to be determined by the president for each territory and the District of Columbia, this number to be increased each year after 1920 in the proportion of not less than 50% until the total peace strength of not less than 800 enlisted men for each senator and representative in Congress should have been reached. This now provides for a force of about 435,800.

In 1922 the National Guard was to be limited to 250,000, but current appropriations are sufficient for the maintenance of only 186,000, which comprise 18 infantry divisions, four cavalry divisions, certain coast defence corps and army troops, G.H.Q. and auxiliary units. In general, two divisions of infantry have been allocated to each of the nine corps areas of the United States. The enlisted personnel is obtained by recruiting agencies under State control. Original enlistments are for three years, subsequent enlistments being for one year.

The National Guard when not in Federal service is under command of the governor of each State. While not in the service of the United States, it is governed by National Guard regulations issued by the War Department in forms similar to army regulations. The Militia Bureau, under the direction of the secretary of war, is charged with the general administration of National Guard affairs. It is inspected by regular army officers to determine Federal recognition and consequent Federal financial aid. Annual armoury and field inspections are required. State funds amounting to about $11,000,000 provide for the State administration of the National Guard and supplement the pay of officers and men which is provided by the Federal Government. In general, the United States appropriates about $3.00 where the States appropriate about $1.00. The cost of each enlisted man in the National Guard is approximately $230.00 a year.

Officers and men in the National Guard receive one day's pay on a regular army basis for each drill period attended by 50% of the enlisted and 60% of the officer personnel and for each day of practical training in camp. Officers of the National Guard are eligible for detail as students at the general and special service schools of the army.

National Guard troops may be employed (1) as State troops under State control; (2) by the Federal Government under call into the Government service under constitutional provisions to execute the laws of the Union, suppress insurrection and repel invasion; (3) by draft into the Federal service as part of the

army of the United States. A "call" into the service of the United States is issued by the president in certain specifically defined emergencies. It may be issued when troops are required for some specific purpose, or it may be a warning order preliminary to a procedure known as a "draft." A "draft" is a procedure adopted by the president to take into the military service of the nation as a component of the army for service during the war or in an emergency a part or all of the National Guard when Congress shall specifically authorize for any particular emergency the use of armed land forces in excess of the regular army. As a result of this act (draft), the National Guard is divested of its militia character and becomes a Federal force without allegiance to State authorities. (W. N. Ha.)

MILK is the secretion of the mammary glands (mammae) of the large class, the Mammalia, of vertebrate animals that suckle their young. Those animals the milk of which is commonly consumed by man are the cow, the goat and the sheep.

The average composition of milk, according to Richmond is shown in the following table.

Water	87·34
Fat (Milk fat or butter fat)	3·75
Lactose	4·70
Caseinogen	3·00
Lactalbumin	0·40
Salts	0·75
Other Constituents	0·06

While the lactose and mineral salts are in true solution (*see* SOLUTIONS) the proteins, caseinogen and lactalbumin, are present in colloidal solution, with which fat is intimately mixed in the form of an emulsion or suspension of globules.

Milk is a complete food, containing as it does protein, fat, carbohydrates, mineral constituents, and water. Though deficient or lacking in certain metallic elements believed essential for normal adult health, the milk of any species is an adequate diet for the very young of that species in all respects, including its contents of vitamines (*q.v.*). On the other hand, it may not be equally satisfactory for the young of another species. Thus cow's milk is not always an absolute source of vitamine C for human infants. Normally cow's milk if produced under proper conditions is an adequate source of vitamines A and B, and a reasonably good source of C and D. Its content of vitamine E is probably low.

Variation in Composition.—The specific effects of different circumstances on the yield and chemical composition of milk are frequently dealt with in the reports on the experimental work carried out by the various agricultural colleges. According to Mackintosh the naturally occurring conditions which influence the yield and quality of milk can be summarized as follows:—1. Breed of Cow. 2. Individuality of Cow. 3. Period of Lactation. 4. Interval between milkings. 5. Efficiency of the milker. 6. Age of the Cow. 7. Climate and weather conditions. 8. Health of the Cow. 9. Kind and quality of food.

Under the Food and Drugs Act milk (other than skimmed, separated or condensed milk) must contain not less than 3 per cent. of milk fat and 8·5 per cent. "solids not fat," until the contrary is proved. Skimmed or separated milk should contain not less than 8·7 per cent. total solids.

The addition of preservatives or of colouring matter is illegal.

THE BRITISH MILK TRADE

Owing to its nature, fluid milk is one of the few products which are practically free from foreign competition. Approximately 80% of the dairy farms in England and Wales are producing milk for sale in the liquid state, which necessitates good market organization, as milk is the most perishable, bulky and easily contaminated of all food stuffs. Such organization depends largely upon centres of consumption by reason of the high cost of transport and necessary speed of delivery.

After the low prices of 1922 the National Farmers' Union and the National Federation of Dairymen combined to form a committee, which now regulates the price, and this price at first only applicable to London now influences the whole country.

After some opposition the majority of milk distributors agreed to purchase all their supplies through the pool. The Agency already embraces over 1,200 individual farmers, 14 Farmer's co-operative creameries, and handles over 50,000 gallons of milk per day, or 70% of all the milk supplies of the Clyde valley.

Recently the Scottish Milk Pool has extended its activities to Edinburgh and Aberdeen. Little changes have been caused by the inception of the pool in the methods of distribution, but gradual economies will be introduced, so as to lower transport and distribution costs.

Milk Classification.—Various "clean milk" movements have resulted, in England, in an optional system of grading milk with a sufficiently high degree of bacterial purity. The following standards are laid down under licence granted by or under the authority of the Ministry of Health:—

Raw Milk

<table>
<tr><th rowspan="2">Designation</th><th rowspan="2">Herds</th><th colspan="2">Bacterial content</th><th rowspan="2">Other conditions</th></tr>
<tr><th>Maximum number of bacilli per cubic centimetre</th><th>Coliform bacillus</th></tr>
<tr><td>Certified</td><td>Tuberculin tested and physically examined at regular intervals</td><td>30,000</td><td>Absent in $\frac{1}{10}$ cubic centimetre</td><td>Bottled on the farm, name of farm, day of production and word "Certified" on each bottle cap</td></tr>
<tr><td>Grade A Tuberculin tested</td><td>Tuberculin tested and physically examined at regular intervals</td><td rowspan="2">200,000</td><td rowspan="2">Absent in $\frac{1}{100}$ cubic centimetre</td><td rowspan="2">See Note*</td></tr>
<tr><td>Grade A</td><td>Physically examined at regular intervals</td></tr>
</table>

*Delivered to consumers in (a) the bottles or the sealed containers as received from the farm; (b) suitable containers of not less than two gallons capacity; (c) bottles with the name of the dealer by whom the milk was bottled, the address of the licensed bottling establishment, the day of production and the words "Grade A Tuberculin Tested" or "Grade A" on each bottle cap.

Pasteurized Milk

Designation	
Grade A pasteurized	Grade A milk that after pasteurization, as required by the Minister of Health, contains not more than 30,000 bacilli per cubic centimetre and no coliform bacillus in $\frac{1}{10}$ cc. All other conditions as required for Grade A milk
Pasteurized	Any milk that after pasteurization, as required by the Minister of Health, contains not more than 100,000 bacilli per cubic centimetre. No requirement for bottling

The regulations for the production of graded milks in Scotland is similar to the above, except that the milk must contain not less than 3·5 per cent of butter fat.

CONSUMPTION OF MILK

Statistics indicate that of the 1,117 million gallons of milk produced (exclusive of that fed to calves, etc.), 888 millions were consumed in the liquid state. This figure ignores the surplus which would be used for manufacturing. On this basis it has been estimated that the consumption per person in England and Wales is approximately 0·44 pts. per day.

For comparison, the consumption of milk per capita per day in the following countries is given:—Switzerland 1·83 pints, Sweden 1·48 pints, U.S.A., 1·00 pints, France 0·33 pints, and Berlin 0·30 pints.

Milk Products.—Butter and cheese production is largely confined to the West of England. (*See* DAIRY FARMING.) Large quantities are imported, butter from Denmark, New Zealand, and Australia. New Zealand and Canada are the chief countries from which cheese supplies are drawn. Cream for sale finds a limited market, and recent legislation entirely prohibits the addition of preservatives to cream.

Ice Cream.—Accurate figures on the manufacture of ice cream are difficult to obtain. The consumption is steadily increasing and the sales in 1923 were quite 5 times greater than those in 1919.

Good ice cream is very nutritious and easily digested. Unlike the United States and Canada, England has no definite legal standard as to composition.

The constituents used are many including fresh milk, condensed or dried milk, butter, cream, eggs, sugar, flavouring chocolate, nuts and fruit, with gelatine, corn-flour and rennet as stabilisers.

The process through which the mix, or unfrozen ice cream, passes are as follows:—Weighing and mixing of ingredients, pasteurising, homogenizing, and standardising to smooth the mixture and form a perfect emulsion, cooling, ageing for 12–72 hours to improve the flavour and then finally freezing and hardening.

Condensed and Dried Milk.—Condensed milk is cow's milk, skimmed or full cream from which a large proportion of water has been evaporated. The varieties known to the trade are sweetened condensed milk, to which cane sugar has been added, unsweetened condensed or evaporated milk, bulk condensed milk, and concentrated milk, such designations referring to the degree of concentration. Unsweetened varieties are sterilized during the manufacturing process. In this country the composition, and concentration is limited by the Condensed Milk Regulations (1923), which require that all condensed milk imported or sold for human consumption be contained in a tin or receptacle labelled as prescribed in the regulations. All condensed milk shall contain not less than:—

	Milk fat %	Milk solids (including fat) %
1. Full cream (unsweetened)	9·0	31·0
2. Full cream (sweetened)	9·0	31·0
3. Skimmed (unsweetened)	..	20·0
4. Skimmed (sweetened)	..	26·0

England is the principal market for condensed milk, but considerable quantities are re-exported. The Netherlands, Denmark, and the United States are the chief sources of supply, to a lesser extent Switzerland and Canada. A small amount is manufactured in this country.

Cow's milk, whole, or with part, or all of the cream removed, and evaporated to dryness, is variously named dry milk, desiccated milk, dehydrated milk, pulverized milk, milk powder, powdered milk, or milk flour. Sometimes it contains sucrose, and sometimes alkali or a buffer salt is added to render the product easily soluble. Powdered milk is well dried. Troubles due to bacteria and enzyme action are seldom met with, but deterioration due to oxidation of the milk fat may take place. For this reason milk powder from skimmed milk is most extensively manufactured.

The Public Health (Dried Milk) Regulations 1923 prescribe for the labelling and description of dried milk and milk powder. There are four classes of dried milk (1) dried full cream milk; (2) dried three-quarter cream milk; (3) dried half-cream milk; and (4) dried quarter-cream milk. Such milk shall contain not less than the following percentage of milk fat and milk solids:—

	Milk fat %	Milk solids (including fat) %
Milk	3·6	12·4
Three-quarter-cream milk	2·7	11·6
Half-cream milk	1·8	10·8
Quarter-cream milk	0·9	9·9

New Zealand is the chief source of supplies, but considerable quantities are obtained from the Netherlands, Canada, Australia, and the United States.

Dried Casein.—Casein is prepared for food, and industrial purposes. The usual method is by curdling separated milk, either by rennet or by acid; the precipitated casein is then washed and dried. Two distinct types are produced, one for food and medicinal purposes, the other for use in the manufacture of paints, putties, plastic masses, artificial ivory, for waterproofing manufacture, and as a dressing for paper and cloth.

The imports of Casein into Great Britain are largely from New Zealand, France, and Argentina. Considerable progress in the manufacture and export of casein has taken place in New Zealand during the last few years. (O. J. R.; A. Hy.)

UNITED STATES

The total annual production of milk in the United States has increased steadily for a number of years. This is due more to increased production per cow than to increase in number of cows. The number of milch cows on farms, 1920–28, as estimated on Jan. 1 of each year by the U.S. Department of Agriculture and including all milch cows and heifers two years old and over, follows:—

Year	Number	Year	Number
1920	21,427,000	1925	22,481,000
1921	21,408,000	1926	22,188,000
1922	21,788,000	1927	21,818,000
1923	22,063,000	1928	21,948,000
1924	22,255,000		

The increase in number of cows on farms from 1920 to 1928 was 6·41%. On Jan. 1, 1928, there were 185 milch cows on farms per 1,000 population, as against 201 in 1920. Estimates by the U.S. Department of Agriculture of milk production since 1920 indicate the progress of the dairy industry:—

Year	Production of milk in pounds	Year	Production of milk in pounds
1920	89,657,000,000	1924	114,666,000,000
1921	98,862,000,000	1925	116,505,000,000
1922	102,562,000,000	1926	120,766,000,000
1923	109,736,000,000		

Utilization of Milk.—The following table gives the quantities and proportions of milk in the United States used in each product for the calendar year 1926:—

Production and Uses of Milk in the United States

	Milk used per unit of product	Quantity of product manufactured	Whole milk used	Per cent of total milk
	lb.	lb.	lb.	
Creamery butter	21	1,451,766,000	30,487,086,000	25·245
Farm butter	21	615,000,000	12,915,000,000	10·694
Cheese (all kinds)	10	427,416,000	4,274,160,000	3·539
Condensed and evaporated milk	2·5	1,733,504,000	4,333,760,000	3·589
Powdered milk	8	10,768,000	86,144,000	·071
Powdered cream	19	331,000	6,289,000	·005
Malted milk	2·2	20,673,000	45,481,000	·038
Sterilized milk (canned)	1	1,286,000	1,286,000	·001
Milk chocolate	..	..	171,543,000	·142
Ice cream	13·75*	324,665,000†	4,464,144,000	3·698
Total whole milk used in manufacturing	..	..	56,784,893,000	47·020
Milk: For household purposes	..	55·3 gal. per caput	56,417,000,000	46·716
Fed to calves	..	200 lb. per calf	3,941,600,000	3·264
Wasted (estimated)	..	..	3,622,994,000	3·000
Grand total	..	..	120,766,487,000	100·000

*Per gallon. †Gallons.

The per caput consumption of milk, butter, cheese, condensed and evaporated milk and ice cream in the United States since 1917 shows remarkable increases.

Year	Milk	Butter	Cheese	Condensed and evaporated milk	Ice cream
	gal.	lb.	lb.	lb.	gal.
1917	42·4	14·6	2·89	10·49	2·07
1918	43·0	14·0	3·00	12·50	2·14
1919	43·0	14·8	3·50	12·30	2·49
1920	43·0	14·7	3·50	10·17	2·46
1921	49·0	16·1	3·50	11·40	2·28
1922	50·0	16·5	3·70	12·69	2·43
1923	53·0	17·0	3·90	13·25	2·68
1924	54·75	17·38	4·20	14·00	2·50
1925	54·75	17·39	4·26	14·87	2·80
1926	55·30	17·82	4·36	14·32	2·77

City Milk Supply.—The smaller American cities, having populations from a few hundred to 5,000, are usually supplied entirely by farmers who live near the cities, and by people who live in the suburbs and own one or more cows. Cities with a population of 5,000 to 10,000 are supplied by farmers from near the cities and also by milk distributors who purchase milk from more distant farmers and distribute it throughout the city. The larger cities receive their milk supply by train or truck from the country districts, sometimes from a distance of 200 or more miles. The supply of cream may be furnished in part by dairy districts 500 to 1,000 m. distant. The farmers who supply milk for such large cities as New York and Chicago, receive a price based on the butter-fat content of the milk less a charge for transportation according to the zone from which it is shipped. The zones are 10 m. in width and shippers in the same zone pay the same transportation costs per 100 lb. of milk. Milk receiving and cooling stations are located along the railroads, to which the milk is delivered direct by the farmers or "milk haulers" who collect from the farmers. Milk is hauled by passenger trains or by special trains which take precedence on the railroad over most of the other traffic. When the milk arrives at the dêpots it is speedily taken to the plants of the milk distributors, pasteurized, cooled and bottled ready for the milk wagons or trucks to deliver it to the consumers the following day.

Trend of Milk Prices.—The trend of the price of market milk has been upward for the last 30 years. This increase in price is, of course, due in part to a rise in the general price level of all commodities. The yearly average wholesale price of market milk per 100 lb. in Chicago, Ill., in 1900 was $1.35; in 1910, $1.83; in 1928, $2.49, an increase of 84·4% from 1900 to 1928. The retail price of milk for household use varies with the region and also with the season. The winter price is higher than the summer price on account of the additional cost of feed and as an inducement to producers to increase the supply and thus prevent a shortage.

Co-operative bargaining associations of producers have been able to increase the producer's price somewhat, but in many cities the retail price is more than double the buying price at country stations. When the price paid the producers is from 6 to 9 cents per quart, the retail price per quart delivered to consumers in large cities is usually from 12 to 20 cents.

The prices paid milk producers who are members of co-operative-selling organizations, are generally established monthly at a meeting of their committee, which meets with the dealers to discuss the market conditions. The price of 92 score butter and the value of milk for manufacture of cheese are considered with other factors in establishing the fluid milk price. Although the principal business of co-operative butter and cheese associations is to market butter and cheese, some of them are in a position to ship sweet cream or milk to the city market whenever it is advantageous to do so. Frequently cheese factories are under contract to furnish milk distributors in cities with milk when it is needed. Some co-operative creameries, where the cream is of good quality, ship many cars of sweet cream to large cities for use as fluid cream. One co-operative creamery association, during 1927, shipped 417 cars of sweet cream from the Middle West to Eastern cities. A recent development in the distribution of market milk and cream consists of the chain stores which retail milk and cream, generally at a slightly lower price than is asked for the milk delivered at the door of the patrons. Chain stores also have become an important factor in the retail distribution of butter and cheese, often buying direct from the manufacturers and selling direct to the consumer with a very small margin of profit. (*See* also FOOD PRESERVATION.) (T. R. PI.)

MILKING MACHINE: *see* DAIRY MACHINERY.

MILK-TREE, the name applied to two South American trees. In Brazil this is *Mimusops elata,* which produces a latex that "exudes in abundance when the bark is cut; it has about the consistence of thick cream" (A. R. Wallace, *Travels on the Amazon and Rio Negro*), and is used as milk and as glue. The timber of this tree is valuable and the fruit is edible. It belongs to the sapodilla family (Sapotaceae). The milk-tree of Venezuela is *Brosimum Galactodendron,* a member of the mulberry family (*Moraceae*). (*See* COW-TREE.)

MILKWEED, the name given to plants of the botanical genus *Asclepias,* family Asclepiadaceae (*q.v.*), comprising about 85 species, natives mostly of the New World, some 45 of which are found in North America. All are characterized by having a milky juice, and silky-downy seeds. Well known species of the eastern United States and Canada are the common milkweed (*A. syriaca*), the swamp milkweed (*A. incarnata*) and the poke milkweed (*A. exaltata*). Noteworthy species of the western United States are the showy milkweed (*A. speciosa*) and the narrow-leaved milkweed (*A. mexicana*). *See* BUTTERFLY-WEED.

MILKWORT, in botany, the common name for plants of the genus *Polygala* (family Polygalaceae), a large genus of some 500 species, widely dispersed in temperate and tropical regions and represented by about 50 species in North America and a few species in Great Britain. The common species, *P. vulgaris,* is a small wiry perennial found on heaths and in meadows throughout the British Isles. The stems are 2 to 10 in. long and bear narrow rather tough leaves and small, $\frac{1}{6}$ to $\frac{1}{3}$ in. long, white, pink, blue, lilac or purple flowers. The flowers are peculiar in form and arrangement of parts; they have five free sepals the two inner of which (*b*) are large petaloid and winglike, forming the most conspicuous part of the flower; the petals are united below with the sheath of the eight stamens forming a tube split at the base behind; their form recalls that of the pea family. The name *Polygala* is from the Greek πολύς, much, and γάλα, milk, the plant being supposed to increase the yield of milk in cows. Some species with showy flowers are known in cultivation as greenhouse or hardy annual or perennial, herbs or shrubs. The root of *P. Senega,* snake-root, a North American species is officinal. The fringed milk wort or flowering wintergreen (*P. paucifolia*), of the north-eastern United States and adjacent Canada, is a delicate woodland plant with handsome purple flowers. Sea milkwort is the common name for *Glaux maritima,* a small succulent herb found on northern ocean shores, and occurring on the Atlantic and Pacific coasts and locally in the interior of North America and also in the British Isles; it belongs to the primrose family (Primulaceae).

MILKWORT (POLYGALA VULGARIS)
The flowers have two coloured sepals, which are red, white or blue like the flowers

MILKY WAY: *see* GALAXY AND STAR.

MILL, HUGH ROBERT (1861–), British geographer and meteorologist, was born at Thurso on May 28, 1861, and was educated at Edinburgh university In 1884 he was appointed chemist and physicist to the Scottish marine station. In 1892 he became librarian to the Royal Geographical Society, and was honorable secretary of the Royal Meteorological Society from 1902–06, becoming its president in 1907. He served on many committees connected with meteorology and allied subjects, including the International Council for the study of the sea (1901–09), and the board of trade committee on the water power of the British Isles (1918). In 1901 he became director of the British Rainfall Organization, and editor of the *British Rainfall* and *Symons's Meteorological Magazine,* and when the organization was converted into a trust he became chairman of trustees (1909–19). From 1906–19 he was rainfall expert to the Metropolitan Water Board. In 1927 he became president of the Royal Geographical Society.

His publications include: *The Realm of Nature* (1892, latest ed. 1913); *The English Lakes* (1895); *Hints on the Choice of Geographical Books* (1897); *New Lands* (1900); *The Siege of the South Pole* (1905); a historical introduction to Sir Ernest Shackleton's *Heart of the Antarctic* (1909); *The Life of Sir Ernest Shackleton* (1923); he also edited *International Geography* (1911).

MILL, JAMES (1773–1836), historian and philosopher, was born on April 6, 1773, at Northwater Bridge, in the parish of Logie-Pert, Forfarshire, the son of James Mill, a shoemaker. His mother, Isabel Fenton, of a good family which had suffered from connection with the Stuart rising of 1745, sent him first to the parish school and to the Montrose academy, and then to the university of Edinburgh, where he distinguished himself as a Greek scholar. In October 1798 he was licensed as a preacher, but occupied himself with occasional teaching and with historical and philosophical studies. In 1802 he went to London in company with Sir John Stuart, then M.P. for Kincardineshire, and devoted himself to journalism. In 1804 he wrote a pamphlet on the corn trade, arguing against a bounty on the exportation of grain. After his marriage (1805) with Harriet Burrow, he took a house in Pentonville, where his eldest son, John Stuart Mill (*q.v.*), was born in 1806. About the end of this year he began his *History of India,* which he took 12 years to complete, instead of three or four, as he had expected.

In 1808 he became acquainted with Jeremy Bentham, and was for many years his chief companion and ally. He adopted Bentham's principles in their entirety, and did more to propagate them and to oppose the beginnings of Romanticism than anyone else. He was a regular contributor (1806–18) to the *Anti-Jacobin Review,* the *British Review,* the *Electric Review,* and the *Edinburgh Review* (1808–13). In 1811 he co-operated with William Allen (1770–1843), quaker and chemist, in a periodical called the *Philanthropist.* He contributed largely to every number—his principal topics being Education, Freedom of the Press, and Prison Discipline (under which he expounded Bentham's "Panopticon"). He took part in the discussions which led to the foundation of London university in 1825. In 1814 he wrote various articles, containing an exposition of utilitarianism, for the supplement to the fifth edition of the *Encyclopædia Britannica.*

In 1818 the *History of India* was published, and, in spite of the fact that it contained drastic criticisms of British rule in India, Mill was appointed an official in the India House. He gradually rose till he was appointed, in 1830, head of the office. His *Elements of Political Economy* appeared in 1821 (3rd and revised ed. 1826).

From 1824 to 1826 Mill contributed to the *Westminster Review,* started as the organ of his party, articles attacking the *Edinburgh* and *Quarterly Reviews* and ecclesiastical establishments. In 1829 appeared the *Analysis of the Human Mind.* From 1831 to 1833 Mill was largely occupied, as the spokesman of the court of directors, in the defence of the East India Company, during the controversy attending the renewal of its charter. His last published book was the *Fragment on Mackintosh* (1835). He died June 23, 1836.

Mill's greatest literary monument is the *History of India.* The materials for the history of the conquest of India were put into shape for the first time; political theory was brought to bear on the delineation of the Hindu civilization, and the conduct of the actors in the successive stages of the conquest and administration of India was subjected to a severe criticism. The work itself, and the author's official connection with India for the last 17 years of his life, effected a complete change in the whole system of governing that country.

Mill played a great part in English politics, and was, more than any other man, the founder of what was called "philosophic radicalism." His writings on government and his personal influence among the Liberal politicians of his time determined the change of view from the French Revolution theories of the rights of man and the absolute equality of men to the claiming of securities for good government through a wide extension of the franchise. Under this banner it was that the Reform Bill was fought and won. His *Elements of Political Economy,* which was intended only as a textbook of the subject, shows all the author's precision and lucidity. Its interest is mainly historical, as an accurate summary of the views of the philosophic radicals, based mainly on Ricardo. Mill maintained: (1) that the chief problem of practical reformers is to limit the increase of population, on the assumption that capital does not naturally increase at the same rate as population (ii. § 2, art. 3); (2) that the value of a thing depends entirely on the quantity of labour put into it; and (3) that what is now known as the "unearned increment" of land is a proper object for taxation. The clear enunciation of the second of these propositions is important in view of the emphasis laid on it by Marx and his followers and the deductions they made from it.

In his *Analysis of the Mind* Mill developed the psychological side of the Benthamite philosophy. It was a more systematic attempt than that already made by Hartley to explain all mental phenomena by the association of ideas. "Not only does he explain all phenomena of consciousness as having arisen through association, but he also—in a somewhat artificial fashion—reduces all associations to the association of such ideas as have frequently occurred together (which has since been called association by contiguity). . . . As Bentham had attempted to base the whole of ethics on the single principle that pleasure is preferable to pain, so James Mill attempts to construct the whole of psychology on the single principle that that which has been once experienced can be recalled when experiences which occurred with it, either in space or time, are repeated" (Höffding, *Hist. of Mod. Phil.* ii. 371). The implication of the Benthamite doctrine as interpreted by Mill, which took too little account of all emotions save one, and of the unconscious and involuntary elements in life, was fiercely fought by Samuel Taylor Coleridge.

MILL, JOHN STUART (1806–1873), English philosopher and economist, son of James Mill (*q.v.*), was born on May 20, 1806 in his father's house in Pentonville, London. He was educated exclusively by his father, who was a strict disciplinarian, and at the age of three was taught the Greek alphabet and long lists of Greek words with their English equivalents. By his eighth year he had read Aesop's *Fables,* Xenophon's *Anabasis,* and the whole of Herodotus, and was acquainted with Lucian, Diogenes Laërtius, Isocrates and six dialogues of Plato. (*See* his *Autobiography.*) He had also read a great deal of history in English—Robertson's histories, Hume, Gibbon, Robert Watson's *Philip II.* and *Philip III.,* Hooke's *Roman History,* part of a translation of Rollin's *Ancient History,* Langhorne's *Plutarch,* Burnet's *History of My Own Times,* 30 volumes of the *Annual Register,* Millar's *Historical View of the English Government,* Mosheim's *Ecclesiastical History,* M'Crie's *Knox,* and two histories of the Quakers. A contemporary record of Mill's studies from eight to thirteen is published in Bain's sketch of his life. It shows that the *Autobiography* rather understates the amount of work done. At the age of eight he began Latin, Euclid, and algebra, and began to

teach the younger children of the family. His main reading was still history, but he went through all the Latin and Greek authors commonly read in the schools and universities. He was never an exact scholar; it was for the subject matter that he was required to read, and by the age of ten he could read Plato and Demosthenes with ease. His father's *History of India* was published in 1818; immediately thereafter, about the age of twelve, John began a thorough study of the scholastic logic, at the same time reading Aristotle's logical treatises in the original. In the following year he was introduced to political economy and studied Adam Smith and Ricardo with his father.

Not unnaturally the training which the younger Mill received has aroused amazement and criticism. The really important part of the training was the close association with the strenuous character and vigorous intellect of his father; from his earliest days he spent much time in his father's study and habitually accompanied him on his walks in North London. It was an inevitable result of such an education that Mill acquired many of his father's speculative opinions, and his father's way of defending them. But he did not receive the impress passively and mechanically. "One of the grand objects of education," according to the elder Mill, "should be to generate a constant and anxious concern about evidence." The duty of collecting and weighing evidence for himself was at every turn impressed upon the boy; he was taught to accept no opinion on authority. He was deliberately educated to think for himself, and never to accept any proposition on authority, but to reason for himself. His childhood was not unhappy, but there is no doubt that it was a strain on his constitution, and that he suffered from the lack of natural unforced development. He was over-educated.

From May 1820 till July 1821 Mill was in France in the family of Sir Samuel Bentham, brother of Jeremy Bentham. Copious extracts from a diary kept by him at this time are given by Bain; they show how methodically he read and wrote, studied chemistry and botany, tackled advanced mathematical problems, made notes on the scenery and the people and customs of the country. He also gained a thorough acquaintance with the French language. On his return in 1821 he added to his work the study of psychology, and that of Roman law, which he read with John Austin, his father having half decided on the bar as the best profession open to him. In 1822, however, when he had just completed his seventeenth year, this intention was abandoned, and he entered the examiner's office of the India House, nominally as a clerk, but from the first he was more than that, and after a short apprenticeship he was promoted, in 1828, to assistant-examiner. For twenty years, from 1836 (when his father died) to 1856, Mill had charge of the Company's relations with the native states, and in 1856 he became chief of the office. Few statesmen of his generation had a wider experience of the responsible application of the principles of government.

About the time of his entering the India House Mill read Dumont's exposition of Bentham's doctrines in the *Traité de Législation*, which made a lasting impression upon him. When he laid down the last volume, he says, he had become a different being. It gave unity to the detached and fragmentary parts of his knowledge and beliefs. The impression was confirmed by the study of the English psychologists, also of Condillac and Helvetius, and in 1822–23 he established among a few friends the "Utilitarian" Society, taking the word, as he tells us, from Galt's *Annals of the Parish*. Two newspapers were open to him—the *Traveller*, edited by a friend of Bentham's, and the *Morning Chronicle*, edited by his father's friend Black. One of his first efforts was a solid argument for freedom of discussion, in a series of letters to the *Chronicle* on the prosecution of Richard Carlile. He seized every chance for exposing departures from sound principle in parliament and courts of justice. Another outlet was opened up for him (April 1824) by the starting of the *Westminster Review*, which was the organ of the philosophic radicals. In 1825, too, he edited Bentham's *Rationale of Judicial Evidence*. He discussed eagerly with the many men of distinction who came to his father's house, and engaged in set discussions at a reading society formed at Grote's house in 1825, and in set debates at a Speculative Society formed in the same year.

The *Autobiography* tells how in 1826 Mill's enthusiasm was checked by a misgiving as to the value of the ends which he had set before him. At the Speculative Debating Society, where he first measured his strength in public conflict, he found himself looked upon with curiosity as a precocious phenomenon, a "made man," an intellectual machine set to grind certain tunes. He now saw that regard for the public good was too vague an object for the satisfaction of a man's affections. It is a proof of the dominating force of his father's character that it cost the younger Mill such an effort to shake off his stern creed about poetry and personal emotion. Like Plato, the elder Mill would have put poets under ban as enemies of truth, and he subordinated private to public affections, Landor's maxims of "few acquaintances, fewer friends, no familiarities" had his cordial approval. These doctrines the younger Mill now felt himself forced in reason to abandon. Too much in awe of his father to make him a confidant, he wrestled in gloomy solitude. He emerged from the struggle with a more catholic view of human happiness, a delight in poetry for its own sake, a more placable attitude in controversy, a hatred of sectarianism, an ambition, no less noble and disinterested, but moderated to practical possibilities. Gradually the debates in the Speculative Society attracted men whose society was invigorating and inspiring, among others Maurice and John Sterling. He ceased to attend the society in 1829, but he carried away from it the conviction that a true system of political philosophy was "something much more complex and many-sided than he had previously had any idea of, and that its office was to supply, not a set of model institutions but principles from which the institutions suitable to any given circumstances might be deduced."

His letters in the *Examiner* in the autumn of 1830 after a visit to Paris, where he made the acquaintance of the younger liberals, may be taken as marking his return to hopeful aspiring activity. His enthusiasm for humanity had been thoroughly reawakened, and had taken shape as an aspiration to supply an unimpeachable method of search for conclusions in moral and social science. But he could not at once shake off his early training. He had been bred by his father in a great veneration for the syllogistic logic as an antidote against confused thinking. He attributed to his early discipline in this logic an impatience of vague language which in all likelihood was really fostered in him by his study of the Platonic dialogues and of Bentham, for he always had in himself more of Plato's fertile ingenuity in canvassing the meaning of vague terms than the schoolman's rigid consistency in the use of them. But he was determined that the new logic should stand in no antagonism to the old. In his *Westminster* review of Whately's *Logic* in 1828 he defended the syllogistic logic against highfliers such as the Scottish philosophers who talk of "superseding" it by "a supposed system of inductive logic." His inductive logic must "supplement and not supersede." But for several years he searched in vain for the means of concatenation.

Meantime, he had ceased (1828) to write for the *Westminster*, but during the years 1832 and 1833 he contributed many essays to *Tait's Magazine*, the *Jurist*, and the *Monthly Repository*. In 1835 Sir William Molesworth founded the *London Review* with Mill as editor; it was amalgamated with the *Westminster* (as the *London and Westminster Review*) in 1836, and Mill continued editor (latterly proprietor also) till 1840. Some of his essays written for these journals were reprinted in his first two volumes of *Dissertations and Discussions* (1859). The essays on Bentham and Coleridge constituted the first manifesto of the new spirit which Mill sought to breathe into English Radicalism. In 1837, on reading Whewell's *Inductive Sciences* and re-reading Herschel, Mill at last saw his way clear both to formulating the methods of scientific investigation and joining on the new logic as a supplement to the old. The *Logic* was published in 1843. In 1844 appeared his *Essays on Some Unsettled Questions in Political Economy*. Four out of the five are solutions of perplexing technical problems—the distribution of the gains of international commerce, the influence of consumption on production, the definition of productive and unproductive labour, the precise relations between profits and wages. Though Mill appears here purely as the

disciple of Ricardo, striving after more precise statement, and reaching forward to further consequences, he appears as an original and independent thinker.

That originality and independence became more conspicuous when he reached his second stage as a political economist, struggling forward towards the standpoint from which his systematic work was written.

While his great systematic works were in progress, Mill turned aside for a few months from his *Political Economy* during the winter of the Irish famine (1846–47) to advocate the creation of peasant-proprietorships as a remedy for distress and disorder in Ireland. The *Political Economy* was published in 1848. Mill now made a more thorough study of Socialist writers, and began to look upon some more equal distribution of the produce of labour as a practicability of the remote future, and to dwell upon the prospect of such changes in human character as might render a stable society possible without the institution of private property. Mill was convinced that the social question was as important as the political question. He desired the extension of the franchise, but he never saw it as the panacea for all ills. He declined to accept property, devised originally to secure peace in a primitive society, as necessarily sacred in its existing developments in a quite different stage of society. He separated questions of production and distribution, and he examined with an open mind Socialist solutions. He could not rest satisfied with a distribution which condemned the labouring classes to a cramped and wretched existence, and in many instances to starvation. He did not come to a socialist solution, but he had the great merit of having considered afresh the foundations of society.

This he has called his third stage as a political economist, and he says that he was helped towards it by the lady, Mrs. Taylor (Harriet Hardy), who became his wife in 1851. It is generally supposed that he writes with a lover's extravagance about this lady's powers when he compares her with Shelley and Carlyle. But he expressly says that he owed none of his technical doctrine to her, that she influenced only his ideals of life for the individual and for society; the only work perhaps which was directly inspired by her is the essay on the enfranchisement of women (*Dissertations*, vol. ii.). It is obvious that his real emancipation began when he threw off his father's authority, and entered on married life, against the wishes of his family. This new inner life was strengthened and enlarged by Mrs. Taylor.

During the seven years of his married life Mill published less than in any other period of his career, but four of his most closely reasoned and characteristic works, the *Liberty*, the *Utilitarianism*, the *Thoughts on Parliamentary Reform*, and the *Subjection of Women*, besides his posthumously published essays on *Nature* and on the *Utility of Religion*, were thought out and partly written in collaboration with his wife. In 1856 he became head of the examiner's office in the India House, and for two years, till the dissolution of the Company in 1858, his official work, never a light task, kept him fully occupied. It fell to him as head of the office to write the defence of the Company's government of India when the transfer of its powers was proposed. Mill opposed the transfer, and the documents in which he defended the Company's administration are models of trenchant and dignified pleading.

On the dissolution of the Company Mill was offered a seat in the new council, but declined, and retired with a pension of £1,500. His retirement from official work was followed almost immediately by his wife's death at Avignon. Mill spent most of the rest of his life at a villa at St. Véran, near Avignon, returning to his Blackheath house only for a short period in each year. He sought relief in active literary occupation, in politics, sociology and psychology. He published, with a touching dedication to his wife, the treatise on *Liberty*. He then turned to politics, and published, in view of the impending Reform Bill, a pamphlet on parliamentary reform. In the autumn of the same year he turned to psychology, reviewing Bain's works in the *Edinburgh Review*. In his *Representative Government* (1860) he systematized opinions already put forward in many casual articles and essays. His *Utilitarianism* (published in *Fraser's* in 1861) was a closely-reasoned systematic attempt to answer objections to his ethical theory and remove misconceptions of it. He was especially anxious to make it clear that he included in "utility" the pleasures of the imagination and the gratification of the higher emotions, and to show how powerfully the good of mankind as a motive appealed to the imagination. His next treatise, *The Subjection of Women*, was not published till 1869. He was one of the founders, with Mrs. P. A. Taylor, Miss Emily Davies and others, of the first women's suffrage society, which developed into the National Union of Women's Suffrage Societies, and his writings are the classical theoretical statement of the case for women's suffrage. He presented to Parliament the first petition on the subject. (*See* further Blackburn, *Women's Suffrage Record*.) His *Examination of Hamilton's Philosophy*, published in 1865, had engaged a large share of his time for three years before.

While mainly occupied in those years with philosophical studies, Mill did not remit his interest in current politics. He supported the North in the American crisis of 1862, using all his strength to explain what has since been universally recognized as the issue really at stake in the struggle, the abolition of slavery. Huxley, Tyndall, Cairnes, Mark Pattison, F. Harrison, Sir Frederick Pollock and Lockyer were among the contributors.

In 1865 he stood as parliamentary candidate for Westminster, on conditions strictly in accordance with his principles. He would not canvass, nor pay agents to canvass for him, nor would he engage to attend to the local business of the constituency. He was with difficulty persuaded even to address a meeting of the electors, but was elected. He took an active part in the debates on Disraeli's Reform Bill (moving, on April 12, 1866, an amendment to omit the word "man" and insert "person"), and helped to extort from the government several useful modifications of the Bill for the Prevention of Corrupt Practices. The reform of land tenure in Ireland, the representation of women, the reduction of the national debt, the reform of London government, the abrogation of the Declaration of Paris, were among the topics on which he spoke with marked effect. He took occasion more than once to enforce what he had often advocated in writing, England's duty to intervene in foreign politics in support of the cause of freedom. As a speaker Mill was somewhat hesitating, pausing occasionally as if to recover the thread of his argument, but he showed great readiness in extemporaneous debate.

Mill's subscription to the election expenses of Bradlaugh, and his attack on the conduct of Governor Eyre in Jamaica were perhaps the main causes of his defeat in the general election of 1868. But his studied advocacy of unfamiliar projects of reform had made him unpopular with "moderate Liberals." He retired with a sense of relief to his cottage and his literary life at Avignon. His little cottage was filled with books and newspapers; the beautiful country round it furnished him with a variety of walks; he read, wrote, discussed, walked, botanized. He was extremely fond of music, and was himself a fair pianist. His step-daughter, Miss Taylor (d. January 1907), was his constant companion after his wife's death. Mill was an enthusiastic botanist all his life long, and a frequent contributor of notes and short papers to the *Phytologist*. One of the things that he looked forward to during his last journey to Avignon was seeing the spring flowers and completing a flora of the locality. His delight in scenery frequently appears in letters written to his friends during his summer and autumn tours.

Yet he did not relax his laborious habits nor his ardent outlook on human affairs. The essays in the fourth volume of his *Dissertations*—on endowments, on land, on labour, on metaphysical and psychological questions—were written for the *Fortnightly Review* at intervals after his short parliamentary career. One of his first tasks was to send his treatise on the *Subjection of Women* (written 1861, published 1869, many editions) through the press. The essay on *Theism* was written soon after. The last public work in which he engaged was the starting of the Land Tenure Reform Association. The interception by the state of the unearned increment, and the promotion of co-operative agriculture, were the most striking features in his programme. He wrote in the *Examiner* and made a public speech in favour of the association a few months before his death. The secret of the ardour with which he took up this question probably was his

conviction that a great struggle was impending in Europe between labour and capital. He regarded his project as a timely compromise.

Mill died at Avignon on May 8, 1873. He was a man of extreme simplicity in his method of life. His services in ethics, politics and philosophy lay not so much in his actual achievement as in his personality and the liberal and inquiring spirit in which he handled the great questions of his time. A statue in bronze was placed on the Thames Embankment, and there is a good portrait by Watts (a copy of which, by Watts himself, was hung in the National Gallery).

The influence which Mill's works exercised upon contemporary English thought can scarcely be over-estimated. In philosophy his chief work was to systematize and expound the utilitarianism of his father and Bentham. (*See* UTILITARIANISM.) He may, in fact, be regarded as the final exponent of that empirical school of philosophy which owed its impulse to John Locke, and is generally spoken of as being typically English. Its fundamental characteristic is the emphasis laid upon human reason, *i.e.*, upon the duty incumbent upon all thinkers to investigate for themselves rather than to accept the authority of others. Knowledge must be based upon experience. In reasserting and amplifying the empirical conclusions of his predecessors, especially in the sphere of ethics, Mill's chief function was the introduction of the humanist element. This was due, no doubt, to his revulsion from the sternness of his upbringing and the period of stress through which he passed in early manhood, but also to the sympathetic and emotional qualities which manifested themselves in his early manhood. We have seen, for example, that he was led to investigate the subject of logic because he found in attempting to advance his humanitarian schemes in politics an absence of that fundamental agreement which he recognized as the basis of scientific advance. Both his logical and his metaphysical studies were thus undertaken as the pre-requisites of a practical theory of human development. Though he believed that the lower classes were not yet ripe for Socialism, with the principles of which he (unlike James Mill and Bentham) was in general agreement, his whole life was devoted to the amelioration of the conditions of the working classes. This fact, no doubt, should be taken into account in any detailed criticism of the philosophic work; it was taken up not as an end but as ancillary to a social and ethical system Reference to the articles on LOGIC, METAPHYSICS, etc., will show that subsequent criticism, however much it has owed by way of stimulus to Mill's strenuous rationalism, has been able to point to much that is inconsistent, inadequate and even superficial in his writings. Two main intellectual movements from widely different standpoints combined to diminish his influence: the idealism of the German school and the application of the evolutionary theory to ethics. In the sphere of psychology, likewise—*e.g.*, in connection with Mill's doctrine of Association of Ideas (*q v.*) and the phrase "Mental Chemistry," by which he sought to meet the problems which Associationism left unsolved—modern criticism and the experimental methods of the psychophysiological school have set up wholly new criteria, with a new terminology and different fields of investigation. (*See* PSYCHOLOGY)

A similar fate has befallen Mill's economic theories. The title of his work, *Principles of Political Economy, with some of their Applications to Social Philosophy,* though open to criticism, indicated a less narrow and formal conception of the field of the science than had been common amongst his predecessors. It is an admirably lucid, and even elegant, exposition of the Ricardian economics, the Malthusian theory being of course incorporated with these; but, notwithstanding the introduction of many minor novelties, it is in its scientific substance little or nothing more.

With respect to economic method he shifted his position, yet to the end occupied uncertain ground. In the fifth of his early essays he asserted that the method a priori is the only mode of investigation in the social sciences, and that the method a posteriori "is altogether inefficacious in those sciences as a means of arriving at any considerable body of valuable truth." When he wrote his *Logic* he had learned from Comte that the a posteriori method—in the form which he chose to call "inverse deduction"—was the only mode of arriving at truth in general sociology; and his admission of this at once renders the essay obsolete. But, unwilling to relinquish the a priori method of his youth, he tries to establish a distinction of two sorts of economic inquiry, one of which, though not the other, can be handled by that method. Sometimes he speaks of political economy as a department "carved out of the general body of the science of society"; whilst on the other hand the title of his systematic work implies a doubt whether political economy is a part of "social philosophy" at all, and not rather a study preparatory and auxiliary to it. Thus, on the logical as well as the dogmatic side, he halts between two opinions. Notwithstanding his misgivings and even disclaimers, he yet remained as to method a member of the old school, and never passed into the new "historical" school.

In political philosophy his greatest work was done as an advocate of liberty. In the treatise *On Liberty* he shows that political liberty alone is insufficient, that social tyranny may be more grinding than legal tyranny. And he showed consistently that any despotism, however benevolent, must in fact cramp and destroy the development of any people. He was torn all his life between his passion for individual liberty and initiative and his sense of the benefits of social control.

BIBLIOGRAPHY.—*Works: System of Logic* (2 vols., 1843; 9th ed., 1875; "People's" ed., 1884); *Essays on some Unsettled Questions of Political Economy* (1844, ed. 1874); *Principles of Political Economy* (2 vols., 1848; many ed., especially ed. by W. J. Ashley, 1909); *On Liberty* (1859; ed. Courtney, 1892, W. B. Columbine, 1903; with introd. Pringle-Pattison, 1910); *Thoughts on Parliamentary Reform* (1859); *Dissertations and Discussions* (i., ii., 1859; iii., 1867; iv. 1876); *Considerations on Representative Government* (1861; 3rd ed. 1865); *Utilitarianism* (1863); *Examination of Sir W. Hamilton's Philosophy* (1865); *Aug. Comte and Positivism* (1865, ed. 1908); *Inaugural Address at the University of St. Andrews* (1867); *England and Ireland* (1868); *Subjection of Women* (1869; ed. with introd. by Stanton Coit, 1906); *Chapters and Speeches on the Irish Land Question* (1870). The *Autobiography* appeared in 1873 (ed. 1908), and *Three Essays on Religion* (1874). Many of these have been translated into German, and there is a German edition by Th. Gomperz (12 vols., 1873–80). A convenient edition in the New Universal Library appeared between 1905 and 1910.

Biographical and Critical.—Many of Mill's letters are published in Mrs. Grote's life of her husband, in Duncan's *Life of Herbert Spencer,* in the *Memories* of Caroline Fox, and in Kingsley's letters. There are also editions of the correspondence with Gustave d'Eichtal and Comte (specially that of Lévy-Bruhl, 1899). By far the most illuminating collection is that of Hugh Elliott, *Letters of John Stuart Mill* (2 vols., 1910), which contains letters to John Sterling, Carlyle, E. Lytton Bulwer (Lord Lytton), John Austin, Alex. Bain, and many leading French and German writers and politicians. These letters are essential to an understanding of Mill's life and thought. Besides the *Autobiography* and many references in the writings of Mill's friends (*e.g.* Alex. Bain's *Autobiography,* 1904), *see* further A. Bain, *John Stuart Mill, a Personal Criticism* (1882); Fox Bourne, *Life of J. S. Mill* (1873); John (Viscount) Morley, *Miscellanies* (1877), ii. 239–327; J. E. Cairnes, *J. S. Mill* (1873), on economic theories, W. L. Courtney, *Metaphysics of J. S. Mill* (1879) and *Life* (1889); Douglas, *John Stuart Mill, a Study of his Philosophy* (1895), and *Ethics of J. S. Mill* (1897); Albee, *Hist. of Eng. Utilitarianism* (1902); Sir Leslie Stephen, *The English Utilitarians* (1900); J. MacCunn, *Six Radical Thinkers* (1907); Fred. Harrison, *Tennyson, Ruskin, Mill* (1899); John Watson, *Comte, Mill and Spencer* (1895); T. Whittaker, *Comte and Mill* (1905); Charles Douglas, *J. S. Mill, a Study of his Philosophy* (1895); J. Rickaby, *Free Will and Four English Philosophers* (1906); J. M. Robertson, *Modern Humanists* (1891); D. G. Ritchie, *Principles of State Interference* (1891); W. Graham, *English Political Philosophy from Hobbes to Maine* (1899). There are also a number of valuable French and German criticisms, *e.g.*, Taine, *Positivisme anglais, étude sur Stuart Mill* (Paris, 1864); F. A. Lange, *Mills Ansichten über die soziale Frage* (Duisburg, 1866); Littré, *A. Comte et Stuart Mill* (3rd ed., Paris, 1877); Cauret, *Philosophie de Stuart Mill* (Paris, 1885); Gomperz, *John S. Mill, ein Nachruf* (Vienna, 1889); S. Sanger, *J. S. Mill, sein Leben und Lebenswerk* (Stuttgart, 1901); S. Becher, *Erkenntnistheoretische Untersuchungen zu Stuart Mills Theorie der Kausalität* (1906); E. M. Kantzer, *La Religion de J. S. Mill* (1906); F. Degenfeld-Schonburg, *Die Lohntheorien von Adam Smith, John Stuart Mill, etc.* (1914); E. Wentscher, *Das Problem des Empirismus, dargest. an J. S. Mill* (1922); B. Alexander, *J. St. Mill und der Empirismus* (1927). *See* also histories of modern philosophy for later criticisms and developments of Mill's ideas.

See further LOGIC (Historical Sketch); PSYCHOLOGY; ASSOCIATION OF IDEAS.

MILL, the term given to the apparatus used in the grinding of corn into flour, and hence applied to similar mechanical devices for grinding or pulping other substances; *e.g.*, coffee-mill, powder-mill. "Mill" was first used of the building containing the apparatus, frequently with a word attached descriptive of the motive power; *e.g.*, wind-mill, water-mill, etc. It was not the early word used of the actual grinding mechanism. The old hand-mill was known as a "quern" (*see* FLOUR). The word mill is also applied to many mechanical devices by which raw material is transformed into a condition ready for use or into a stage preparatory to other processes; *e.g.*, saw-mill, rolling-mill, etc., or still more widely to buildings containing machinery used in manufactures; *e.g.*, cotton-mill. In mining it is applied to various machines used in breaking and crushing the ore (*see* ORE-DRESSING).

In the engineering industries milling machines constitute a very important class of machine tools, the characteristic of which is that rotary cutters are employed for shaping the metal (*see* TOOLS). In coins the "milling" is the serrated edge, called "creneling" by John Evelyn (*Discourse on Medals,* 1697, p. 225), which is formed on them to prevent clipping and filing. Coins made by the old process of hammering were apt to have irregular edges which invited mutilation; but the introduction of the screw-press, which came to be known as a mill (*cf.* W. Lowndes, *Amendm. Silver Coinage,* 1695, p. 93), permitted the production of a regular edge with serrations which in consequence were termed milling. This machine also enabled legends to be impressed round the edges of coins, such as the *Decus et tutamen* suggested by Evelyn (*see* W. J. Hocking, *Catalogue of the Coins, etc., in the Museum of the Royal Mint,* 1906). It was invented about the middle of the 16th century, and has generally been attributed to Guyot Brucher (d. 1556), who was succeeded at the Paris mint by his brother Antoine. Introduced into England by one Eloye Mestrel in 1561, it was used for 12 years, and was then abandoned owing to the opposition of the mint officials to Mestrel, who was executed for counterfeiting and striking money outside the precincts of the Tower of London; but it was again introduced by one Peter Blondeau in 1662, when it permanently superseded hammering. In the United States of America the term "milling" or "milled" is applied to the raised edge on the face of the coin; this is known in the British mint as "marking" (*see* MINT).

MILLAIS, SIR JOHN EVERETT (1829–1896), English painter, was born at Southampton on June 8, 1829, the son of John William Millais, who belonged to an old Norman family settled in Jersey for many generations, and Emily Mary, *née* Evamy, the widow of a Mr. Hodgkinson. After his birth the family returned to Jersey. In 1835 they removed to Dinan in Brittany. In 1838 he came to London, and on the strong recommendation of Sir Martin Archer Shee, P.R.A., his future was decided. He was sent to Sass's school, and entered the Academy schools in 1840. He won a silver medal from the Society of Arts in 1839, and carried off all the prizes at the Royal Academy. He was at this time painting small pictures for a dealer named Thomas, and defraying a great part of the household expenses in Gower Street, where his family lived. In 1846 he exhibited "Pizarro seizing the Inca of Peru" at the Royal Academy. In 1847 he competed unsuccessfully for the decoration of the Houses of Parliament, sending a very large picture of "The Widow's Mite."

In 1848 Millais and W. Holman Hunt, dissatisfied with the theory and practice of British art, initiated what is known as the Pre-Raphaelite movement, and were joined by Dante Gabriel Rossetti, and afterwards by five others, altogether forming the Pre-Raphaelite Brotherhood. Rossetti was then engaged, under the technical guidance of Hunt, upon his picture of "The Girlhood of Mary Virgin," which, with Hunt's "Light of the World" and Millais's "Christ in the House of His Parents," forms what has been called the trilogy of Pre-Raphaelite art. According to Millais, the Pre-Raphaelites had but one idea—"to present on canvas what they saw in Nature." Millais's first picture on his new principles was a banquet scene from Keats's "Isabella" (1849), and contains all the characteristics of Pre-Raphaelite work, including minute imitation of nature down to the smallest detail. The tale was told with dramatic force, and the expression of the heads was excellent. His next important picture, "Christ in the House of His Parents," or "The Carpenter's Shop" (1850), representing a supposed incident in the childhood of our Lord treated in a realistic manner, drew down upon him a storm of abuse. The rest of his more strictly Pre-Raphaelite pictures—"The Return of the Dove to the Ark," "The Woodsman's Daughter" and the "Mariana" of 1851, "The Huguenot" and "Ophelia" of 1852, "The Proscribed Royalist" and "The Order of Release" of 1853—met with less opposition, and established his reputation with the public. Indeed, this may be said to have been accomplished by "The Huguenot" and "Ophelia." The public were also greatly influenced by the championship of Ruskin, who, in letters to *The Times,* and in a pamphlet called "Pre-Raphaelitism," enthusiastically espoused the cause of the Brotherhood. Millais became acquainted with Ruskin, and in 1853 went to Scotland with him and Mrs. Ruskin, the latter of whom sat for the woman in "The Order of Release." In 1855 Millais exhibited "The Rescue," a scene from a fire. This was also the year of his marriage with Mrs. Ruskin (Euphemia Chalmers, daughter of Mr. George Gray of Bowerswell, Perth), who had obtained a decree of the nullity of her previous marriage. The principal pictures of 1856 were "Autumn Leaves" and "Peace Concluded"; of 1857 "Sir Isumbras at the Ford," and "The Escape of a Heretic"; of 1859, "Apple-blossoms" and "Vale of Rest." The "Black Brunswicker" of 1860 was in motive very like the "Huguenot," but it was a great deal broader in execution, and may be said to mark the end of the period of transition from his minute Pre-Raphaelite manner to the freedom of his mature style.

From 1860 to 1869 Millais was much employed in illustration, especially of Trollope's novels. He contributed to Moxon's illustrated edition of *Tennyson's Poems,* and made occasional drawings for *Once a Week,* the *Illustrated London News, Good Words,* and other periodicals and books. In 1863 he was elected a Royal Academician. The most important pictures of this and the next few years were "The Eve of St. Agnes," "Romans leaving Britain" (1865), "Jephthah" (1867), "Rosalind and Celia" (1868), "A Flood," and "The Boyhood of Raleigh" (1870). In many of his pictures of this period, such as "The Boyhood of Raleigh," his children were his models. In 1871 he exhibited the first and most popular of his pure landscapes, called "Chill October." Other landscapes from Perthshire, where he generally spent the autumn, included "Scotch Firs" and "Winter Fuel" (painted in 1874), "Over the Hills and Far Away," and "The Fringe of the Moor" (1875) and "The Sound of Many Waters" (1876).

WORKS OF LATER YEARS

It was to the painting of nature and the world around him that he devoted himself principally for the last 25 years of his life, abandoning imaginative or didactic themes. To this period belong a number of pictures of children, like "Cherry Ripe," "Little Miss Muffet," and "Bubbles." Amongst his more serious pictures were "The Princes in the Tower" (1878), "The Princess Elizabeth" (1870), two pictures from Scott—"Effie Deans" and "The Master of Ravenswood"—"A Yeoman of the Guard" (1877), and "The North-West Passage" (1874), representing an old mariner (painted from Edward John Trelawney, the friend of Byron) listening to some tale of Arctic exploration in a room overlooking the sea and strewn with charts. Amongst the works of his later years were his three portraits of Gladstone (1879, 1885 and 1890), and those of John Bright, of Lord Tennyson, and of Lord Beaconsfield, the last of which was left unfinished at his death. He also painted the marquess of Salisbury, Lord Rosebery, the dukes of Devonshire and Argyll, Cardinal Newman, Thomas Carlyle, Sir James Paget, Sir Henry Irving, George Grote, Lord Chief Justice Russell, J. C. Hook, R.A., and himself (Uffizi Gallery, Florence). He drew Charles Dickens after his death. Amongst his portraits of women were those of Mrs. Bischoffsheim, the duchess of Westminster, Lady Campbell and Mrs. Jopling.

In 1879 Millais left Cromwell Place for a house at Palace Gate, Kensington, which he built, and where he died. In 1885 he was created a baronet. Among his last works are: "St. Stephen," "A Disciple," "Speak! Speak!" (which was bought out of the Chantrey Bequest), and "The Forerunner"—his last exhibited subject-picture. His finely-characterized portraits of Mr. John Hare, the actor, and Sir Richard Quain belong also to his last years. On the death of Lord Leighton he was elected to the presidential chair of the Royal Academy. He died on Aug. 13, 1896, and was buried in St. Paul's Cathedral. The Winter Exhibition of the Royal Academy in 1898 was devoted to his works. The National Gallery of British Art possesses many of his finest works. He is also represented in the National Gallery, in the National Portrait Gallery, the Victoria and Albert museum, and many other public galleries including those of Manchester, Liverpool and Birmingham.

H. Spielmann, *Millais and his Works* (1896); A. L. Baldry, *Sir J. E. Millais, his Art and Influence* (1899); J. E. Reid, *Sir J. E. Millais* (1909). (C. MON.; X.)

MILLAR, ANDREW (1707–1768), British publisher, started business as a bookseller and publisher in the Strand, London, about 1729. His own judgment in literary matters was small, but he collected an excellent staff of literary advisers, and paid what at the time were large prices for good material. "I respect Millar, sir," said Dr. Johnson in 1755, "he has raised the price of literature." He paid Thomson £105 for *The Seasons,* and Fielding £700 for *Tom Jones* and £1,000 for *Amelia.* He was one of the syndicate of booksellers who financed Johnson's *Dictionary.* He also published the histories of Robertson and Hume. He died at Kew Green, London, on June 8, 1768.

MILLAU, a town of southern France, capital of an arrondissement in the department of Aveyron, on the Tarn at its confluence with the Dourbie, 74 m. N. of Béziers on the Southern railway. Pop. (1926) 14,033. In the middle ages Millau was the seat of a viscounty held by the counts of Barcelona and afterwards by the counts of Armagnac. It became a leading stronghold of Calvinism and revolted against Louis XIII. (1620); after its submission, Richelieu caused its fortifications to be dismantled. The edict of Nantes hastened the decline of the town, which did not recover till after the Revolution. Millau lies in a valley 1,200 ft. above the sea surrounded by the spurs of the Levezou, Causse Noir and Larzac ranges. One of its squares is bordered on two sides by wooden galleries on stone columns. The Romanesque church of Notre Dame was restored in the 16th century; there is a fine Gothic belfry on the old *hôtel de ville.* Millau is seat of a sub-prefect, and possesses a tribunal of commerce, a board of trade-arbitrators and a chamber of commerce. Glove making and leather-work are carried on. The chief articles of trade are skins, wool, timber, furniture and Roquefort cheese.

MILLAY, EDNA ST. VINCENT (1892–), American poet, was born in Rockland, Me., on Feb. 22, 1892. She graduated from Vassar in 1917 and was married in 1923 to Eugen Jan Boissevain. She was awarded the Pulitzer prize in 1923 for her volume, *The Harp-Weaver.* In 1925 she was commissioned by the directors of the Metropolitan Opera Company to write the book for an opera, the music of which was to be composed by Deems Taylor; the result of their collaborations, *The King's Henchman,* first presented in 1927, was a greater success than any previous American opera. Her works include *Renascence and Other Poems* (1917); *A Few Figs from Thistles* (1920); *Second April* (1921); *Distressing Dialogues* (1924, under the pseudonym Nancy Boyd); *Three Plays* (1926), which reprints her earlier publications, *Two Slatterns and a King* (1921), *Aria da Capo* (1920) and *The Lamp and the Bell* (1921); and *The Buck in the Snow* (1928). *See* J. H. Preston, "Edna St. Vincent Millay" in *Virginia Quarterly* (vol. 3, 1927).

MILLBOARD: *see* CARDBOARD.

MILLBURY, a town of Worcester county, Massachusetts, U.S.A., on the Blackstone river, and on the Boston and Albany and the New Haven railways. The population was 5,653 in 1920 (22% foreign-born white), and was 6,957 in 1930 Federal census. It is a manufacturing town, making chiefly cotton, woollen and linen goods, thread, felt and edge tools. Millbury was set off from Sutton and incorporated as a separate town in 1813.

MILLE, PIERRE (1864–), French man of letters, was born at Choisy-le-Roi in 1864, and educated at the Collège Rollin. He has taken part in many expeditions for the exploration of West Africa, the Congo, Indo-China and British India. During the Greco-Turkish War (1897) he acted as war correspondent for the *Journal des Débats,* and he served the *Temps* in the same capacity during the World War. His best works are *Barnavaux et quelques Femmes* (1908), *Caillou et Tili,* and *le Monarque.* The central figures in these tales have in common their power to see life only through the imagination.

MILLEDGEVILLE, a city of central Georgia, U.S.A., the county seat of Baldwin county; on the Oconee river, 32 m. N.E. of Macon. It is served by the Central of Georgia and the Georgia railways. The population was 4,619 in 1920, 5,534 in 1930. It is the seat of the Georgia State college for Women (1889), the State penitentiary and reformatory, and the State hospitals for white and for coloured insane. Milledgeville was founded in 1803 and chartered as a city in 1836. It was named after John Milledge (1757–1818), then governor of Georgia. From 1804 until 1868 it was the State capital, and a centre of wealth and culture. The governor's mansion, built in 1838, is now the residence of the president of the State college. On Nov. 23, 1864, Gen. Sherman entered the city. To save the State documents from the enemy, Governor Joseph E. Brown used the services of the convicts in the penitentiary, granting them pardons in return.

MILLENNIUM, literally a period of a thousand years, (a pseudo-Latin word formed on the analogy of *biennium, triennium,* from Lat. *mille,* a thousand, and *annus,* year). The term is specially used of the period of 1,000 years during which Christ, as has been believed, would return to govern the earth in person. Hence it is used to describe a vague time in the future when all flaws in human existence will have vanished, and perfect goodness and happiness will prevail.

Faith in the nearness of Christ's second advent and the establishing of his reign of glory on the earth was undoubtedly a strong point in the primitive Christian Church. In the anticipations of the future prevalent amongst the early Christians (*c.* 50–150) it is necessary to distinguish a fixed and a fluctuating element. The former includes (1) the notion that a last terrible battle with the enemies of God was impending; (2) the faith in the speedy return of Christ; (3) the conviction that Christ will judge all men, and (4) will set up a kingdom of glory on earth. To the latter belong views of the Antichrist, of the heathen world-power, of the place, extent, and duration of the earthly kingdom of Christ, etc. These remained in a state of solution; they were modified from day to day, partly because of the changing circumstances of the present by which forecasts of the future were regulated, partly because the indications—real or supposed—of the ancient prophets always admitted of new combinations and constructions. But even here certain positions were agreed on in large sections of Christendom. Amongst these was the expectation that the future kingdom of Christ on earth should have a fixed duration—according to the most prevalent opinion, a duration of 1,000 years. From this fact the whole ancient Christian eschatology was known in later times as "chiliasm"—a name which is not strictly accurate, since the doctrine of the millennium was only one feature in its scheme of the future.

This idea that the Messianic kingdom of the future on earth should have a definite duration has—like the whole eschatology of the primitive Church—its roots in the Jewish apocalyptic literature, where it appears at a comparatively late period. At first it was assumed that the Messianic kingdom in Palestine would last for ever (so the prophets; *cf.* Jer. xxiv. 6; Ezek. xxxvii. 25; Joel iv. 20; Dan. vi. 27; Sibyll. iii. 49 *seq.,* 766; Psalt. Salom. xvii. 4; Enoch lxii. 14), and this seems always to have been the most widely accepted view (John xii. 34). But from a comparison of prophetic passages of the Old Testament learned apocalyptic writers came to the conclusion that a dis-

tinction must be drawn between the earthly appearance of the Messiah and the appearance of God Himself amongst His people and in the Gentile world for the final judgment.

Nowhere in the discourses of Jesus is there a hint of a limited duration of the Messianic kingdom. The apostolic epistles are equally free from any trace of chiliasm (neither 1 Cor., xv. 23 *seq.* nor 1 Thess., iv. 16 *seq.* points in this direction). In Revelation however, it occurs in the following shape (ch. xx.). After Christ has appeared from heaven in the guise of a warrior, and vanquished the anti-Christian world-power, the wisdom of the world and the devil, those who have remained steadfast in the time of the last catastrophe, and have given up their lives for their faith, shall be raised up, and shall reign with Christ on this earth as a royal priesthood for 1,000 years. At the end of this time Satan is to be let loose again for a short season; he will prepare a new onslaught, but God will miraculously destroy him and his hosts. Then will follow the general resurrection of the dead, the last judgment, and the creation of new heavens and a new earth. That *all* believers will have a share in the first resurrection and in the Messianic kingdom is an idea of which the author of Revelation knows nothing. The earthly kingdom of Christ is reserved for those who have endured the most terrible tribulation, who have withstood the supreme effort of the world-power—that is, for those who are actually members of the church of the last days. The Jewish expectation is thus considerably curtailed, as it is also shorn of its sensual attractions. "Blessed and holy is he that hath part in the first resurrection; on such the second death hath no power; but they shall be priests of God and of Christ, and shall reign with Him a thousand years." Other ancient Christian authors were not so cautious. Accepting the Jewish apocalypses as sacred books of venerable antiquity, they read them eagerly, and transferred their contents bodily to Christianity. Nay more, the Gentile Christians took possession of them, and just in proportion as they were neglected by the Jews—who, after the war of Bar-Cochba, became indifferent to the Messianic hope and hardened themselves once more in devotion to the law—they were naturalized in the Christian communities. The result was that these books became "Christian" documents; it is entirely to Christian, not to Jewish, tradition that we owe their preservation. The Jewish expectations are adopted for example, by Papias, by the writer of the epistle of Barnabas, and also by Justin. That a philosopher like Justin, with a bias towards an Hellenic construction of the Christian religion, should nevertheless have accepted its chiliastic elements is the strongest proof that these enthusiastic expectations were inseparably bound up with the Christian faith down to the middle of the 2nd century.

After the middle of the 2nd century these expectations were gradually thrust into the background. They would never have died out, however, had not circumstances altered, and a new mental attitude been taken up. The spirit of philosophical and theological speculation and of ethical reflection, which began to spread through the Churches, did not know what to make of the old hopes of the future. To a new generation they seemed paltry, earthly and fantastic, and far-seeing men had good reason to regard them as a source of political danger. But more than this, these wild dreams about the glorious kingdom of Christ began to disturb the organization which the Churches had seen fit to introduce. In the interests of self-preservation against the world, the State and the heretics, the Christian communities had formed themselves into compact societies with a definite creed and constitution, and they felt that their existence was threatened by the white heat of religious subjectivity. So early as the year 170, a Church party in Asia Minor—the so-called Alogi—rejected the whole body of the apocalyptic writings and denounced the book of Revelation as a book of fables. All the more powerful was the reaction. In the so-called Montanistic controversy (*c.* 160–220) one of the principal issues involved was the continuance of the chiliastic expectations in the Churches. The Montanists of Asia Minor defended them in their integrity, with one slight modification: they announced that Pepuza, the city of Montanus, would be the site of the New Jerusalem and the millennial kingdom. After the Montanistic controversy chiliastic views were more and more discredited in the Greek Church; they were, in fact, stigmatized as "Jewish" and therefore "heretical." Dionysius, bishop of Alexandria, succeeded in healing the schism and asserting the allegorical interpretation of the prophets as the only legitimate exegesis. During this controversy Dionysius became convinced that the victory of mystical theology over "Jewish" chiliasm would never be secure so long as the book of Revelation passed for an apostolic writing and kept its place among the homologoumena of the canon. He accordingly raised the question of its apostolic origin; and by reviving old difficulties, with ingenious new arguments, he carried his point. The Greek Church kept Revelation out of its canon, and consequently chiliasm remained in its grave. It was considered a sufficient safeguard against the spiritualizing eschatology of Origen and his school to have rescued the main doctrines of the creed and the *regula fidei* (the visible advent of Christ; eternal misery and hell-fire for the wicked). Anything going beyond this was held to be Jewish. In the Semitic churches of the East (the Syrian, Arabian and Ethiopian), and in that of Armenia, the apocalyptic literature was preserved much longer than in the Greek Church. They were very conservative of ancient traditions in general, and hence chiliasm survived amongst them to a later date than in Alexandria or Constantinople.

But the Western Church was also more conservative than the Greek. Her theologians had, to begin with, little turn for mystical speculation; their tendency was rather to reduce the gospel to a system of morals. Now for the moralists chiliasm had a special significance as the one distinguishing feature of the gospel, and the only thing that gave a specifically Christian character to their system. This, however, holds good of the Western theologians only after the middle of the 3rd century. The earlier fathers, Irenaeus, Hippolytus, Tertullian, believed in chiliasm simply because it was a part of the tradition of the Church and because Marcion and the Gnostics would have nothing to do with this conception. It is the same all through the 3rd and 4th centuries with those Latin theologians who escaped the influence of Greek speculation. Commodian, Victorinus Pettavensis, Lactantius and Sulpicius Severus were all pronounced millenarians, holding by the very details of the primitive Christian expectations. As to the canonicity and the apostolic authorship of the Johannine Apocalypse no doubts were ever entertained in the West; indeed an Apocalypse of Peter was still retained in the canon in the 3rd century. That of Ezra, in its Latin translation, must have been all but a canonical book—the numbers of extant manuscripts of the so-called 4 Ezra being incredibly great, while several of them are found in copies of the Latin Bible at the beginning of the 16th century. These facts show how vigorously the early hopes of the future maintained themselves in the West. In the hands of moralistic theologians, like Lactantius, they certainly assume a somewhat grotesque form, but the fact that these men clung to them is the clearest evidence that in the West millennarianism was still a point of "orthodoxy" in the 4th century.

This state of matters, however, gradually disappeared after the end of the 4th century. The change was brought about by two causes—first, Greek theology, which reached the West chiefly through Jerome, Rufinus and Ambrose, and, second, the new idea of the Church wrought out by Augustine on the basis of the altered political situation of the Church. Augustine was the first who ventured to teach that the Catholic Church, in its empirical form, was the kingdom of Christ, that the millennial kingdom had commenced with the appearing of Christ, and was therefore an accomplished fact. By this doctrine of Augustine's, the old millennarianism, though not completely extirpated, was at least banished from the official theology. It still lived on, however, in the lower strata of Christian society; and in certain undercurrents of tradition it was transmitted from century to century. At various periods in the history of the middle ages we encounter sudden outbreaks of millennarianism, sometimes as the tenet of a small sect, sometimes as a far-reaching movement. And, since it had been suppressed, not, as in the East, by mystical speculation, its mightiest antagonist, but by the political

church of the hierarchy, we find that wherever chiliasm appears in the middle ages it makes common cause with all enemies of the secularized Church. It strengthened the hands of Church democracy; it formed an alliance with the pure souls who held up to the Church the ideal of apostolic poverty; it united itself for a time even with mysticism in a common opposition to the supremacy of the Church; nay, it lent the strength of its convictions to the support of States and princes in their efforts to break the political power of the Church. It is sufficient to recall the well-known names of Joachim of Floris, of all the numerous Franciscan spiritualists, of the leading sectaries from the 13th to the 15th century who assailed the papacy and the secularism of the Church—above all, the name of Occam. In these men the millennarianism of the ancient Church came to life again; and in the revolutionary movements of the 15th and 16th centuries—especially in the Anabaptist movements—it appears with all its old uncompromising energy. If the Church, and not the State, was regarded as Babylon, and the pope declared to be the Antichrist, these were legitimate inferences from the ancient traditions and the actual position of the Church.

The German and Swiss reformers also believed that the end of the world was near, but they had different aims in view from those of the Anabaptists. It was not from poverty and apocalypticism that they hoped for a reformation of the Church. In contrast to the fanatics, after a brief hesitation they threw millennarianism overboard, and along with it all other "opiniones Judaicae." They took up the same ground in this respect which the Roman Catholic Church had occupied since the time of Augustine. How millennarianism nevertheless found its way, with the help of apocalyptic mysticism and Anabaptist influences into the Churches of the Reformation, chiefly among the Reformed sects, but afterwards also in the Lutheran Church, how it became incorporated with Pietism, how in more recent times an exceedingly mild type of "academic" chiliasm has been developed from a belief in the verbal inspiration of the Bible, how finally new sects are still springing up here and there with apocalyptic and chiliastic expectations—these are matters which cannot be fully entered upon here.

Bibliography.—Corrodi, *Kritische Geschichte des Chiliasmus* (1781); Bousset, *Religion des Judentums* (1926), and works there quoted; Lohmeyer, *Die Offenbarung des Johannes* (1926). *See* also the Histories of Christian Doctrine and *cf.* Eschatology. (A. Ha.)

MILLER, JOAQUIN (Cincinnatus Heine) (1841–1913), American poet, was born in Indiana, Nov. 10, 1841, and was educated for the law. After some experiences of mining and journalism in Idaho and Oregon, he settled down in 1866 as judge in Grant county, Oregon, and during his four years' tenure of this post he began to write verse. In 1870 he travelled in Europe, and in 1871 he published his first volume of poetry, *Songs of the Sierras,* on which his reputation mainly rests. His *Songs of the Sunlands* (1873) followed in the same vein, and after other volumes had appeared, his *Collected Poems* were published in 1882. He also wrote plays, *The Danites in the Sierras* having some success as a sensational melodrama. On his return from Europe he became a journalist in Washington, but in 1887 returned to California. His pen-name, "Joaquin Miller," by which he is known, was assumed by him when he published his first book, in consequence of his having written an article in defence of Joaquin Murietta, the Mexican brigand. He died at Oakland (Cal.), February 17, 1913. In compliance with his last wishes his body was cremated and the ashes taken up into the Sierras and cast to the winds.

Revised editions of his *Complete Poetical Works* appeared at San Francisco in 1902. Critical estimates and personal reminiscences of him may be found in *The Sunset Magazine,* vol. 30, pp. 765–770 and in *The Overland Monthly,* vol. 63, pp. 109–19; vol. 75, p. 93–96. *See* also H. Wagner, *Joaquin Miller and his Other Self* (1929).

MILLER, JOE (Joseph or Josias) (1684–1738), English actor, first appears in the cast of Sir Robert Howard's *Committee* at Drury Lane in 1709 as Teague. Trinculo in *The Tempest,* the First Grave-digger in *Hamlet* and Marplot in *The Busybody,* were among his many favourite parts. He died on Aug. 16, 1738. After his death, John Mottley (1692–1750) brought out a book called *Joe Miller's Jests, or Wit's Vade Mecum* (1739), a collection of contemporary and ancient coarse witticisms, only three of which are told of Miller. Any time-worn jest has, somewhat unjustly, come to be called "a Joe Miller."

MILLER, OSKAR VON (1855–), German engineer, was born in Munich on May 7, 1855. After studying electrical technology he became director of the German Edison Company from which developed the Allgemeine Elektrizitäts Gesellschaft (the A.E.G., or General Electric Co.). He was director of the electrical exhibition (Frankfurt-on-Main, 1891), when the first high tension alternating current power-transmission apparatus was installed. The transmission was accomplished over a distance of 180 km. (from Lauffen on the Neckar to Frankfurt) and with only 25% loss. These experiments were of the highest importance in the development of modern electric-technology. He promoted the development of Bavarian water power as well as a systematic electric supply for that country, and was the founder and organizer of the German museum for natural and technical science in Munich.

MILLER, WILLIAM (1782–1849), leader of the Second Adventists in America, was born on Feb. 5, 1782, at Pittsfield, Mass. He bore a good reputation as a farmer and citizen, served as a captain in the War of 1812, and was a diligent student and reader, although he had only a common school education. About 1818, after two years of minute study of the Bible, he became a Second Adventist. In 1831 he began to lecture, arguing that the "two thousand three hundred days" of Daniel viii. 14 meant 2,300 years, and that these years began with Ezra's going up to Jerusalem in 457 B.C., and therefore came to an end in 1843, and urging his hearers to make ready for the final coming of Christ in that year. To his many followers, after the year 1843 had passed, he proclaimed that 1844 was the year, that his error was due to following Hebrew instead of Roman chronology, and that Oct. 22 was to be the day. There was renewed excitement among Miller's followers; many of them left their business, and in white muslin robes, on house tops and hills, awaited the epiphany. In spite of disappointment, many still believed with him that the time was near. He returned to Low Hampton and died there on Dec. 20, 1849. The Adventists or Millerites, were formed into a single body in a convention called by him in April 1845, but have since separated into four sects: Seventh Day Adventists (110,998), Advent Christians (29,410), Churches of God in Jesus Christ (1,686) and the Life and Advent Union (535). Their total membership in the United States in 1926 was about 146,177. Miller published in 1833 a pamphlet which was the basis of his lectures; these also were published in 1842 as *Evidence from Scripture and History of the Second Coming of Christ about the Year 1843.*

There are biographies by Sylvester Bliss (1853) and James White (1875).

MILLER, WILLIAM (1795–1861), British soldier, who took a prominent part in the South American Wars of Liberation, was born on Dec. 2, 1795 at Wingham, Kent, entered the British artillery service in 1811, and till 1814 served with Wellington's army in the Peninsula. He afterwards served in North America, then travelled for two years in Europe, and went to South America. The war which culminated in the expulsion of the Spaniards was just breaking out, and he took command in the Chilean artillery. As a major he commanded the marines on Cochrane's vessel, the "O'Higgins." In 1821 he landed in Peru, to assist General San Martin, and as general of brigade, rendered conspicuous services at Junin (Aug. 6, 1824), and at Ayacucho (Dec. 9, 1824). He subsequently filled various high military and political offices in Peru. In 1839 he was involved in the fall of Santa Cruz, and went into exile. For some years he filled the post of British Consul-General of the Pacific Coast. He died on board H.M.S. "Naiad" at Callao, on Oct. 31, 1861.

See the *Memoirs* published by his brother John Miller (1827).

MILLER, WILLIAM (1796–1882), Scottish line-engraver, was born in Edinburgh on May 28, 1796. After studying in London under George Cook, a pupil of Basire's, he returned to Edinburgh. He executed plates after Thomson of Duddingston, Mac-

culloch, D. O Hill, Sir George Harvey, and other Scottish landscapists, but his chief works were his transcripts from Turner. He engraved Turner's "The Grand Canal, Venice"; "The Rhine, Osterprey and Feltzen"; "The Bell Rock"; "The Tower of London"; and "The Shepherd." The art of William Miller was warmly appreciated by Turner himself, and Ruskin pronounced him to be on the whole the most successful translator into line of the paintings of the greatest English landscapist. In his later years Miller abandoned engraving for landscape-painting. He resumed his burin, however, to produce two final series of vignettes from drawings by Birket Foster illustrative of Hood's *Poems*, published by Moxon in 1871. Miller died on Jan. 20, 1882.

MILLERAND, ALEXANDRE (1859–), French Socialist and politician, was born in Paris on Feb. 10, 1859. He was educated for the bar, and made his reputation by his defence, with Georges Laguerre, of Ernest Roche and Duc-Quercy, the instigators of the strike at Decazeville in 1883; he then took Laguerre's place on Clemenceau's paper, *La Justice*. He was elected to the chamber of deputies for the department of the Seine in 1885 as a Radical Socialist. He was associated with Clemenceau and Camille Pelletan as an arbitrator in the Carmaux strike (1892). He had long had the ear of the chamber in matters of social legislation, and after the Panama scandals had discredited so many politicians his influence grew. He was chief of the Socialist left, which then mustered sixty members, and edited until 1896 their organ in the press, *La Petite République*. His programme included the collective ownership of the means of production and the international association of labour, but when in June 1899 he entered Waldeck-Rousseau's cabinet of "republican defence" as minister of commerce he limited himself to practical reforms, devoting his attention to the improvement of the mercantile marine, to the development of trade, of technical education, of the postal system, and to the amelioration of the conditions of labour.

Labour questions were entrusted to a separate department, the Direction du Travail, and the pension and insurance office was also raised to the status of a "direction." The introduction of trades-union representatives on the Supreme Labour Council, the organization of local labour councils and the instructions to factory inspectors to put themselves in communication with the councils of the trades-unions, were valuable concessions to labour, and he further secured the rigorous application of earlier laws devised for the protection of the working-classes. His name was especially associated with a project for the establishment of old age pensions, which became law in 1905. He became in 1898 editor of *La Lanterne*. His influence with the extreme Socialists had already declined, for it was said that his departure from the true Marxist tradition had disintegrated the party.

Millerand, now only a private member, threw himself into his work as a barrister, and appeared in many important civil cases. In the chamber he was a fierce opponent of the Combes ministry, which succeeded that of Waldeck-Rousseau; for he objected to its narrow and fanatical anti-clericalism. In July 1909 he became minister of public works in Briand's first cabinet, his principal achievement at this time being the re-organisation of the state railways. Together with Briand he took strong measures to suppress the railway strike of October 1910. In January 1912 he was appointed minister of war under Poincaré. His promotion surprised no one, for he had always taken a keen interest in questions of military organisation; and when the menace of Germany increased, he devoted himself to strengthening the national defences. He re-organised the higher command, and by the Act of May 29, 1912, he gave a definite status to military aeronautics for the first time. In January 1913 a personal incident brought about his retirement. On Aug. 25, 1914, he was invited by Viviani to take the place of Messimy as minister of war; and during the terrible situation which then prevailed he had constantly to take the initiative, for example, in attempting to remedy as far as possible the shortage of munitions. He was accused, however, of being too slow in providing the necessary heavy artillery, and he resigned with the other members of the Viviani cabinet at the end of October 1915. In 1918 he was elected a member of the Académie des sciences morales et politiques.

A few months after the conclusion of hostilities, on March 21, 1919, Millerand was appointed commissioner general for Alsace-Lorraine. The problem of reuniting with the mother-country two provinces which had been torn from her in 1871 was a most serious one. For 50 years they had been under an administration widely different from that of France. A period of transition, therefore, was essential, alike from the point of view of political expediency, administration, economics and finance. The first French officials sent to Strasbourg had not been equal to their task; and for this reason it was essential to appoint a statesman of eminent authority with power to act, who would keep in constant touch with the government. This post was filled by Millerand with complete success. In an important speech delivered in Paris on Nov. 15, 1919, on the eve of the elections, he outlined the policy of the coalition which, under the name of the *bloc national*, was returned to power.

On the resignation of Clemenceau, Jan. 18, 1920, Millerand was chosen to form a cabinet, and became both prime minister and minister for foreign affairs. His main activities were in regard to the application of the Treaty of Versailles; and in order to force Germany to fulfil her obligations, he ordered the provisional occupation of Frankfort. He was present at the inter-allied conferences at San Remo and Spa, in April and July 1920, and in August of the same year he met Lloyd George at Hythe. The situation in regard to Poland, who had been attacked by the Bolsheviks, now became grave, and Millerand therefore sent to Warsaw a contingent of French officers under General Weygand. With this assistance the Poles gained a complete victory over the Bolsheviks. Millerand about this time officially recognised the anti-Bolshevik government of General Wrangel, who was soon after completely defeated. In France itself, in May 1920, he frustrated various attempts, especially by the railwaymen, to organise revolutionary strikes.

In September 1920 Deschanel, president of the republic, was forced by ill-health to resign. Millerand was elected as his successor, and out of 892 votes cast, no fewer than 695 were given in his favour. During his candidature, he made it known that if he were elected, he intended to exert a more powerful influence on the policy of the government than his predecessors had done. He refused to admit that his office of president forced him to comply with a tradition of which he disapproved, by remaining absolutely neutral in politics. He made it clear that he intended to watch closely the foreign policy of the government, and made no secret of his wish to strengthen the power of the president by a revision of the constitution which would modify the conditions of his election; and he put his ideas into practice, by frequently intervening in diplomatic negotiations. During the inter-allied conference at Cannes in January 1922 he despatched a telegram expressing dissatisfaction at the conduct of affairs, which caused Briand to return to Paris, and, in fact, brought about his resignation. Working on the same lines, he summoned to the *Elysée* the prefects, or chief administrative officers of each department from all over France. In a powerful speech at Evreux in the spring of 1923 he declared that he would not agree to the re-introduction of the *scrutin d'arrondissement*, and showed marked favour to the adherents of the *bloc national*, who had been in the majority in the Chamber since the elections of November 1919, and against whom the Radicals and Socialists were then carrying on a campaign of public meetings.

Millerand's conception of the rôle of president of the Republic brought him into collision with the Radical and Socialist majority, which, under the name of the *cartel des gauches*, was successful in the elections of May 11, 1924. He was violently attacked by the Radical Socialist press, which accused him of having exceeded his powers by intervening in the party struggle, and called for his resignation. Herriot, the leader of the *cartel des gauches*, when asked by Millerand to succeed Poincaré as premier, announced that he would do so only on Millerand's resignation. The latter replied that he had been elected for seven years, and that the alteration of the party in power could in no way affect his consti-

tutional position nor abrogate his rights. But he made it clear that he had not the slightest intention of obstructing the new government, and that its leader could count on his impartiality.

Herriot, however, remained immovable; and Millerand therefore invited the senator François-Marsal, who had been his minister of finance in 1920, to form a cabinet. François-Marsal declared in the Chamber that the attacks on Millerand were contrary to the constitution, and that it was in order to uphold the latter that he had agreed to take office. His government, however, was immediately defeated; and Millerand tendered his resignation, protesting meanwhile against the illegality of the action taken against him. The attitude of the party in power dissatisfied the Senate, which, as a result, voted with the opposition and elected Doumergue as Millerand's successor, instead of Painlevé, the candidate of the *cartel des gauches.*

In January 1927, at the senatorial elections in the department of the Seine, Millerand was defeated. Several months later he stood for a by-election in the department of the Orne, in Normandy. He was elected and resumed his place in the Senate.

MILLERITE, a mineral consisting of nickel sulphide, NiS. Crystals belong to the rhombohedral system and have the form of slender needles arranged in divergent groups or of delicate fibres loosely matted together ("hair-pyrites"). The colour is brass-yellow and the lustre metallic. Typical specimens of millerite, so named, in 1845, in honour of W. H. Miller, are found in the coal-measures in the neighbourhood of Merthyr Tydvil, where the delicate needles and fibres occur with crystals of quartz and pearl-spar in the fissures of septarian nodules of clay-ironstone.

MILLER'S THUMB, a small fish, abundant in all rivers and lakes of northern and central Europe with clear water and gravelly bottom, up to 7,000 feet. It has a broad, flat head, rounded and scaleless body, large pectoral and narrow ventral fins, with two dorsal fins; the gill-cover is armed with a spine. The numerous species of the genus are confined to the north temperate zone, the majority being marine and called "bullheads." The miller's thumb is confined to fresh water; one other freshwater species is found in Europe, others occur in the fresh waters of northern Asia and North America. The miller's thumb (*Cottus gobio*) is common in all suitable localities in Great Britain, but rare in Ireland. Its usual length is from 3 to 5 inches. Its prey consists of small aquatic animals, upon which it pounces from some refuge. The female deposits her eggs in a cavity under a stone, whilst the male watches and defends them until the young are hatched. The common American bullhead is the *sculpin* (a name sometimes applied to all the New World members of the genus), *C. octodecim-spinosus,* which is marine.

MILLET, FRANCIS DAVIS (1846–1912), American artist, was born at Mattapoisett (Mass.), on Nov. 3, 1846. He was a drummer boy with the Union forces in the Civil War, graduated from Harvard college in 1869, and in 1871 entered the Royal Academy of Fine Arts, Antwerp. In 1873 he was made secretary of the Massachusetts commission to the Vienna exposition. During the Russo-Turkish War of 1877-78 he was correspondent of the London *Daily News* and *Graphic,* and of the New York *Herald.* On his return he was made a member from the United States of the International art jury at the Paris exposition of 1878. He was director of decorations at the Columbian exposition, Chicago, 1893, and in 1898 he went to Manila as war correspondent for *The Times* and for *Harper's Weekly.* In 1880 he became a member of the Society of American artists, and in 1885 was elected to full membership in the National academy of design, New York, and was for one term its vice-president. He was a trustee of the Metropolitan Museum of Art, secretary of the American academy of Rome and vice-chairman of the Fine Arts committee. He was also a member of the American water colour society and of the Institute of painters in oil colours, London. His work as a decorative artist may be seen at Trinity church, Boston; the Bank of Pittsburgh; and the capitol at St. Paul (Minn.). His pictures are in many public collections: among them are "A Cosy Corner," in the Metropolitan Museum of Art, New York; "At the Inn," in the Union League club, New York; and "Between Two Fires," in the Tate Gallery, London. He also wrote essays and short stories, and an English version of Tolstoi's *Sebastopol* (1887); and among his publications are *The Danube* (1891), *Capillary Crime and other Stories* (1892), and *Expedition to the Philippines* (1899). He was drowned in the "Titanic" disaster, April 15, 1912.

MILLET (or MILÉ), **JEAN FRANÇOIS** (*c.* 1642–1679), commonly called FRANCISQUE, was born at Antwerp about 1642, and is generally classed amongst the painters of Flanders on account of the accident of his birth. But his father was a Frenchman, a turner in ivory of Dijon, who took service with the prince of Condé and probably returned after a time to his native country. He remained long enough in Antwerp to apprentice his son to an obscure member of a painter family called Laurent, pupil of Gabriel Franck. With Laurent, Francisque left Antwerp for Paris, and there settled in 1660 after marrying his master's daughter. He was received a member of the Academy of Painting at Paris in 1673, and after gaining consideration as an imitator of the Poussins he died in 1679, bequeathing his art and some of his talents to one of his sons. His paintings of Italian and Arcadian scenery were graceful and effective, although, as he had not travelled, his impressions of them were gained at secondhand. Twelve of his most important landscapes in the Tuileries were destroyed by fire; and though many of his pieces may still be found catalogued in Continental and English collections, a great number remain unknown and unacknowledged.

MILLET, JEAN FRANÇOIS (1814–1875), French painter, who came of a peasant family, was born on Oct. 4, 1814 in the hamlet of Gruchy, near Gréville (La Manche). His boyhood was passed working in his father's fields, but the sight of the engravings in an old illustrated Bible set him drawing. Two drawings were shown to a painter at Cherbourg named Mouchel, who at once accepted him as a pupil; but shortly after (1835) Millet's father died, and the eldest son, with heroic devotion, took his place at home, nor did he return to his art until encouraged by his own family. After a short time spent at Cherbourg under a master named Langlois he started for Paris. The council-general of the department had granted him a sum of 600 francs, and the town council promised an annual pension of 400, but in spite of friendly help and introductions Millet experienced great difficulties. The system of the École des Beaux Arts was hateful to him, but after much hesitation, he decided to enter an official studio—that of Delaroche. The master recognized his ability, and arranged for his free admission to the studio, but he tried in vain to make him take the approved direction, and lessons ended with "Eh, bien, allez à votre guise, vous êtes si nouveau pour moi que je ne veux rien vous dire." At last Millet withdrew, and with his friend Marolle started in a little studio in the Rue de l'Est. He continued to study hard whilst he provided bread by painting portraits at 10 or 15 francs apiece and producing small "pastiches" of Watteau and Boucher. In 1840 Millet went back to Gréville, where he painted "Sailors Mending a Sail" and a few other pictures of Cherbourg life.

His first success was obtained in 1844, when his "Milkwoman" and "Lesson in Riding" (pastel) attracted notice at the Salon, and friendly artists presented themselves at his lodgings only to learn that his wife had just died, and that he himself had disappeared. Millet was at Cherbourg; there he remarried, but having amassed a few hundred francs he went back to Paris and presented his "St. Jerome" at the Salon of 1845. This picture was rejected and exists no longer, for Millet, short of canvas, painted over it "Oedipus Unbound," a work which during the following year was the object of violent criticism. He was, however, no longer alone; Diaz, Eugène Tourneux, Rousseau, and other men of note supported him by their confidence and friendship, and his second wife, Catherine Lemaire, bore poverty with dignity and gave courage to her husband. To this date belong Millet's "Golden Age," "Bird Nesters," "Young Girl and Lamb," and "Bathers"; to the "Bathers" (Louvre) succeeded "The Mother Asking Alms," "The Workman's Monday," and "The Winnower."

This last work, exhibited in 1848, was highly praised, but remained unsold until Ledru Rollin, informed of the painter's dis-

tress, gave him 500 francs for it. Rollin also gave Millet a commission which enabled him to leave Paris for Barbizon, on the skirts of the forest of Fontainebleau. There he settled in a three-roomed cottage for the rest of his life—twenty-seven years, in which he wrought out the perfect story of that peasant life of which he alone has given a "complete impression." Jules Breton has coloured the days of toil with sentiment; others, like Courbet, whose eccentric "Funeral at Ornans" attracted more notice at the Salon of 1850 than Millet's "Sowers and Binders," have treated similar subjects as a vehicle for protest against social misery; Millet alone, a peasant and a miserable one himself, saw true, neither softening nor exaggerating what he saw. To a friend he expressed his resolve to break with mythological subjects. In 1852 he produced "Girls Sewing," "Man Spreading Manure"; 1853, "The Reapers"; 1854, "Church at Gréville"; 1855—the year of the International Exhibition, at which he received a medal of second class—"Peasant Grafting a Tree"; 1857, "The Gleaners"; 1859, "The Angelus," "The Woodcutter and Death"; 1860, "Sheep Shearing"; 1861, "Woman Shearing Sheep," "Woman Feeding Child"; 1862, "Potato Planters," "Winter and the Crows"; 1863, "Man with Hoe," "Woman Carding"; 1864, "Shepherds and Flock," "Peasants Bring Home a Calf Born in the Fields"; 1869, "Knitting Lesson"; 1870, "Buttermaking"; 1871, "November—recollection of Gruchy."

Something of the imposing unity of his work was, no doubt, due to an extraordinary power of memory, which enabled Millet to paint without a model; he could recall with precision the attitudes or gestures which he proposed to represent. Thus he could count on presenting free from afterthoughts the vivid impressions which he had first received. Those impressions were always of a serious and often of a noble order, to which the character of his execution responded so perfectly that even a "Washerwoman at her Tub" will show the grand action of a Medea. The drawing of this subject is reproduced in *Souvenirs de Barbizon*, a pamphlet in which M. Piédagnel has recorded a visit paid to Millet in 1864. His circumstances were then less evil, after struggles as severe as those endured in Paris. A contract by which he bound himself in 1860 to give up all his work for three years had placed him in possession of 1,000 francs a month. His fame extended, and at the exhibition of 1867 he received a medal of the first class, and the ribbon of the Legion of Honour. He died on Jan. 20, 1875. He was buried by his friend Rousseau's side in the churchyard of Chailly.

MILLET, a name applied to a number of very different species of cereals and grasses belonging to distinct genera and even subfamilies of the Gramineae (grasses). They are grown in Europe and the United States as forage and in Asia and Africa as food crops. The four genera, *Chaetochloa* (*Setaria*), *Echinochloa*, *Panicum*, and *Pennisetum*, belonging to the tribe Paniceae, include most of the millets, though *Eleusine coracana* (ragi or finger millet grown in India) falls in the tribe Chlorideae. A key, following Frear and Robbins, is given below to the principal millets of economic importance and to some of the closely related weed grasses.

Inflorescence paniculate; no involucre below the individual spikelets.
- Inflorescence a raceme of short spikes; empty glumes awned or awn-pointed, *Echinochloa* (Barnyard millets and wild barnyard grass).
  - Awns long; spikelets white, *E. crusgalli* (common barnyard grass).
  - Awns short; spikelets brown, *E. frumentacea* (Japanese barnyard millet).
- Inflorescence a drooping panicle; empty glumes not awned, *Panicum miliaceum* (proso or broom-corn millet).

Inflorescence spicate; involucre of bristles below each spikelet.
- Grain enclosed in lemma and palet (the hull) at maturity; spike loose, *Chaetochloa* (foxtail millet and foxtail grass).
  - Panicle usually 1 centimetre thick or less; bristles commonly green; spikelets about 2 millimetres long, *C. viridis* (green foxtail).
  - Panicle usually 1 to 3 centimetres thick; bristles usually purple; spikelets, 2·5 to 3 millimetres long, *C. italica* (foxtail millets).
- Grain globose, forcing open the hull as it matures, and falling free when threshed; spike dense, *Pennisetum glaucum* (pearl millet).

Common millet (also called Indian millet, proso, hog-millet, broom-corn millet) is *Panicum miliaceum*. Its origin is unknown, but it is probably a native of Egypt and Arabia. It has been cultivated in Egypt, Asia and southern Europe since prehistoric times. It is a small erect annual, reaching a height of 3–3½ ft. and possesses bristly, much branched nodding panicles. Cross-pollination regularly occurs. The grain is about 3 mm. long by 2 mm. broad, the kernel being firmly surrounded by the shining, hard, flowering glume and palea. (*See* GRASSES.) Three varieties are often recognised: Vars. *effusum*, *contractum* and *compactum*. The plant ripens as far north as southern Germany; in fact, wherever the vine can be grown for wine production. The grain, which is very nutritious, is used in the form of groats and makes excellent bread when mixed with wheat flour. It is also largely used for feeding poultry.

BY COURTESY OF THE DEPT. OF AGRICULTURE

TURKISTAN OR ITALIAN MILLET, (SETARIA ITALICA), WHICH IS CULTIVATED AS A CEREAL IN ASIA

Chaetochloa italica or *Setaria italica* includes many varieties known as foxtail millets, Turkistan millet, German millet, Hungarian millet or grass, etc., is a native of Asia and is extensively grown in India. The grains are smaller than those of the common millet but it is exceedingly prolific, the total yield being many times that of wheat. The grains are used locally for human food and imported into Great Britain for poultry feeding.

Pearl millet (*Pennisetum glaucum* or *P. typhoideum*) is extensively cultivated in tropical Asia, Egypt and India. Its origin is unknown but it has come probably from tropical Africa.

Echinochloa (*Panicum*) *crusgalli* is the barnyard grass or millet of the United States and *E. frumentacea* (*Panicum frumentaceum*) may be a variety of *E. crusgalli;* it is the Japanese barnyard millet or Deccan grass. *E. maximum* is the Guinea grass, a native of tropical Africa; it grows 8 ft. high and yields a nutritious grain. Other gigantic species form the field crops on the banks of the Amazon.

E. (*P.*) *decompositum* is the Australian millet the grains of which are used by the natives. *Paspalum scrobiculatum* is the Kodo millet cultivated in India, while *Milium effusum* is the millet grass. (*See* also DURRA and SORGHUM.)

For further details *see* C. R. Ball, "Pearl Millet," *U.S. Dept. Agric. Farmers' Bull. 168I* (1903); G. Watt, *Dictionary of the Economic Products of India* (London, 1908); M. A. Carleton, *The Small Grains* (New York and London, 1916); W. Robbins, *Botany of Crop Plants* (Philadelphia, 1924). (V. H. B.)

MILLIKAN, ROBERT ANDREWS (1868–), American physicist, was born at Morrison, Ill., March 22, 1868, and received his education at Oberlin College (A.B., 1891; A.M., 1893) where he was instructor in physics 1891–93. He then proceeded to Columbia University (Ph.D., 1895), and the universities of Berlin and Göttingen (1895–96). In 1896 he was appointed assistant in physics at the University of Chicago, with which institution he continued to be associated for the next 25 years in the department of physics, being professor from 1910 to 1921. In 1921 he became director of the Norman Bridge laboratory of physics and chairman of the executive council of the California

Institute of Technology at Pasadena, California. He was vice-chairman of the National Research Council, Washington, D.C., in 1917, and chief of the science and research division of the Signal Corps, U.S.A., with the rank of lieutenant-colonel. In 1922 he was the first exchange lecturer to Belgium on the C.R.B. Foundation.

The best known of his researches were the "oil drop" experiments, undertaken with the view of making measurements of fundamental electrical quantity. They proved conclusively that all electrons are alike, and yielded the most accurate determination of the electron thus far made. He also undertook researches into photoelectric effect. Later research of his has tended definitely to bridge the gap between light and X-ray phenomena and to yield new information on the radiating properties of light atoms. He has recently brought new precision to the study of cosmic rays. He was awarded the Nobel Prize in physics in 1923 for his work in isolating and measuring the electron, and in making the first exact photoelectric determination of the light-quant. He received the Edison Medal for especially meritorious work in the field of electricity, and the Hughes Medal of the Royal Society in recognition of his determination of the electronic charge and other physical constants. He is also the recipient of the Faraday medal and the Matteuci medal. (*See* also PHYSICS and ELECTRICITY, ATMOSPHERIC: *Cosmos Radiation.*)

Millikan was the author of the following, among other works:—*Mechanics, Molecular Physics and Heat* (1901); *Electricity, Sound and Light* (1908); *The Electron* (1917); *Practical Physics* (1920); *Science and Life* (1923); *Science and the New Civilization* (1930), in addition to numerous contributions to technical periodicals.

MILLING: *see* FLOUR AND FLOUR MANUFACTURE.

MILLING-CUTTERS are revolving tools which cut all shapes in metal by continuous action and not by the reciprocating movement used in planing, shaping or slotting. (*See* MACHINE TOOLS.)

MILLING MACHINES are a highly important class of machine tool which will perform almost all the operations necessary in metal-cutting, by means of revolving cutters past which the work is fed. Milling was first done in the lathe, the cutter being rotated between the centres, while the slide traversed the piece of metal across and beneath it. There are still many milling machines, termed Lincoln millers, in which the resemblance to the lathe is evident, and which were developed at an early period to mill parts of small arms and sewing machines, when the interchangeable system of manufacture began.

The great advantage of the milling machine is that cutters can be made for all sorts of shapes, to mill corresponding profiles, which they will do on tens of thousands of pieces alike. Hand production by files is thus eliminated and great accuracy ensured. Cutters can also be multiplied, several being used on one spindle, so that a complicated surface or a number of duplicate pieces may be milled at one pass. Machines with multiple spindles, each carrying a cutter or a set will surface off very complex shapes of castings, *e.g.*, castings for parts of engines and machinery, etc., thereby saving a lot of piecemeal cutting which would otherwise be necessary to finish the outlines. There is a system termed *profile milling*, by means of which a cutter will produce curves and flats, the work being coerced during the traverse by a copy of like shape. The constantly-changing curves of cams are also milled by a similar device. Screw-threads and worms are cut by a milling cutter of suitable shape, revolved and fed laterally whilst the screw rotates.

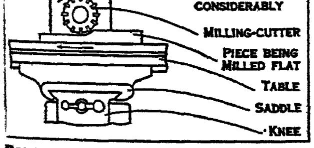

DIAGRAM SHOWING THE ELEMENTS OF A MILLING MACHINE

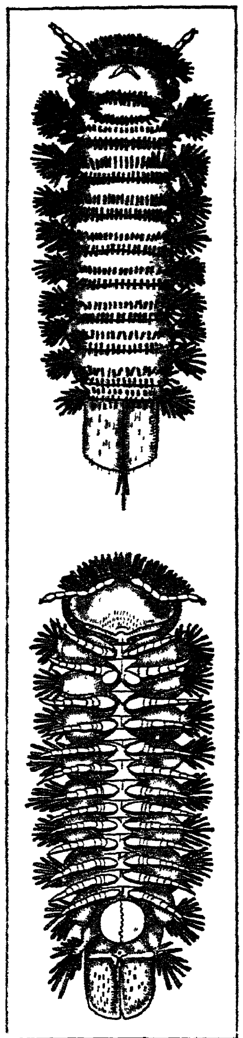
The Lincoln machine mentioned is built in small and in large sizes for what is termed *manufacturing*, that is the milling of large numbers of similar shapes for small arms, machine-guns, sewing machines, cycles, parts of cars, etc. Its constructional features are relatively simple, and the pieces of work are either gripped in a vice, or in a special clamping unit, termed a fixture, which automatically gives the correct attitude in relation to the cutter. Often several articles are clamped in line for the cutter to mill them in succession, so that at one traverse of the table three or four or more receive treatment.

When a varied range of milling has to be performed, this model is not sufficiently adaptable, and what is termed a plain or a universal machine is chosen. This has a column near the top of which a horizontal spindle is driven by belt or motor, and usually a change-speed gearing to obtain the various speeds. A triangular-shaped knee is adjustable up and down, slideways on the face of the column, and across the flat face at the top of the knee a saddle is adjustable. This saddle, in turn, carries the long sliding table for the objects to be milled. The operator has thus the choice of three adjustments with which he can bring all sorts of castings and forgings into correct position for milling, and then feed them by hand or automatically. Some cutters, termed end mills, cut mainly by their ends and effect surfacing and the milling of slots and grooves. By putting a pair of index centres, *i.e.*, a couple of heads with point centres between which work can be swung, on the table circular dividing may be effected. This action enables flats, squares, hexagons, etc., to be finished, or slots cut around a cylinder or disc. Gearwheel teeth are also made in the same manner. The difference between a plain and a universal miller is that the latter has a swivel-mounting for the table, so that it may be slewed at a suitable angle, and spiral grooves be cut, or the helically set teeth of milling-cutters or gears be produced, as well as screws and worms that may be required.



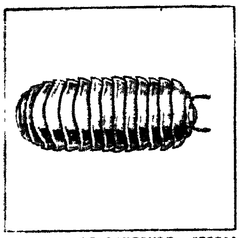
FROM VERHOEFF, "DIPLOPODA"
FIG. 1.—POLYXENUS LAGURUS, BACK AND FRONT VIEWS. SEE MILLIPEDE

Plano-millers.—Castings too large for the foregoing types of machines receive treatment on the *plano-millers*, big affairs like planing machines in general outline, but with one or more cutter-spindles on the cross-rail, and sometimes others attacking from the sides. The long table feeds the pieces under the cross-rail, or a gang of pieces is clamped to the table for milling at a single travel. Motor car cylinders are milled in batches on these machines, as well as many other portions of engines and machines. Or long frames or rods, such as printing machinery frames, locomotive connecting or coupling rods, etc., are passed under the cutters. Very large castings, such as cylinders, beds, turbine casings, condenser bodies, and big machine framings are too big for any plano-miller, but the milling is performed with a combined drilling, boring and milling machine or a portable milling machine is brought into position and attached to the object upon which it is intended to do the work.

Vertical-spindle milling machines handle a varied range of cutting by means of the end mills previously mentioned, or of cylindrical mills cutting on the periphery, for edges and sides. The profiling of contours which cannot be milled by the linear movements of the slides is effected by controlling the slides through the medium of a copy of the shape desired. Somewhat recent developments of the vertical-spindle designs are the *continuous* millers; a revolving circular table holds a set of work-holding fixtures so that each in turn passes the cutter. The attendant can remove the finished specimen from the fixture farthest from the cutter and put in a fresh one for milling, so that no stop need occur in the running. *Station* milling is another highly productive method; the rotary table feeds straight in towards the cutter; then it reverses, and makes a portion of a revolution,

bringing another piece into line for the feed. The operator is able to remove finished components and to re-load the fixture that is furthest away from the cutter. Still higher rate of production is practicable in the *drum continuous* machines which have a set of fixtures spaced around a big horizontally set cylinder, and cutters attacking from each end of the work.

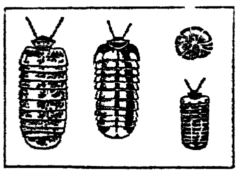
The principal difficulties in milling are connected with the results of vibration, which leaves a bad finish, and with the quantity of chips produced. The first difficulty is remedied chiefly by strong construction of the machine; the second by effective lubrication with a heavy volume of oil, which washes the chips rapidly away from the machine. (F. H.)



FROM H. DE SAUSSURE, "ESSAI D UNE FAUNE DES MYRIAPODES DU MEXIQUE"
FIG. 2.—GLOMERIDESMUS MEXICANUS

MILLIPEDE, an animal with a distinct head, one pair of feelers (antennae) and a segmented body not divided up into regions like that of most arthropods. Each typical segment of the body is provided with two pairs of walking legs (fig. 5). The millipedes form in the phylum Arthropoda the distinct class Diplopoda.

Millipedes have a world-wide distribution, and were among the earliest creatures to emerge from the water, for fossil Diplopoda are known in considerable numbers from the Devonian and some remains (*Archidesmus loganensis*) have been found in Scotland even in the Upper Silurian. By Carboniferous times millipedes were well established and are represented by a great array of specimens obtained in the United States, Great Britain and Bohemia. Early millipedes were remarkably like living forms. Some Carboniferous forms were probably amphibious (fig. 8).

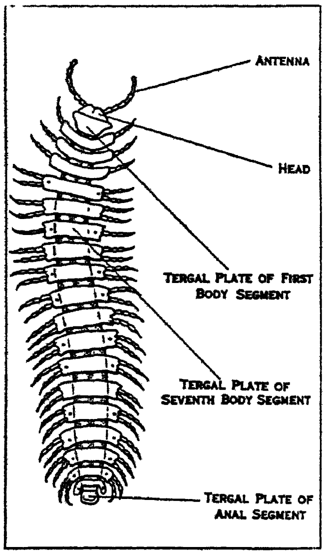


FROM BRONN, "KLASSEN UND ORDNUNGEN DES TIERREICHS"
FIG. 3.—GLOMERIS (THE PILL-MILLIPEDE)

The nesting habits of some millipedes are most interesting and somewhat complicated. In *Polydesmus* the female selects a suitable site on a fragment of wood or a similar object in a damp spot and builds a circular wall by the discharge of faeces, which are moulded by the anal valves; this process is carried on until the beehive-like nest is well advanced and then the eggs are deposited and the nest is roofed in. The female remains coiled around the nest for some time after the structure is complete (fig. 9).

Skin-changing is a serious danger to the life of a millipede because it leaves the animal in an unusually defenceless condition; for this reason the animal goes into retirement when the process is imminent, and in some cases, as in *Glomeris* and *Oxydesmus*, a special changing-cell like a nest is constructed.

For some unexplained reason millipedes occasionally move in large numbers, sometimes even in broad daylight. On one occasion in Alsace a train was stopped because the dead and crushed bodies of the migrating diplopods made the rails slippery.



FROM R. I. POCOCK, "ZOOLOGISCHE ERGEBNISSE" (E. J. BRILL)
FIG. 4.—PLATYRHACUS MIRANDUS, A SUMATRAN SPECIES OF POLYDESMIDAE, SHOWING THE FORM CHARACTERISTIC OF THE ORDER POLYDESMOIDEA

Some millipedes injure crops, but their masticatory organs are weak and they can only damage delicate tissues such as young roots or internal structures exposed by the attacks of other pests; others eat any decaying tissues.

Classification.—Millipedes were known to Aristotle but were little studied till the time of Linnaeus. The class may be subdivided, according to Attems, as follows:—

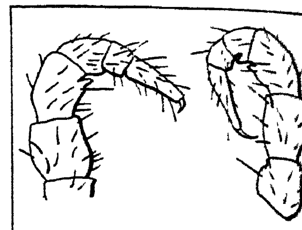
A. SUB-CLASS PSELAPHOGNATHA. Soft-bodied millipedes with rows and tufts of bristles. Example: *Polyxenus.*

B. SUB-CLASS CHILOGNATHA. Integument strengthened by deposition of salts of lime. Hairs, when present, occur singly, not in tufts. Sexually modified limbs in the male on the 7th segment or at the hind end of the body.

1. *Opisthandria.* Male has sexually modified limbs (one or two pairs) at the hinder end of the body.

Order *Limacomorpha.* Body with 22 segments. Body cannot roll into a ball. Example: *Glomeridesmus* (fig. 2).

Order *Oniscomorpha.* Body with 14–16 segments. Body will roll into a ball. Example: *Glomeris* (fig. 3).



FROM BRADE-BIRKS
FIG. 5.—BRACHYCHAETEUMA. WALKING LEGS

2. *Proterandria.* Sexually modified limbs on the 7th segment in the male.

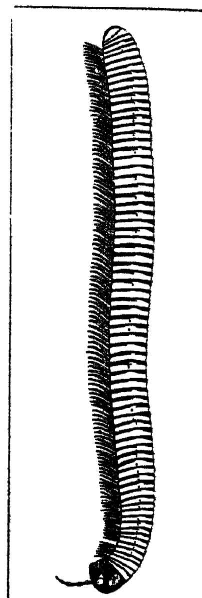
Superorder Eugnatha. Not more than seven pairs of walking legs in front of the sexually modified limbs of the 7th segment.

Order *Polydesmoidea.* 19 to 22 body segments. The first pair of limbs of the 7th segment modified in the male, the second pair is a normal pair of walking legs. Examples: *Polydesmus, Platyrhacus* (fig. 4).

Order *Nemato-phora.* 26 or more body segments. One or both pairs of limbs of the 7th segment modified in the male. Silk glands present. Example: *Brachychaeteuma.*

Order *Juliformia.* More than 40 cylindrical body segments. No walking legs on the 7th segment of male. No silk glands. Examples: *Iulus, Blaniulus, Spirostreptus* (fig. 6).

Superorder Colobognatha. 8 pairs of walking legs in front of the sexually modified legs of the male. Example: *Polyzonium* (Head in fig. 7).

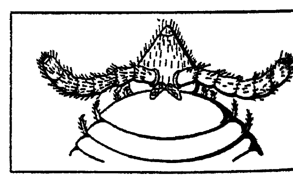


FROM BRONN, "KLASSEN UND ORDNUNGEN DES TIERREICHS"
FIG. 6.—A TYPICAL MEMBER OF THE ORDER JULIFORMIA

Structure.—The head bears one pair of antennae and the masticatory apparatus which consists of a pair of mandibles and a pair of fused appendages modified to form a single plate-like structure, the gnathochilarium.

In most millipedes paired simple eyes (ocelli) occur singly or grouped, but some are blind. Most millipedes are provided at the sides of the head with a sense-organ (organ of Tömösvary) of unknown function.

In the Pselaphognatha the integument remains soft but in other millipedes the cuticle is strengthened by the deposition of lime salts within its substance except in places where flexibility is necessary for movement. The roof and side-walls of the typical trunk segment are fused together to form a single pleurotergite almost encircling the body, the floor being formed by two small plates, the sternites, placed one in front of the other. Associated with each sternite is a pair of walking legs. More fusion, or less, accounts for differences in this arrangement in different millipedes. In many there is in addition one pair of protective "stink glands" opening on each pleurotergite. The digestive tube, heart, main nerve cord and breathing apparatus (tracheae) are in general like those of the centipede (*q.v.*). The reproductive system lies below the gut and opens in the third body segment.



FROM VERHOEFF, "DIPLOPODA"
FIG. 7.—HEAD OF POLYZONIUM

The origin of the double segment in diplopods is obscure but an additional pair of masticatory appendages just behind the mandibles has been found in the embryo of *Spirostreptus.* The young are hatched from the egg with three pairs of walking-legs.

BIBLIOGRAPHY.—The literature in English and French is very scattered. The best modern accounts are in German: Carl Attems, "Diplopoda" in *Handbuch der Zoologie,* vol. iv. (1926); K. W. Verhoeff, "Diplopoda." which includes an account of fossil forms, in Bronn's *Klassen und Ordnungen des Tier-Reichs,* vol. v. (Leipzig, 1926–27); K. W. Verhoeff, *Die Diplopoden Deutschlands* (Leipzig 1910–14). On economic status, *see* S. G. Brade-Birks, Supplement to *Lancashire and Cheshire Naturalist* (Dec. 1923).

FIG. 8.—ACANTHERPESTES MAJOR, AN AMPHIBIOUS MILLIPEDE OF COAL MEASURE TIMES

MILLOM, market town, urban district, Whitehaven parliamentary division, Cumberland, England, on the L.M.S. railway. Pop. (1921) 8,078. The church of Holy Trinity, early Norman and Decorated in date, is of interest for its pillars, alternately round and octagonal, and for a window in the north aisle. A massive roodstone stands in the churchyard. Millom castle, dating from the Conquest, was fortified (14th century) by Sir John Huddlestone, whose descendants held it until 1774. Though strongly built, the castle has been largely dismantled. In the neighbourhood of Millom there are blast furnaces and highly productive mines of red haematite. The mining company has expended upwards of £120,000 upon a sea-wall and embankment to protect the works from the sea.

MILLS, JOHN (d. 1736), English actor, was a member of the company at Drury Lane, London from 1695 almost uninterruptedly to his death, playing and creating hundreds of parts. He was at his best in tragedy. His wife was an actress, and their son William—"the younger Mills"—was also an actor of some merit.

MILLS, ROGER QUARLES (1832–1911), American legislator, was born in Todd county, Ky., on March 30, 1832. He went to Texas in 1839, studied law, and was admitted to the bar. He entered the Confederate army in 1861, took part as a private in the battle of Wilson's Creek, and as colonel at Arkansas Post, Chickamauga, Missionary Ridge and Atlanta. He served in the national House of Representatives as a Democrat in 1873–92, and in the Senate 1892–99. He made the tariff his special study, and was long recognized as a leading authority in Congress. As chairman of the ways and means committee he reported in April, 1888, the "Mills bill," which provided for a reduction of the duties on sugar, earthenware, glassware, plate glass, woollen goods and other articles, the substitution of *ad valorem* for specific duties in many cases, and the placing of lumber, hemp, wool, flax, borax, tin plates, salt and other articles on the free list. This bill was passed by the Democratic House on July 21, and was then so amended by a Republican Senate as to be unacceptable to the house. The tariff thus became the chief issue in the presidential campaign of 1888. During the free silver controversy he adhered to the Cleveland section of the Democratic Party, and failed to be re-elected when his term in the Senate expired in 1899. He then engaged in business and the practice of law in Corsicana, Tex., where he died on Sept. 2, 1911.

MILLSTONE: *see* FLOUR AND FLOUR MANUFACTURE.

MILLVALE, a manufacturing borough of Allegheny county, Pennsylvania, U.S.A., on the Allegheny river, opposite Pittsburgh. It is served by the Baltimore and Ohio and the Pennsylvania railways. Pop. (1920) 8,031 (15% foreign-born white); and was 8,166 in 1930.

MILLVILLE, a city of Cumberland county, New Jersey, U.S.A., on the Maurice river, 40 m. S. by E. of Philadelphia. It is served by the Pennsylvania railway system, trolley and motorbus lines and river barges. The population was 14,691 in 1920 (92% native white) and was 14,705 in 1930 by the Federal census. The principal industry (established in 1806) is the manufacture of glass, almost all kinds except for windows. Textile manufactures (dating from 1854) and the mining of sand are also important. The factory output in 1925 was valued at $8,098,127. The site of Millville is part of a large tract bought before 1790 by the Union company, which built a dam across the river, forming a beautiful pond 3 m. long and a mile wide (now called Union lake and included in a large public park), and established saw-mills there, from which lumber was floated down the river for half a century. The property changed hands in 1795, and in 1803 a town was laid out on the present site by Joseph Buck, with the plan (not then carried out) of moving the mills from the pond to the banks of the river. Millville was incorporated as a city in 1866, and in 1913 a commission form of government was adopted.

MILMAN, HENRY HART (1791–1868), English historian and ecclesiastic, third son of Sir Francis Milman, Bart., physician to George III., was born in London on Nov. 10, 1791. He was educated at Eton and at Brasenose college, Oxford. He gained the Newdigate prize with a poem on the *Apollo Belvidere* in 1812, was elected a fellow of Brasenose in 1814, and in 1816 won the English essay prize with his *Comparative Estimate of Sculpture and Painting.* In 1816 he was ordained, and two years later was presented to the living of St. Mary's, Reading. Milman's early work included tragedies, epic poems, hymns and translations from the classics. In 1821 he was elected professor of poetry at Oxford.

Turning to another field, Milman published in 1829 his *History of the Jews,* which is memorable as the first by an English clergyman which treated the Jews as an oriental tribe, recognized sheikhs and amirs in the Old Testament, sifted and classified documentary evidence, and evaded or minimized the miraculous. In consequence, his inevitable preferment was delayed. In 1835, however, Sir Robert Peel made him rector of St. Margaret's, Westminster, and canon of Westminster, and in 1849 he became dean of St. Paul's. By this time Milman was generally revered and beloved. His *History of Christianity to the Abolition of Paganism in the Roman Empire* (1840) had been ignored; but his reputation was fully established by the continuation of that work, his *History of Latin Christianity* (1855), which has passed through many editions. In 1838 he had edited Gibbon's *Decline and Fall of the Roman Empire,* and in the following year published his *Life of Gibbon.* Milman died on Sept. 24, 1868, and was buried in St. Paul's cathedral.

See A. C. Tait, *Sermon in Memory of H. H. Milman* (1868), and A. Milman, *H. H. Milman* (1900). *See* also the *Memoirs of R. Milman, bishop of Calcutta,* by his sister, Frances Maria Milman (1879).

MILNE, SIR GEORGE FRANCIS (1866–), British field marshal, born Nov. 5, 1866; joined the Royal Artillery in 1885. He served in the Nile Expedition of 1898, and the South African War (1899–1902). In 1913 he became commander of the artillery of the 4th Div., with which he went out to France in 1914. He was given, in July 1915, command of the 27th Div., which, three months later, he took to the Salonika theatre where, at the end of the year, he was placed in charge of an army corps. In May 1916 Milne was advanced to the command of the British

forces in Macedonia, and he occupied this responsible position under the orders of three successive French commanders-in-chief until the end of the struggle. He filled a difficult position with unfailing tact and sound judgment: after the final victory in 1918, he remained in charge of the British forces in the Near East and about the Black Sea until 1920, and on return to England was appointed to the Eastern command. In Feb. 1926 he succeeded Lord Cavan as Chief of the Imperial General Staff.

MILNE, JOHN (1850–1913), British seismologist and mining engineer, was born at Liverpool on Dec. 30, 1850, and educated at King's College, London and the Royal School of Mines. He worked as mining engineer in Newfoundland and Labrador, and in 1874 went as geologist with Dr. Beke's expedition to North-western Arabia. In 1875 he was appointed professor of geology and mining in the Imperial Engineering College at Tokyo, where he remained for 20 years. Milne was recognized as a leading first authority on seismology. He travelled widely in the East, and about 1880 established the seismic survey of Japan, with 968 stations. He invented various forms of seismograph. In 1894 he returned to England, and established a private observation station near Newport, I. of Wight. As secretary of the seismological committee of the British Association he was largely responsible for the establishment of seismological stations throughout the world. He died on July 30, 1913.

He published two standard works, *Earthquakes* (1883), and *Seismology* (1898), besides many books on scientific mining and crystallography, and papers in scientific journals.

MILNE-EDWARDS, HENRY (1800–1885), French zoologist, the son of an Englishman, was born in Bruges, Oct. 23, 1800, but spent most of his life in France. He graduated in medicine at Paris in 1823, but devoted himself to the study of the lower forms of animal life. In 1841 he was appointed professor of entomology at the muséum d'histoire naturelle, and 21 years later he succeeded Geoffrey Saint-Hilaire in the chair of zoology. He died in Paris on July 29, 1885.

Besides his papers in the *Annales des sciences naturelles*, with the editorship of which he was associated from 1834, he published: *Histoire naturelle de crustacés* (3 vols., 1837–41); *Histoire naturelle des coralliaires* (1858–60); and the excellent *Leçons sur la physiologie et l'anatomie comparée de l'homme et des animaux* (14 vols., 1857–81).

MILNER, ALFRED MILNER, VISCOUNT (1854–1925), British statesman and colonial administrator, was born at Bonn on March 23, 1854, the only son of Charles Milner, M.D., whose wife was a daughter of Major-General Ready, sometime governor of the Isle of Man. Alfred Milner was educated first at Tübingen, where his father was Reader in English of the university, then at King's College, London, and under Jowett as a scholar of Balliol College, Oxford, from 1872 to 1876. He graduated in 1877, with a first class in classics, having won the Hertford, Craven, Eldon and Derby scholarships, and was elected to a fellowship of New College. At Oxford he formed a close friendship with Arnold Toynbee, and was associated with his schemes of social work; and subsequently he wrote a tribute to his friend, *Arnold Toynbee: a Reminiscence* (1895). In 1881 he was called to the bar at the Inner Temple and joined the staff of the *Pall Mall Gazette* under John Morley, becoming assistant editor under W. T. Stead. In 1885 he was Liberal candidate for the Harrow division of Middlesex at the general election, but was defeated. He acted as private secretary to Mr. (afterwards Lord) Goschen, and in 1887, when Goschen became chancellor of the exchequer, was appointed his principal private secretary. It was by Goschen's influence that in 1889 he was made under-secretary of finance in Egypt. He remained in Egypt four years, his period of office coinciding with the first great reforms, after the danger of bankruptcy had been avoided. Milner returned to England in 1892, and was appointed chairman of the Board of Inland Revenue, being made C.B. in 1894 and K.C.B. in 1895. Shortly after his return to England he published his *England in Egypt*, which at once became the authoritative account of the work done since the British occupation.

Sir Alfred Milner remained at the Board of Inland Revenue until 1897. In April of that year Lord Rosmead resigned his posts of high commissioner for South Africa and governor of Cape Colony. The situation resulting from the Jameson raid (*see* TRANSVAAL and SOUTH AFRICA) was one of the greatest delicacy and difficulty, and Mr. Chamberlain, now colonial secretary, selected Milner as Lord Rosmead's successor. The appointment was avowedly made in order that an acceptable British statesman, in whom public confidence was reposed, might go to South Africa to consider all the circumstances, and to formulate a policy which should combine the upholding of British interests with the attempt to deal justly with the Transvaal and Orange Free State governments.

Sir Alfred Milner reached the Cape in May 1897, and after the difficulties with President Kruger over the Aliens' Law had been patched up he was free by August to make himself personally acquainted with the country. Between August 1897 and May 1898 he travelled through Cape Colony, the Bechuanaland Protectorate, Rhodesia and Basutoland, and also during this period learned both Dutch and the South African "Taal." He came to the conclusion that there could be no hope of peace and progress in South Africa while there remained the "permanent subjection of British to Dutch in one of the Republics." He also realized—as was shown by the triumphant re-election of Mr. Kruger to the presidency of the Transvaal in Feb. 1898—that the Pretoria government would never on its own initiative redress the grievances of the "Uitlanders." That Milner had good grounds for his view of the situation is shown in a letter written (March 11) by Mr. J. X. Merriman to President Steyn of the Free State: "The greatest danger," wrote Mr. Merriman, "lies in the attitude of President Kruger and his vain hope of building up a State on a foundation of a narrow unenlightened minority." Though this was recognized by the more far-seeing of the Bond leaders, they were ready to support Kruger, whether or not he granted reforms, and they sought to make Milner's position impossible. At the general election in Cape Colony the Bond obtained a majority, and in accordance with constitutional practice were invoked to form a ministry. In November he visited England, and the next February (1899) returned, assured of support, to find the situation more critical. On May 4 Milner penned a memorable despatch to the Colonial Office, in which he insisted that the remedy for the unrest in the Transvaal was to strike at the root of the evil—the political impotence of the injured. "It may seem a paradox," he wrote, "but it is true that the only way for protecting our subjects is to help them to cease to be our subjects." The policy of leaving things alone only led from bad to worse, and "the case for intervention is overwhelming." Milner felt that only the enfranchisement of the Uitlanders in the Transvaal would give stability to the South African situation. He realized keenly that the spectacle of thousands of British subjects in the Transvaal in the condition of "helots" (as he expressed it) was undermining the prestige of Great Britain throughout South Africa. This despatch was kept private for a time by the home government but its tenor was known to the leading politicians at the Cape, and at the instance of J. H. Hofmeyr a conference was held (May 31–June 5) at Bloemfontein between the high commissioner and the president of the Transvaal. Milner then made the enactment by the Transvaal of a franchise law which would at once give the Johannesburgers a share in the government of the country his main, and practically his only, demand. The conference ended without any agreement being reached, and war broke out in Oct. 1899.

In Feb. 1901 he was called upon to undertake the administration of the two Boer states, both now annexed to the British Empire, though the war was still in progress. He thereupon resigned the governorship of Cape Colony, while retaining the post of high commissioner. The work of reconstructing the civil administration in the Transvaal and Orange River Colony could only be carried on to a limited extent while operations continued in the field. Milner therefore returned to England for a holiday; on his arrival he was raised to the peerage with the title of Baron Milner of St. James's and Cape Town. Meanwhile the diplomacy of 1899 and the conduct of the war had caused a great change in the attitude of the Liberal party in England towards Lord Milner. A violent agitation for his recall, in which Sir Henry Campbell-Bannerman joined, was organized, but without success, and in

August he returned to South Africa, where he plunged into the herculean task of remodelling the administration. In the negotiations for peace he was associated with Lord Kitchener, and the terms of surrender, signed at Pretoria on May 31, 1902, were drafted by him. On July 15 he was made a viscount.

Immediately following the conclusion of peace Milner published (June 21) the Letters Patent establishing the system of crown colony government in the Transvaal and Orange River colonies, and exchanging his title of administrator to that of governor. The reconstructive work necessary after the ravages of the war was enormous. He provided a steady revenue by the levying of a tax of 10% on the annual net produce of the gold mines, and devoted special attention to the repatriation of the Boers, land settlement by British colonists, education, justice, the constabulary, and the development of railways. During a visit to Europe he was offered the post of secretary of State for the Colonies, but refused, returning to South Africa, where economic depression was becoming pronounced. He was back in Johannesburg in Dec. 1903, and had to consider the crisis in the gold-mining industry caused by the shortage of native labour. Reluctantly he agreed, with the assent of the home government, to the proposal of the mineowners to import Chinese coolies on a three years' contract.

In the latter part of 1904 and the early months of 1905 Lord Milner was engaged on the elaboration of a scheme to provide the Transvaal with a system of "representative" government, a half-way house between crown colony administration and that of self-government. Letters Patent providing for representative government were issued on March 31, 1905. Owing to the advent of a Liberal ministry in England, in Dec. 1905, this scheme remained inoperative. (*See* TRANSVAAL: *History*.) For some time he had suffered in health from the incessant strain of work, and he determined to retire. He left Pretoria on April 2, and sailed for Europe on the following day. Speaking at Johannesburg on the eve of his departure, he recommended to all concerned the promotion of the material prosperity of the country and the treatment of Dutch and British on an absolute equality. When he left, the economic crisis was still acute and criticism rife. But the foundations of revival had been laid.

Experience in South Africa had shown him that underlying the difficulties of the situation there was the wider problem of imperial unity. In his farewell speech at Johannesburg he concluded with a reference to the subject. "When we who call ourselves Imperialists talk of the British Empire we think of a group of states bound, not in an alliance—for alliances can be made and unmade—but in a permanent organic union. Of such a union the dominions of the sovereign as they exist to-day are only the raw material." This thesis he further developed in a magazine article written in view of the colonial conference held in London in 1907. He advocated the creation of a permanent deliberative imperial council, and favoured preferential trade relations between the United Kingdom and the other members of the empire; and in later years he took an active part in advocating the cause of tariff reform and colonial preference.

Milner occupied himself mainly, after his return from South Africa, with business interests in the City of London. He was active on behalf of causes which appealed to him from the imperial side, and he made several speeches on behalf of tariff reform and colonial preference. He was roused, however, by Lloyd George's budget of 1909, and he advised the House of Lords to reject the Finance Bill, and, as he said at Glasgow, to "damn the consequences." He made several speeches in the next 12 months in defence of the Lords' position; and when the Parliament Bill came up to the House of Lords in 1911, he was a leading spirit among the "Diehards" who advised resistance to the end.

Lloyd George, when he formed his first war ministry in December 1915, at once turned to Milner, the only British administrator who before 1914 had directed a war from the civil side, and constituted him one of his principal colleagues in his War Cabinet of four. From this time to the cessation of hostilities their relations were close, and, after Lloyd George, Milner took the largest share in the civilian conduct of the War. Milner's experience, scholarship, steadiness and somewhat bureaucratic habit of mind supplied an invaluable complement to his chief's daring, impatience of precedent, quickness of apprehension and intellectual agility. In February 1917 he attended, on behalf of the British Government, a conference of the Allies in St. Petersburg (Leningrad).

He devoted himself to his duties in the War Cabinet, seldom appearing in the House of Lords except to explain and defend the government's food policy. The acceptance by the government of the principle of imperial preference, and of the conservation of the raw materials of the Empire, owed much to his influence and support. He worked heartily for inter-Allied co-operation in the conduct of the War, and he was in France as the representative of the British cabinet at the time of the victorious German advance in March 1918; it was largely owing to his influence that General Foch was appointed generalissimo of the Allied forces in France on March 26. Lord Milner was made secretary for war on April 19, and presided over the Army Council during the succeeding months of the year which ended with victory.

After the general election, Lord Milner became colonial secretary. In that capacity he attended the Paris Peace Conference, and was a signatory to the Treaty of Versailles; and he subsequently helped to deal with a number of difficult questions arising under the treaty out of the disposal of the German colonies conquered in war. His financial authority was invoked to defend ministerial finance in the House of Lords; and when a serious revolutionary outbreak took place in Egypt in 1919, he was sent there in December, at the head of a special mission. The mission remained till March and subsequently conferred with Zaghlul Pasha, the Nationalist leader in London. In November they recommended the recognition of Egyptian independence. Great Britain was to guarantee the integrity of Egypt against aggression; she would have a privileged position in Egypt and would maintain a garrison in the canal zone. The capitulations were to be abolished, and the veto on legislation affecting foreigners would be vested in the high commissioner. Lord Milner resigned, February 1921, and was given the Order of the Garter. Before the end of the month he married Lady Edward Cecil, the widow of Lord Edward Cecil, formerly Miss Violet Maxse.

After this, though he took an active part in the work of the Rhodes Trust, and also published his views (*Questions of the Hour*, 1923), Milner only once showed any disposition to resume public work. When Baldwin, in the autumn of 1923, appealed to the country for a mandate to introduce protection, Milner accepted the chairmanship of a committee to advise the government as to the proposed tariff. As the electorate rejected protection, the committee proved abortive. Soon after returning from a visit to South Africa he was attacked by sleeping sickness and died on May 13, 1925, at Sturry Court, near Canterbury. There was found among his papers, and published shortly after his death, an impressive document containing his *Credo* (1925).

See also E. B. Iwan-Müller, *Lord Milner and South Africa* (1902); W. B. Worsfold, *Lord Milner's Work in South Africa* (1906); W. T. Stead, "Sir Alfred Milner," in *The Review of Reviews*, vol. xx. (1899); and the bibliography to SOUTH AFRICA. *The Nation and the Empire* (Collected Speeches 1913).

MILNGAVIE (locally pronounced Millguy), burgh, Dumbartonshire, Scotland, 6 m. N.N.W. of Glasgow by L.N.E.R. Pop. (1931), 5,056. Industries include bleach-fields, dye-works, and a paper-mill; but the town is largely a residential quarter for Glasgow. Close to the town are two large reservoirs, in which is stored the water from Loch Katrine. Mugdock Castle, 1¾ m. N. of Milngavie, is an old stronghold of the Grahams; in Baldernock parish, about 2 m. E., stands a megalith, called "the Auld Wives' Lift" (400 ft.), commanding a fine view.

MILO or **MILON,** of Crotona, Greek athlete, lived about the end of the 6th century B.C. He was six times crowned at the Olympic games and six times at the Pythian for wrestling, and was famous throughout the civilized world for his feats of strength—such as carrying an ox on his shoulders through the stadium at Olympia. In his native city he was much honoured, and he commanded the army which defeated the people of Sybaris in 511. The traditional account of his death is often used to point a moral:

he found a tree which some woodcutters had partially split with a wedge, and attempted to rend it asunder; but the wedge fell out, and the tree closed on his hand, imprisoning him till wolves came and devoured him. His name became proverbial for personal strength (Diod. Sic. xii. 9; Strabo vi. 263; Herodotus iii. 137).

MILO, TITUS ANNIUS, Roman politician, was the son of C. Papius Celsus, but was adopted by his mother's father, T. Annius Luscus. He joined the Pompeian party, and organized bands of mercenaries and gladiators to support the cause by public violence in opposition to P. Clodius, who gave similar support to the democratic cause. Milo was tribune of the plebs in 57 B.C. He took a prominent part in bringing about the recall of Cicero from exile, in spite of the opposition of Clodius. In 53, when Milo was candidate for the consulship and Clodius for the praetorship, the two leaders met by accident on the Appian Way at Bovillae and Clodius was murdered (January 52). Milo was impeached; his guilt was clear, and his enemies took every means of intimidating his supporters and his judges. Cicero was afraid to speak, and the extant *Pro Milone* is an expanded form of the unspoken defence. Milo went into exile at Massilia, and his property was sold by auction. He was the only man excepted from Caesar's general amnesty. He joined M. Caelius Rufus in 48 in his rising against Caesar, but was slain near Thurii in Lucania. His wife was Fausta, daughter of the dictator Sulla.

MILO OF GLOUCESTER, lord of Brecknock and earl of Hereford (d. 1143), was the son of Walter of Gloucester, who appears as sheriff of that county between 1104 and 1121, when he was succeeded by his son who later combined this office with that of local justiciar for Gloucestershire. After the death of Henry I. he declared for Stephen, at whose court he appears as constable in 1136. But in 1139, when the empress Matilda appeared in England, he declared for her, and placed the city of Gloucester at her disposal. He sacked the royalist city of Worcester and reduced the county of Hereford. In 1141, at Matilda's coronation, he was rewarded with the earldom of Hereford. He remained loyal to the empress after her defeat at Winchester.

See the *Continuation of Florence of Worcester* (ed. B. Thorpe, 1848–49); the Cartulary of Gloucester Abbey (Rolls series); and J. H. Round, *Geoffrey de Mandeville* (1892).

MILORADOVICH, MICHAEL ANDRIJEVICH, COUNT (1770–1825), Russian general, saw service under Suvarov in the wars against Turkey and Poland, and in the campaign of Italy and Switzerland (1799) earned much distinction as a commander of advanced troops. In 1805, having attained the rank of lieutenant-general, he served under Kutusov in the campaign of Austerlitz. In the Turkish War he distinguished himself at Guirgevo (1807). Promoted general of infantry in 1810, he commanded a corps at Borodino, and subsequently inflicted the defeat of Tarutino (or Winkovo) on Murat, king of Naples (Oct. 18, 1812). His corps was one of those most active in the pursuit of Napoleon's *Grande Armée,* and in 1813 he led the rear-guard of the Allies after their earlier defeats. He led a Russian-Prussian corps, at Leipzig and in the campaign of 1814. From 1818 to the time of his death he was military governor of St. Petersburg. He perished in the popular outbreak in the capital, on Dec. 26, 1825.

MILOŠ OBRENOVIĆ I. (1780–1860), prince of Serbia, founder of the Obrenović dynasty, was born in 1780 of poor Serbian peasants, and began life as a cattle-drover. Appointed voivode by Karageorge (*q.v.*) in 1807, Miloš distinguished himself both as military leader and administrator, and early became one of the leaders of the Russophil opposition to Karageorge, with whom he had a personal feud, believing him to have poisoned his half-brother. He was one of the few Serb leaders who remained behind when Karageorge and his followers fled in 1813 (*see* SERBIA) and obtained from the Turks the post of voivode of Rudnik, in central Serbia, in return for his co-operation in restoring order. His attitude, when a fresh Serbian revolt broke out against the cruelties of the returning Turks, was at first most equivocal; but at last he decided to join the rebels, and on Palm Sunday 1815 proclaimed the new revolt in the church of Takovo. By diplomatic astuteness and bribery, but chiefly by representing himself to the Turks as alone capable of restraining the extreme Serbian patriots, Miloš persuaded them to raise no active opposition to his election in 1817 as supreme prince of Serbia; shortly before he had almost certainly had his old chief and rival Karageorge murdered in his sleep. The Turkish régime was gradually relaxed, although the new position remained undefined, until the Hatti-sherif of 1830 recognized Miloš as hereditary prince, besides granting the Serbs other concessions.

While preserving the appearance of loyalty to the Porte, Miloš actually furthered his own ambitions. He did much for the organization of his country, but more for himself, and so tyrannical were the methods by which he enriched himself as to evoke a rebellion in 1824. His general enemies were assassinated; his officials forced to dust his boots; and he secured to himself the monopoly of the export of swine to Austria, Serbia's most lucrative trade. At last his exasperated people forced him in 1835 to grant a democratic constitution which in turn brought on him the disfavour both of the Porte and of Russia. Russia's intrigues with the Serb opposition at last forced Miloš to abdicate (1839). His sons Milan and Michael III. (*q.v.*) ruled Serbia; Miloš lived on his estates in Rumania, or in Vienna. He was recalled to the throne in 1859, on the deposition of Prince Alexander Karageorgević, but had only just time to show that his ideas remained unchanged. He died on Sept. 27, 1860, in Belgrade.

MILOVANOVIĆ, MILOVÁN (1863–1912), Serbian statesman and diplomatist, was born at Belgrade on March 2, 1863, and was educated there and in Paris, where he was the first Serb to take his degree as doctor of law and was awarded a gold medal for his thesis. On returning home he was appointed professor of international law at Belgrade university and soon acquired the position of one of Serbia's leading jurists. He was mainly responsible for drafting the new Serbian Constitution of 1888; and, becoming secretary of the central committee of the Radical party, he entered politics and held successively the portfolios of justice, commerce and finance during the closing decade of last century. In 1901 he went to Rome as minister, and retained his post after the revolution of 1903. In 1907 he represented Serbia at the Second Hague Conference, and was appointed a member of the international court of arbitration. In July 1908 he was made foreign minister in the Vetimirović cabinet, and thus had to guide Serbian policy through the difficult period of the Bosnian annexation crisis.

In 1911 he succeeded Păsić as premier. In foreign politics he showed signal moderation, and though a confirmed Russophil, initiated negotiations for a commercial treaty with Austria-Hungary and actively favoured good relations with Turkey. He was one of the chief founders of the Balkan League, the decisive step towards the creation of which was taken at a meeting between Milovanović and the Bulgarian premier, Gueschov, on Oct. 11, 1911. Secret negotiations continued throughout the winter and led to the conclusion of the Serbo-Bulgarian treaty of March 13, 1912 (*see* SERBIA). Discussions were still pending between the various Balkan capitals for a more precise and comprehensive project of alliance when, on July 1, 1912 at Belgrade, Dr. Milovanović died suddenly of heart failure. His removal at so critical a juncture was a grave blow to the cause of peace and moderation, and also deprived Serbia of her ablest statesman since the death of Prince Michael.

MILREIS. The Reis was the monetary unit of Portugal, and was naturally adopted in her South American colonies. With its depreciation in bygone days, it became too small to be convenient, and was replaced by the *milreis,* or thousand *reis.* When Brazil won her independence, she retained the *milreis* as her monetary unit, and as Portugal now calls the *milreis* the *escudo* (*q.v.*), the *milreis* is the monetary unit of Brazil.

A thousand *milreis* are known as a *conto.* It is written as 1,000-$000, while one *milreis* is written as 1$000. Subsidiary coins are of 500, 200, 100 and 50 *reis* in denomination.

Though nominally a gold coin, the *milreis* has always consisted of inconvertible currency notes. *See* BRAZIL.

MILTIADES, the name of two Athenian statesmen and generals of a family (the Philaidae) of Aeginetan origin, which claimed descent from Aeacus.

1. MILTIADES (6th century B.C.), the son of Cypselus, a prominent opponent of Peisistratus. He founded an Athenian colony in the Thracian Chersonese at the request of the Doloncians (Herod. vi. 36). He became "tyrant" of the Chersonese which he fortified by a wall across the isthmus from Cardia to Pactya. He was captured by the people of Lampsacus, but released on the intercession of Croesus of Lydia. He was succeeded by Stesagoras, son of his half-brother, Cimon.

2. MILTIADES (died *c.* 488 B.C.), the victor of Marathon (*q.v.*), was another son of Cimon. On the death of Stesagoras, he was sent to the Chersonese (? about 518–516) by Hippias—no doubt to support Hegesistratus at Sigeum (*see* PEISISTRATUS). He entrapped and imprisoned the chief men of the Chersonese, which was then in a turbulent condition, and married Hegesipyle, daughter of the Thracian prince Olorus (Herod. vi. 39). He led a contingent in the Scythian expedition of Darius Hystaspes, but Herodotus' story of the subsequent event is improbable (*see* SCYTHIA) and is probably derived from Alcmaeonid tradition, hostile to Miltiades. According to Herodotus, he advised the destruction of the Danube bridge, which would have cut off Darius' retreat, and was subsequently driven out by Scythian invaders, being restored by the Doloncians; he then fled to Athens on the arrival of the Persian expedition under Datis and Artophernes (492 B.C.), and was at once impeached for tyranny.

On the approach of the Persians Miltiades was made one of the ten Athenian generals, and it was on his advice that the polemarch Callimachus decided to give battle at Marathon (*q.v.*). Subsequently he obtained a fleet of 70 ships from the Athenians, with a commission, according to Cornelius Nepos, to regain control over the Aegean. Herodotus says that, having besieged Paros vainly for nearly a month, he made a secret visit to Timo, a priestess of Demeter in Paros, with a view to the betrayal of the island, and being compelled to flee wounded himself severely in attempting to leap a fence (but *see* Ephorus in *Fragm. hist. gr.* 107). In any case, the siege was raised for some reason, and the Alcmaeonidae had him impeached on some charge on his return. All that is known is that he died of his wound (489–488), without paying the fine, which was paid subsequently by his son Cimon (*q.v.*). He appears to have been a man of strong determination and great personal courage, of a type characteristic of the pre-Cleisthenic constitution. His absence in the Chersonese during the first years of the new democracy (508–493?) and his patrician lineage account naturally for the difference which existed between him and the popular leaders—Themistocles and Aristides.

See Herodotus, vi., and Cornelius Nepos, *Miltiades,* and histories of Greece. On the Parian expedition and the trial, R. W. Macan, *Herodotus iv.–vi.,* vol. 2, appendix xi.; on the foreign policy of Miltiades *see* THEMISTOCLES.

MILTON, JOHN (1608–1674), English poet, was born in Bread Street, Cheapside, London, on Dec. 9, 1608. His father, John Milton of Bread Street, scrivener, was himself an interesting man. He was the son of a staunch Roman Catholic, and turned Protestant at Oxford, for which he was disinherited. How he supported himself in London at first is obscure; perhaps his musical abilities helped him. He was about 37 when he became qualified early in 1600. He then set up at the Spread Eagle, Bread Street, and married Sarah Jeffrey; John Milton the younger was the second of their children who survived infancy.

Education.—When Milton was ten years old he had as tutor Thomas Young, afterwards master of Jesus college, Cambridge; he stayed till 1622, but before then Milton had already started to go to St. Paul's. Music was a natural part of his home environment, as his father was of some note in the musical world. Milton's chief friend at school was Charles Diodati, who left to go to Oxford in 1623. Milton stayed till 1624.

Milton had then all but completed his 16th year, and was as scholarly, as accomplished and as handsome a youth as St. Paul's school had sent forth. We learn from himself that his exercises "in English or other tongue, prosing or versing, but chiefly this latter," had begun to attract attention even in his boyhood. Of these poems the only specimens that now remain are two copies of Latin verses, preserved in a commonplace book of his (printed by the Camden Society in 1877), and his "Paraphrase on Psalm cxiv." and his "Paraphrase on Psalm cxxxvi." At the age of 16 Milton was entered as a student of Christ's college, Cambridge, in the grade of a "Lesser Pensioner," and he matriculated two months later, on April 9, 1625. At least three students who entered Christ's after Milton, but during his residence, deserve mention. One was Edward King, a youth of Irish birth and high Irish connections, who entered in 1626, at the age of fourteen; another was John Cleveland, afterwards known as royalist and satirist, who entered in 1627; and the third was Henry More, subsequently famous as the Cambridge Platonist, who entered in 1631, just before Milton left. Milton's own brother, Christopher, joined him in the college in February 1630/31, at the age of fifteen.

Milton's academic course lasted seven years and five months, bringing him from his 17th year to his twenty-fourth. In his second year he quarrelled with his tutor, Chappell. Johnson's suggestion that Milton may have been one of the last students to suffer corporal punishment deserves no credit; all we know is that he left college for a time and was transferred on his return to the tutorship of Nathaniel Tovey. For the first two or three years of his undergraduateship, he was generally unpopular among the younger men of his college. They had nicknamed him "the Lady" —a nickname which the students of the other colleges took up, converting it into "the Lady of Christ's"; and, though the allusion was chiefly to the peculiar grace of his personal appearance, it conveyed also a sneer at what the rougher men thought his unusual prudishness, the haughty fastidiousness of his tastes and morals. A change in this state of things had certainly occurred before January 1628/29, when, at the age of 20, he took his B.A. degree. By that time his intellectual pre-eminence had come to be acknowledged. In July 1632 Milton took his M.A. degree. Tradition still points out Milton's rooms at Christ's college. They are on the first floor on the first stair on the north side of the great court.

Early Writings.—Of Milton's skill at Cambridge, specimens remain in his *Prolusiones quaedam oratoriae.* They consist of seven rhetorical Latin essays, generally in a whimsical vein, delivered by him, either in the hall of Christ's college or in the public university schools. To Milton's Cambridge period belong four of his Latin "Familiar Epistles," and the greater number of his preserved Latin poems, including: (1) the seven pieces, written in 1626, which compose his *Elegiarum liber,* two of the most interesting of them addressed to his friend, Charles Diodati, and one to his former tutor, Young, in his exile at Hamburg; (2) the five short Gunpowder Plot epigrams, now appended to the *Elegies;* and (3) the first five pieces of the *Sylvarum liber,* the most important of which are the hexameter poem "In quintum novembris" (1626), and the piece entitled *Naturam non pati senium* (1628). Of the English poems of the Cambridge period the following is a dated list: "On the Death of a fair Infant" (1625–1626), the subject being the death of the first-born child of his sister Anne Phillips; "At a Vacation Exercise in the College" (1628); the magnificent Christmas ode, "On the Morning of Christ's Nativity" (1629); the fragment called "The Passion" and the "Song on May Morning," both probably belonging to 1630; the poem "On Shakespeare," certainly belonging to that year, printed in the Shakespeare folio of 1632; the two facetious pieces "On the University Carrier" (1630–1631); the "Epitaph on the Marchioness of Winchester" (1631); the sonnet "To the Nightingale," probably of the same year; the sonnet "On arriving at the Age of twenty-three," dating itself certainly in December 1631.

Just before Milton quitted Cambridge, his father, then verging on his 70th year, had practically retired from his Bread Street business, and had gone to spend his declining years at Horton, Buckinghamshire, not far from Windsor. Here Milton mainly resided for the next six years—from July 1632 to April 1638.

Although, when he had gone to Cambridge, it had been with the intention of becoming a clergyman, that intention had been abandoned. His reasons were that "tyranny had invaded the church," and that, finding he could not honestly subscribe the oaths and obligations required, he "thought it better to preserve

a blameless silence before the sacred office of speaking, begun with servitude and forswearing." In other words, he was disgusted with the system which Laud was establishing and maintaining in the Church of England. Eventually he decided to devote himself to scholarship and literature. There seems to have been some remonstrance from his father; in Milton's poem *Ad patrem* their agreement is recorded; Milton had his way. In perfect leisure, and in a pleasant rural retirement, with Windsor at the distance of an easy walk, and London only about 17 m. off, he went through, he tells us, a systematic course of reading in the Greek and Latin classics, varied by mathematics, music, and the kind of physical science we should now call cosmography.

It is an interesting fact that Milton's very first public appearance in the world of English authorship was in so honourable a place as the second folio edition of *Shakespeare* in 1632. His enthusiastic eulogy on Shakespeare, written in 1630, was one of three anonymous pieces prefixed to that second folio. Among the poems actually written by Milton at Horton the first, in all probability, after the Latin hexameters *Ad patrem*, were the exquisite companion pieces *L'Allegro* and *Il Penseroso*. There followed, in or about 1633, the fragment called *Arcades*. It was part of a pastoral masque performed by the young people of the noble family of Egerton, before the countess-dowager of Derby, at her mansion of Harefield, about 10 m. from Horton. That Milton contributed the words for the entertainment was, almost certainly, owing to his friendship with Henry Lawes, who supplied the music. Next in order among the compositions at Horton may be mentioned the three short pieces, "At a Solemn Music," "On Time," and "Upon the Circumcision"; after which comes *Comus*, the largest and most important of all Milton's minor poems. The name by which that beautiful drama is now universally known was not given to it by Milton himself. He entitled it, more simply and vaguely, "A Masque presented at Ludlow Castle, 1634, on Michaelmas night, before John Earl of Bridgewater, Lord President of Wales" (1637). Lawes supplied the music and was stage manager; he applied to Milton for the poetry; and on Sept. 29, 1634, the drama furnished by Milton was performed in Ludlow Castle before a great assemblage of the nobility and gentry of the Welsh principality, Lawes taking the part of "the attendant spirit," while the parts of "first brother," "second brother" and "the lady" were taken by the earl's three youngest children, Viscount Brackley, Mr. Thomas Egerton and Lady Alice Egerton.

From Sept. 1634 to the beginning of 1637 is a comparative blank in our records. Straggling incidents in this blank are a Greek translation of "Psalm cxiv.," a visit to Oxford in 1635 and the beginning in May 1636 of a troublesome lawsuit against his father by Sir Thomas Cotton, who accused him of misappropriation.

The lawsuit was still in progress when, on April 3, 1637, Milton's mother died, at the age of about sixty-five. The year 1637 was otherwise eventful. It was in that year that his *Comus*, after lying in manuscript for more than two years, was published by itself, in the form of a small quarto of 35 pages. The author's name was withheld, and the entire responsibility of the publication was assumed by Henry Lawes. Milton seems to have been in London when the little volume appeared. He was a good deal in London, at all events, during the months immediately following his mother's death. The plague, which had been on one of its periodical visits of ravage through England since early in the preceding year, was then especially severe in the Horton neighbourhood, while London was comparatively free. It was probably in London that Milton heard of the death of Edward King, who had sailed from Chester for a vacation visit to his relatives in Ireland, when, on Aug. 10, the ship in perfectly calm water struck on a rock and went down, he and nearly all the other passengers going down with her. There is no mention of this event in Milton's two Latin "Familiar Epistles" of September 1637, addressed to his friend Charles Diodati, and dated from London; but in Nov. 1637, and probably at Horton, he wrote his matchless pastoral monody of *Lycidas*. It was his contribution to a collection of obituary verses, Greek, Latin and English, inscribed to the memory of Edward King by his numerous friends, at Cambridge and elsewhere. The collection appeared early in 1638. The second part contained thirteen English poems, the last of which was Milton's monody, signed only with his initials "J. M."

His Tour Abroad.—Circumstances now favoured his plan for a foreign tour. The Cotton lawsuit was at an end, and Milton's younger brother Christopher had married and gone to live at Horton. Before the end of April 1638 Milton was on his way across the channel, taking one English man-servant with him. Through Paris, where Milton was introduced to the famous Hugo Grotius, then ambassador for Sweden at the French court, he moved on rapidly to Italy, by way of Nice. After visiting Genoa, Leghorn and Pisa, he arrived at Florence, in Aug. 1638. Enchanted by the city and its society, he remained there two months, frequenting the chief academies or literary clubs, and even taking part in their proceedings. It was in the neighbourhood of Florence that he "found and visited" the great Galileo, then old and blind, and still nominally a prisoner to the Inquisition for his astronomical heresy.

By way of Florence and Siena, he reached Rome some time in October, and spent about another two months there, not only going about among the ruins and antiquities and visiting the galleries, but mixing also, as he had done in Florence, with the learned society of the academies. The most picturesque incident of his stay in Rome was his presence at a great musical entertainment in the palace of Cardinal Francesco Barberini. Here he had not only the honour of a specially kind reception by the cardinal himself, but also, it would appear, the supreme pleasure of listening to the marvellous Leonora Baroni, the most renowned singer of her age.

Late in November he left Rome for Naples. He had hardly been in Naples a month, however, when there came news from England which urged his immediate return home.. "The sad news of civil war in England," he says, "called me back; for I considered it base that, while my fellow-countrymen were fighting at home for liberty, I should be travelling at my ease for intellectual culture" (*Defensio secunda*). In Dec. 1638, therefore, he set his face northwards again. His return journey, however, probably because he learnt that the news he had first received was exaggerated or premature, was broken into stages. He spent a second January and February (1638/39) in Rome, in some danger, he says, from the papal police, because the English Jesuits in Rome had taken offence at his habit of free speech on the subject of religion. From Rome he went to Florence, where he stayed two months, and in April 1639 he went on, by Bologna and Ferrara, to Venice. About a month was given to Venice; and thence, having shipped for England the books he had collected in Italy, he went, by Verona and Milan, over the Alps, to Geneva. Here he spent a week or two in June, having daily conversations with the great Protestant theologian Dr. Jean Diodati, the uncle of his friend Charles Diodati. From Geneva he returned to Paris, and so to England. He was home again in Aug. 1639, having been absent in all 15 or 16 months.

Milton's Continental tour, and especially the Italian portion of it, which he describes at some length in his *Defensio secunda*, remained one of the chief pleasures of his memory through all his subsequent life. Nor was it without fruits of a literary kind. Besides two of his Latin *Epistolae Familiares*, one to the Florentine grammarian Buommattei, and the other to Lucas Holstenius, there have to be assigned to Milton's 16 months on the Continent his three Latin epigrams *Ad Leonoram Romae canentem*, his Latin scazons *Ad Salsillum poetam romanum aegrotantem*, his fine Latin hexameters entitled *Mansus*, addressed to Giovanni Battista Manso, and his five Italian sonnets, with a canzone, in praise of a Bolognese lady.

His bosom friend and companion from boyhood, Charles Diodati, died in Blackfriars, London, in Aug. 1638, not four months after Milton had gone away on his tour. The intelligence did not reach Milton till some months afterwards, probably not till his second stay in Florence; and, though he must have learnt some of the particulars from his friend's uncle in Geneva, he did not know them fully till his return to England. How profoundly they affected him appears from his *Epitaphium Damonis*,

then written in memory of his dead friend. The importance of this poem in Milton's biography cannot be overrated. It is perhaps the noblest of all his Latin poems; and, though written in the artificial manner of a pastoral, it is unmistakably an outburst of the most passionate personal grief. In this respect *Lycidas*, artistically perfect though that poem is, cannot be compared with it; and it is only the fact that *Lycidas* is in English, while the *Epitaphium Damonis* is in Latin, that has led to the notion that Edward King of Christ's college was peculiarly and pre-eminently the friend of Milton in his youth and early manhood.

We should not have known, but for an incidental passage in the *Epitaphium Damonis* (160–178), that, at the time of his return from Italy, he had chosen a subject for a great poem from the Arthurian legend. This epic was to be in English, and he had resolved that all his poetry for the future should be in the same tongue.

London and Public Affairs.—Not long after Milton's return Christopher Milton and his wife went to reside at Reading, taking the old gentleman with them, while Milton himself preferred London. He had first taken lodgings in St. Bride's churchyard, at the foot of Fleet street; but, after a while, probably early in 1640, he removed to a "pretty garden house" of his own, at the end of an entry, in part of Aldersgate street. His sister, whose first husband, Edward Phillips, had died in 1631, had married a Mr. Thomas Agar, his successor in the Crown Office; and it was arranged that her two sons by her first husband should be educated by their uncle. John Phillips, the younger of them, only nine years old, had boarded with him in the St. Bride's churchyard lodgings; and, after the removal to Aldersgate street, the other brother, Edward Phillips, only a year older, became his boarder also. Gradually a few other boys, the sons of well-to-do personal friends, joined the two Phillipses whether as boarders or for daily lessons, so that the house in Aldersgate street became a small private school.

The Arthurian epic had been given up, and his mind was roving among many other subjects, and balancing their capabilities. How he wavered between Biblical subjects and heroic subjects from British history, and how many of each kind suggested themselves to him, one learns from a list in his own handwriting among the Milton mss. at Cambridge. It contains jottings of no fewer than 53 subjects from the Old Testament, eight from the Gospels, 33 from British and English history before the Conquest, and five from Scottish history. It is curious that all or most of them are headed or described as subjects for "tragedies," as if the epic form had now been abandoned for the dramatic. There are four separate drafts of a possible tragedy on the Greek model under the title of *Paradise Lost*, two of them merely enumerating the dramatis personae, but the last two indicating the plot and the division into acts. In 1641 he wrote in the *Reason of Church Government* that he was meditating a poem on high moral or religious subjects. But the fulfilment of these plans was indefinitely postponed. Milton became absorbed in the ecclesiastical controversies following on the king's attempt to force the episcopal system on the Scots.

Not until the Church question became paramount did Milton enter actively into public affairs. On this question there were three parties: the high church party, who wanted episcopacy retained; the middle party, who wanted it curtailed; and the "root-and-branch" party, who wanted it abolished. The manifesto of the high church party was issued by Joseph Hall, bishop of Exeter; it was answered in March 1640/41 by five Puritan clergymen, whose initials put together on the title-page formed the word "Smectymnuus." Thomas Young, Milton's old tutor, was largely responsible for the pamphlet, but Milton's own hand is also discernible in it, and he continued to aid the Smectymnuans in their subsequent rejoinders to Hall's defences of himself.

In May 1641 he put forth a defence of the Smectymnuan side in *Of Reformation touching Church Discipline in England and the Causes that hitherto have hindered it*. He reviewed English ecclesiastical history, with an appeal to his countrymen to resume that course of reformation which he considered to have been prematurely stopped in the preceding century, and to sweep away the last relics of papacy and prelacy. Among all the root-and-branch pamphlets of the time it stood out, and stands out still, as the most thorough-going and tremendous. It was followed by four others in rapid succession—*Of Prelatical Episcopacy and whether it may be deduced from the Apostolical Times* (June 1641), *Animadversions upon the Remonstrant's Defence against Smectymnuus* (July 1641), *The Reason of Church Government urged against Prelaty* (Feb. 1641/42), *Apology against a Pamphlet called a Modest Confutation of the Animadversions*, etc. (March and April 1641/42). The first of these was directed chiefly against the middle party, with especial reply to the arguments of Archbishop Ussher. The greatest of the four, and the most important of all Milton's anti-episcopal pamphlets after the first, is *The Reason of Church Government*. It is there that Milton takes his readers into his confidence, speaking at length of himself and his motives in becoming a controversialist. Poetry, he declares, was his real vocation; it was with reluctance that he had resolved to "leave a calm and pleasing solitariness, fed with cheerful and confident thoughts, to embark in a troubled sea of noises and hoarse disputes"; but duty had left him no option. The great poem or poems he had been meditating could wait; and meanwhile, though in prose-polemics he had the use only of his "left hand," that hand should be used with all its might in the cause of his country and of liberty.

Of Milton's life through the first months of the Civil War little is known. He remained in his house in Aldersgate street, teaching his nephews and other pupils; and the only scrap that came from his pen was the semi-jocose sonnet bearing the title "When the Assault was intended to the City." In the summer of 1643, however, there was a great change in the Aldersgate street household. About the end of May, as his nephew Edward Phillips remembered, Milton went away on a country journey, without saying whither or for what purpose; and, when he returned, about a month afterwards, it was with a young wife, and with some of her sisters and other relatives in her company. He had, in fact, been in the very headquarters of the king and the Royalist army in and round Oxford; and the bride he brought back with him was a Mary Powell, the eldest daughter of Richard Powell, of Forest Hill, near Oxford. She was 17 years and four months old, while Milton was in his 35th year. However the marriage came about, it was a most unfortunate event. The Powell family were strongly Royalist, and the girl herself seems to have been frivolous and entirely unsuited for the studious life in Aldersgate street. Hardly were the honeymoon festivities over, when, her sisters and other relatives having returned to Forest Hill, she pined for home again and begged to be allowed to go back on a visit. Milton consented, on the understanding that the visit was to be a brief one. This seems to have been in July 1643. Soon, however, the intimation from Forest Hill was that he need not look ever to have his wife in his house again. The resolution seems to have been mainly the girl's own; but, as the king's cause was then prospering in the field, Edward Phillips was probably right in his conjecture that the whole of the Powell family had repented of their sudden connection with so prominent a Parliamentarian and assailant of the Church of England as Milton. While his wife was away, his old father, who had been residing for three years with his younger and lawyer son at Reading, came to take up his quarters in Aldersgate street.

Milton's answer to the insult of his wife's desertion was most characteristic. *The Doctrine and Discipline of Divorce, Restored to the good of both Sexes from the Bondage of Canon Law and other Mistakes* was the title of a pamphlet put forth by him in August 1643, without his name, but with no effort at concealment, declaring the notion of a sacramental sanctity in the marriage relation to be a clerically invented superstition, and arguing that inherent incompatibility of character, or contrariety of mind, between two married persons is a perfectly just reason for divorce. There was no reference to his own case, except by implication; but the boldness of the speculation roused attention and sent a shock through London. It was a time when the authors of heresies of this sort, or of any sort, ran considerable risks. That there might be no obstacle to a more public prosecution, Milton put his

name to a second and much enlarged edition of the tract, in February 1644, dedicated openly to the parliament and the assembly. Then, for a month or two, during which the gossip about him and his monstrous doctrine was spreading more and more, he turned his attention to another subject. In June 1644 he published a treatise *Of Education.*

In July he returned to the divorce subject in a pamphlet addressed specially to the clergy and entitled *The Judgment of Martin Bucer concerning Divorce.* The outcry against him then reached its height. A sermon was preached against him before the houses of parliament, and efforts were made to bring him within parliamentary censure. The lead was taken by the Stationers' Company, who had a technical ground of complaint against him. His first divorce treatise, though published immediately after the "Printing Ordinance," requiring all publications to be licensed and registered in the books of the Stationers' Company, had been issued without license and without registration. Complaint to this effect was made against Milton, with some others liable to the same charge in a petition of the Stationers of the House of Commons in August 1644; and the matter came before committee both in that House and in the Lords.

It is to this circumstance that the world owes the most popular and eloquent, if not the greatest, of all Milton's prose writings, his famous *Areopagitica, a Speech of Mr. John Milton for the Liberty of Unlicensed Printing, to the Parliament of England.* It appeared on Nov. 25, 1644, deliberately unlicensed and unregistered, and was a remonstrance addressed to the parliament, calling for the repeal of their ordinance of June 1643 and attacking the whole system of licensing and censorship of the press. Though repeal did not follow, the pamphlet virtually accomplished its purpose. The licensing system had received its death-blow; and, though the Stationers returned to the charge in another complaint to the House of Lords, Milton's offence against the press ordinance was condoned. To this period there belong, in the shape of verse, only his sonnets ix. and x., the first to some anonymous lady, and the second "to the Lady Margaret Ley," with perhaps the Greek lines entitled *Philosophus ad regem quendam.* In March 1644/5 he published simultaneously his *Tetrachordon: Expositions upon the four chief places of Scripture which treat of Marriage,* and his *Colasterion, a Reply to a nameless Answer against the Doctrine and Discipline of Divorce.* In these he replied to his chief recent assailants, lay and clerical, with merciless severity.

So far as Milton was concerned personally, his interest in the divorce speculation came to an end in July or August 1645, when, by friendly interference, a reconciliation was effected between him and his wife. The ruin of the king's cause at Naseby had suggested to the Powells that it might be as well for their daughter to go back to her husband after their two years of separation.

By this time, having an increasing number of pupils, he had taken a house in Barbican, where he stayed till Sept. or Oct. 1647. Among his first occupations there must have been the revision of the proof sheets of the first edition of his collected poems. It appeared as a tiny volume, copies of which are now very rare, with the title, *Poems of Mr. John Milton, both English and Latin, composed at several times. Printed by his true Copies. The songs were set in Musick by Mr. Henry Lawes. . . .* The title-page gives the date 1645, but Jan. 2, 1645/6, seems to have been the exact day of its publication. In English there were only the four sonnets now numbered xi.–xiv., the first two entitled "On the Detraction which followed upon my writing certain Treatises," the third "To Mr. Henry Lawes on his Airs," and the fourth "To the Religious Memory of Mrs. Catherine Thomson," together with the powerful anti-Presbyterian invective or "tailed sonnet" entitled "On the New Forcers of Conscience under the Long Parliament"; and in Latin there were only the ode *Ad Joannem Rousium,* the *Apologus de Rustico et Hero,* and one interesting "Familiar Epistle" (April 1647) addressed to his Florentine friend Carlo Dati.

The fall of Oxford in 1646 compelled the whole of the Powell family to seek refuge in London, and most of them found shelter in Milton's house. His first child, Anne, was born there on July 29, that year; on Jan. 1, 1646/7, his father-in-law Richard Powell died there, leaving his affairs in confusion; and in the following March his own father died there, at the age of 84, and was buried in the adjacent church of St. Giles, Cripplegate.

From Barbican Milton removed, in Sept. or Oct. 1647, to a smaller house in that part of High Holborn which adjoins Lincoln's Inn Fields. His Powell relatives had now left him, and he had reduced the number of his pupils, or perhaps kept only his two nephews. But, though thus more at leisure, he did not yet resume his projected poem, but occupied himself rather with three works of scholarship, which he had already for some time had on hand. One was the compilation in English of a complete history of England, or rather of Great Britain, from the earliest times; another was the preparation in Latin of a complete system of divinity, drawn directly from the Bible; and the third was the collection of materials for a new Latin dictionary. Milton had always a fondness for such labours of scholarship and compilation. Of a poetical kind there is nothing to record, during his residence in High Holborn, but an experiment in psalm-translation, in the shape of Ps. lxxx.–lxxxviii. done into service-metre in April 1648, and the sonnet to Fairfax, written in September of the same year.

Milton's Secretaryship.—Milton's sonnet "On the Lord General Fairfax, at the siege of Colchester," attested the exultation of the writer at the triumph of the parliamentary cause. When the king was beheaded (1649) the first Englishman of mark out of parliament to attach himself openly to the new republic was John Milton. This he did by the publication of his pamphlet entitled *Tenure of Kings and Magistrates, proving that it is lawful, and hath been held so in all ages, for any who have the power, to call to account a Tyrant or wicked King, and, after due conviction, to depose and put him to death, if the ordinary Magistrate have neglected or denied to do it.* It was out within a fortnight after the king's death, and was Milton's last performance in the house in High Holborn. In March 1649 Milton was offered, and accepted, the secretaryship for foreign tongues to the council of state of the new Commonwealth. The salary was to be £288 a year (worth about £1,500 a year now). To be near his new duties in attendance on the council, he removed at once to temporary lodgings at Charing Cross. Thus he must at once have made acquaintance with President Bradshaw, Fairfax, Cromwell himself, Sir Henry Vane, Whitelocke, Henry Marten, Haselrig, Sir Gilbert Pickering and the other chiefs of the council and the Commonwealth, if indeed he had not known some of them before. After a little while, for his greater convenience, official apartments were assigned him in Whitehall itself.

At the date of Milton's appointment to the secretaryship he was 40 years of age. His special duty was the drafting in Latin of letters sent to foreign states and princes, and the examination and translation of letters in reply. As Latin was the language employed in the written diplomatic documents, his post came to be known indifferently as the secretaryship for foreign tongues or the Latin secretaryship. In that post, however, his duties, more particularly at first, were very light in comparison with those of his official colleague, Walter Frost, the general secretary. Foreign powers held aloof from the English republic as much as they could; and Milton's presence was required only when some piece of foreign business turned up. Hence, from the first, his employment in very miscellaneous work. Especially, the council looked to him for everything in the nature of literary vigilance and literary help in the interests of the struggling Commonwealth. He was employed in the examination of suspected papers, and in interviews with their authors and printers; and he executed several great literary commissions expressly entrusted to him by the council. The first of these was his pamphlet entitled *Observations on the Articles of Peace* (between Ormonde and the Irish), published in May 1649. A passage of remarkable interest in it is one of eloquent eulogy on Cromwell. More important still was the *Eikonoklastes* (which may be translated "Image-Smasher"), published by Milton in Oct. 1649, by way of counterblast to the famous *Eikon Basilike* ("Royal Image"), which had been in circulation in thousands of copies since the king's death, and

had become a kind of Bible in all Royalist households, on the supposition that it had been written by the royal martyr himself. (*See* GAUDEN, JOHN.) In the end of 1649 there appeared abroad the *Defensio regia pro Carolo I.*, by Salmasius, the greatest scholar of Europe. Milton threw his whole strength into a reply, through the year 1650, interrupting himself only by a new and enlarged edition of his *Eikonoklastes*. His Latin *Pro populo anglicano defensio* (1651) ran at once over the British Islands and the Continent, and was received by scholars as an annihilation of Salmasius. Through the rest of 1651 the observation was that the two agencies which had co-operated most visibly in raising the reputation of the Commonwealth abroad were Milton's books and Cromwell's battles.

Through 1651 Milton also acted as licenser and superintending editor of the *Mercurius politicus*, a newspaper issued twice a week, of which Marchamont Nedham was the working editor and proprietor. Milton's hand is discernible in some of the leading articles.

About the end of 1651 Milton left his official rooms in Whitehall for a "garden house" he had taken on the edge of St. James's park in what was then called Petty France, Westminster, but is now York street. Milton had now more to do in the special work of his office, in consequence of the increase of correspondence with foreign powers. But he had for some time been in ailing health; and a dimness of eyesight which had been growing upon him gradually for ten years had been settling rapidly, since his labour over the answer to Salmasius, into total blindness. Before or about May 1652, when he was but in his 44th year, his blindness became total, and he could go about only with some one to lead him. Hence a rearrangement of his secretarial duties. Such of these duties as he could perform at home, or by occasional visits to the Council Office near, he continued to perform; but much of the routine work was done for him by an assistant, a well-known German, George Rudolph Weckherlin, succeeded later by Philip Meadows and, eventually, by Andrew Marvell. Precisely to this time of a lull in Milton's secretaryship on account of his ill-health and blindness we have to refer his two great companion sonnets "To the Lord General Cromwell" and "To Sir Henry Vane the Younger."

In 1652 died his only son, who had been born at Whitehall in the March of the preceding year. His wife died in 1653/4, just after she had given birth to his third daughter, Deborah. With the three children thus left him—Anne, but six years old, Mary, not four, and the infant Deborah—the blind widower lived on in his house in Petty France in such desolation as can be imagined. He had recovered sufficiently to resume his secretarial duties; and the total number of his dictated state letters for the single year 1652 is equal to that of all the state letters of his preceding term of secretaryship put together. To the same year there belong also three of his Latin "Familiar Epistles." In December 1652 there was published *Joannis Philippi Angli responsio ad apologiam anonymi cujusdam tenebrionis*, being a reply by Milton's younger nephew, John Phillips, but touched up by Milton himself, to one of several pamphlets that had appeared against Milton for his slaughter of Salmasius.

In Dec. 1653 Cromwell's formal sovereignty began under the name of the Protectorate, causing a split in the party. Milton adhered to Cromwell, and was his Latin secretary through the whole of the Protectorate. For a while, indeed, his Latin letters to foreign states in Cromwell's name were but few, the reason for which may have been that he was then engaged on an answer to the pamphlet from The Hague entitled *Regii sanguinis clamor ad coelum adversus parricidas anglicanos* (March 1652). It came out in May 1654, with the title *Joannis Miltoni Angli pro populo anglicano defensio secunda* (Second Defence of John Milton, Englishman, for the People of England). The author of *Regii sanguinis clamor* was Dr. Peter du Moulin the younger, then moving about in English society, close to Milton; but the reply is made to Alexander More, a professor at Middelburg, to whom the pamphlet was attributed. The *Defensio* contains passages of singular autobiographical and historical value, and includes laudatory sketches of such eminent Commonwealth's men as Bradshaw, Fairfax, Fleetwood, Lambert and Overton, together with a long panegyric on Cromwell himself and his career, which remains to this day unapproached for elaboration and grandeur by any estimate of Cromwell from any later pen.

From about the date of the publication of the *Defensio Secunda* to the beginning of 1655 the only specially literary relics of Milton's life are his translations of Ps. i.–viii. in different metres, done in Aug. 1654, his translation of Horace's *Ode*, i. 5, done probably about the same time, and two of his Latin "Familiar Epistles." The most active time of his secretaryship for Cromwell was from April 1655 onwards. Milton's office was then redefined; the ordinary Foreign Office work was taken off his hands and he was left to deal with special occasions. Hardly was the arrangement made when a signal occasion did occur. In May 1655 all England was horrified by the news of the massacre of the Vaudois Protestants (Waldenses) by the troops of Emanuele II., duke of Savoy and prince of Piedmont, in consequence of their disobedience to an edict requiring them either to leave their native valleys or to conform to the Catholic religion. Cromwell and his council took the matter up with all their energy; and the burst of indignant letters on the subject despatched in that month and the next to the duke of Savoy himself, Louis XIV. of France, Cardinal Mazarin, the Swiss cantons, the states-general of the United Provinces, and the kings of Sweden and Denmark, were all by Milton. His famous sonnet "On the Late Massacre in Piedmont" was his more private expression of feeling on the same occasion. Milton's last Latin pamphlets, the *Pro se Defensio*, and the *Scriptum domini protectoris*, appeared in August.

Through the rest of Cromwell's Protectorate, Milton's life was of comparatively calm tenor. He was in much better health than usual, bearing his blindness with courage and cheerfulness; he was steadily busy with important despatches to foreign powers on behalf of the Protector, then in the height of his great foreign policy; and his house in Petty France seems to have been, more than at any previous time since the beginning of his blindness, a meeting-place for friends and visitors, and a scene of pleasant hospitalities. The four sonnets now numbered xix.–xxii., one of them to young Lawrence, the son of the president of Cromwell's council, and two of the others to Cyriack Skinner, once his pupil, belong to this time of domestic quiet, as do also no fewer than ten of his Latin "Familiar Epistles." His marriage to Katherine Woodcock on Nov. 12, 1656 brought him a brief period of domestic happiness; but, after only 15 months, he was again a widower, by her death in childbirth in February 1657/8. The touching sonnet which closes the series of Milton's *Sonnets* is his tribute to the memory of his second marriage. Some of his greatest despatches for Cromwell, including letters, of the highest importance, to Louis XIV., Mazarin and Charles Gustavus of Sweden, belong to the year 1658. On the whole, there is no doubt of Milton's high opinion of Cromwell; but he felt some doubts about his later policy, which he expressed in the *Defensio Secunda*. Above all, he was disappointed with Cromwell's church policy. Milton was strongly for complete disestablishment, and Cromwell's conservation of the Established Church must have been Milton's deepest disappointment with Cromwell's rule.

Cromwell's death on Sept. 3, 1658 left the Protectorship to his son Richard. Milton and Marvell, now his assistant secretary, continued in their posts, and a number of the Foreign Office letters of the new Protectorate were of Milton's composition. In Oct. 1658 appeared a new edition of his *Defensio prima*, and, early in 1659, a new English pamphlet, entitled *Treatise of Civil Power in Ecclesiastical Causes showing that it is not lawful to compel in Matters of Religion*, in which he advocated the separation of Church and State. To Richard's Protectorate also belongs one of Milton's Latin "Familiar Epistles."

His last work for the Commonwealth was a desperate struggle to avert the restoration of the monarchy. In a *Letter to a Friend concerning the Ruptures of the Commonwealth*, written in Oct. 1659, he had propounded a scheme of a kind of dual government for reconciling the army chiefs with the Rump; through the following winter, marked only by two of his Latin "Familiar Epistles," his anxiety over the signs of the growing enthusiasm

throughout the country for the recall of Charles II. had risen to a passionate vehemence which found vent in a pamphlet entitled *The Ready and Easy Way to Establish a Free Commonwealth, and the Excellence thereof compared with the Inconveniences and Dangers of readmitting Kingship to this Nation.* An abridgment of this pamphlet was addressed by him to General Monk in a letter entitled "The Present Means and Brief Delineation of a Free Commonwealth" (March 1660). Milton's proposal was that the central governing apparatus of the British Islands for the future should consist of one indissoluble grand council or parliament, which should include all the political chiefs, while there should be a large number of provincial councils or assemblies sitting in the great towns for the management of local and county affairs.

Not even when the king's cause was practically assured would Milton be silent. In *Brief Notes upon a late Sermon* (April 1660) he made another protest against the recall of the Stuarts, and in the same month he sent forth a second edition of his *Ready and Easy Way*, containing additional passages of the most violent denunciation of the royal family, and of prophecy of the degradation and disaster they would bring back with them. This was the dying effort. Charles II. returned to London on May 29, and by then the chief republicans had scattered themselves, and Milton was hiding in an obscure part of the city.

After the Restoration.—How Milton escaped the scaffold at the Restoration is a mystery now, and was a mystery at the time. The Commons voted that he should be taken into custody by the serjeant-at-arms, for prosecution by the attorney-general on account of his *Eikonoklastes* and *Defensio prima*, and that all copies of those books should be called in and burnt by the hangman. There was a story that Milton had once protected Davenant and now owed his immunity to him; but it is more likely that he was protected by the influence of Marvell, by Arthur Annesley, afterwards earl of Anglesey, and by other friends who had influence at court. At all events, on Aug. 29, 1660, when the Indemnity Bill did come out complete, with the king's assent, Milton did not appear as one of the exceptions on any ground or in any of the grades. He was actually taken into custody, though the prosecution was quashed by the Indemnity Bill, and complained to the Commons of the fee charged for his release.

Milton did not return to Petty France. For the first months after he was free he lived as closely as possible in a house near what is now Red Lion square, Holborn. Thence he removed, apparently early in 1661, to a house in Jewin street, in his old Aldersgate street neighbourhood. In Jewin street Milton remained for two or three years, or from 1661 to 1664. This is the time of which he says:—

> . . . though fallen on evil days,
> On evil days though fallen, and evil tongues,
> In darkness, and with dangers compassed round,
> And solitude.

The "evil days" were those of the Restoration in its first or Clarendonian stage, with its revenges and reactions, its open proclamation and practice of anti-Puritanism in morals and in literature no less than in politics. His few friends were mostly Nonconformists of some denomination, who were themselves under similar obloquy. Besides his two nephews, the faithful Andrew Marvell, Cyriack Skinner and some others of his former admirers, we hear chiefly of a Dr. Nathan Paget and of several young men who would drop in upon him by turns, partly to act as his amanuenses, and partly for the benefit of lessons from him —one of them a Quaker youth, named Thomas Ellwood. His three daughters, on whom he ought now to have been able principally to depend, were his most serious domestic trouble. The poor motherless girls, the eldest in her 17th year in 1662, the second in her 15th and the youngest in her 11th, had grown up, in their father's blindness and too great self-absorption, ill-looked-after and but poorly educated; and the result now appeared. They "made nothing of neglecting him"; they rebelled against the drudgery of reading to him or otherwise attending on him; they "did combine together and counsel his maid-servant to cheat him in her marketings"; they actually "had made away some of his books, and would have sold the rest."

It was to remedy this state of things that Milton consented to a third marriage. On Feb. 24, 1662/3 he married Elizabeth Minshull, a relative of Dr. Paget. She proved an excellent wife, and the Jewin street household, though the daughters remained in it, must have been under better management from the time of her entry into it. Meanwhile, he had been building up his *Paradise Lost.* He had begun the poem in earnest, we are told, in 1658 at his house in Petty France. He had made but little way when there came the interruption of the Restoration; but the work had been resumed in Jewin street and prosecuted there steadily, by dictations of 20 or 30 lines at a time to whatever friendly or hired amanuensis chanced to be at hand. Considerable progress had been made in this way before his third marriage; and after that the work proceeded apace, his nephew, Edward Phillips, who was then out in the world on his own account, looking in when he could to revise the growing manuscript.

Not very long after the third marriage, probably in 1664, he removed to another house, with a garden, in "Artillery Walk, leading to Bunhill Fields." Here *Paradise Lost* was certainly finished before July 1665—Aubrey says in 1663—for when Milton and his family, to avoid the Great Plague of London, went into temporary country-quarters in a cottage in Chalfont St. Giles, Buckinghamshire (Milton's cottage here is still standing, and is open to visitors), the finished manuscript was taken with him. This we learn from Thomas Ellwood, who had taken the cottage for him, and was allowed to take a copy of the manuscript away with him for perusal, during Milton's stay at Chalfont (*Life of Thomas Ellwood,* 1714). On April 27, 1667 Milton concluded an agreement, still preserved in the British Museum, with Samuel Simmons, printer, of Aldersgate street, London, to dispose of the copyright for £5 down, the promise of another £5 after the sale of the first edition of 1,300 copies, and the further promise of two additional sums of £5 each after the sale of two more editions of the same size respectively. The poem was entered in the Stationers' Registers on Aug. 20 following, and shortly after that date it was out in London as a neatly printed small quarto, with the title *Paradise Lost: A Poem written in Ten Books: By John Milton.* The sale of an edition of 1,300 copies in 18 months proves that the poem found a wide circle of readers. "This man cuts us all out, and the ancients too," is the saying attributed to Dryden on the occasion; and it is the more remarkable because the one objection to the poem which at first, we are told, "stumbled many" must have "stumbled" Dryden most of all. Except in the drama, rhyme was then thought essential in anything professing to be a poem; blank verse was hardly regarded as verse at all; Dryden especially had been and was the champion of rhyme, contending for it even in the drama. That, notwithstanding this obvious blow struck by the poet at Dryden's pet literary theory, he should have welcomed the poem so enthusiastically and proclaimed its merits so emphatically, says much at once for his critical perception and for the generosity of his temper. According to Aubrey, Dryden requested Milton's leave to turn the poem into a rhymed drama, and was told he might "tag his verses if he pleased." The result is seen in Dryden's opera, *The State of Innocence and the Fall of Man* (1675). One consequence of Milton's renewed celebrity was that visitors of all ranks again sought him out for the honour of his society and conversation. His obscure house in Artillery Walk, Bunhill, we are told, became an attraction now, "much more than he did desire," for the learned notabilities of his time.

Last Years.—Accounts have come down to us of Milton's personal appearance and habits in his later life. They describe him as to be seen every other day led about in the streets in the vicinity of his Bunhill residence, a slender figure, of middle stature or a little less, generally dressed in a grey cloak or overcoat, and wearing sometimes a small silver-hilted sword, evidently in feeble health, but still looking younger than he was, with his lightish hair, and his fair, rather than aged or pale, complexion. He would sit in his garden at the door of his house, in warm weather, in the same kind of grey overcoat, "and so, as well as in his room, received the visits of people of distinguished parts, as well as quality." Within doors he was usually dressed in neat black.

He was a very early riser, and very regular in the distribution of his day, spending the first part, to his midday dinner, always in his own room, amid his books, with an amanuensis to read for him and write to his dictation. Music was always a chief part of his afternoon and evening relaxation, alike when he was by himself or when friends were with him. His manner with friends and visitors was extremely courteous and affable, with just a shade of stateliness. In free conversation, either at the midday dinner, when a friend or two happened, by rare accident, to be present, or more habitually in the evening and at the light supper which concluded it, he was the life and soul of the company, from his "flow of subject" and his "unaffected cheerfulness and civility," though with a marked tendency to the satirical and sarcastic in his criticisms of men and things. This tendency to the sarcastic was connected by some of those who observed it with a peculiarity of his voice or pronunciation. "He pronounced the letter *r* very hard," Aubrey tells us, adding Dryden's note on the subject: "*litera canina*, the dog-letter, a certain sign of a satirical wit." He was extremely temperate in the use of wine or any strong liquors, at meals and at all other times; and when supper was over, about nine o'clock, "he smoked his pipe and drank a glass of water, and went to bed." He suffered much from gout, the effects of which had become apparent in a stiffening of his hands and finger-joints, and the recurring attacks of which in its acute form were very painful. His favourite poets among the Greeks were Homer and the Tragedians, especially Euripides; among the Latins, Virgil and Ovid; among the English, Spenser and Shakespeare. Among his English contemporaries, he thought most highly of Cowley. He had ceased to attend any church, belonged to no religious communion, and had no religious observances in his family. His reasons for this were a matter for curious surmise among his friends, because of the profoundly religious character of his own mind; but he does not seem ever to have furnished the explanation. The matter became of less interest perhaps after 1669, when his three daughters ceased to reside with him, having been sent out "to learn some curious and ingenious sorts of manufacture that are proper for women to learn, particularly embroideries in gold or silver." After that the household in Bunhill consisted only of Milton, his wife, a single maid-servant, and the "man" or amanuensis who came in for the day.

In 1669 he published *Accedence commenced Grammar*, and in 1670 his *History of Britain . . . to the Norman Conquest*, and a Latin digest of Ramist logic, entitled *Artis logicae plenior institutio*. In 1671 there followed his *Paradise Regained* and *Samson Agonistes*, bound together in one small volume, and giving ample proof that his poetic genius had not exhausted itself in the preceding great epic. In 1673, Milton ventured on the dangerous experiment of one more political pamphlet, in which, under the title *Of True Religion*, he put forth, with a view to popular acceptance, as mild a version as possible of his former principles on the topics discussed. In the same year appeared the second edition of his *Poems . . . both English and Latin*, which included, with the exception of the Sonnets to Cromwell, Fairfax, Vane and the second address to Cyriack Skinner, all the minor poems.

In 1674 the second edition of *Paradise Lost*, in 12 books instead of 10, appeared, and his *Epistolae Familiares*, together with his Cambridge *Prolusiones*. On Nov. 8, 1674, Milton died, in his house in Bunhill, of "gout struck in," at the age of 65 years and 11 months. He was buried, the next Thursday, in the church of St. Giles, Cripplegate, beside his father; a considerable concourse attending the funeral.

Posthumous Publications.—Of masses of manuscript that had been left by Milton, some portions saw the light posthumously. Prevented in the last year of his life from publishing his Latin *State Letters* in the same volume with his Latin *Familiar Epistles*, he had committed the charge of the *State Letters*, prepared for the press, together with the completed manuscript of his Latin *Treatise of Christian Doctrine*, to a young Cambridge scholar, Daniel Skinner, who had been among the last of his amanuenses, and had, in fact, been employed by him especially in copying out and arranging those two important mss. Negotiations were on foot, after Milton's death, between this Daniel Skinner and the Amsterdam printer, Daniel Elzevir, for the publication of both mss., when the English government interfered, and the mss. were sent back by Elzevir, and thrown aside, as dangerous rubbish, in a cupboard in the State Paper Office. Meanwhile, in 1676, a London bookseller, named Pitt, who had somehow got into his possession a less perfect, but still tolerably complete, copy of the *State Letters*, had brought out a surreptitious edition of them, under the title *Literae pseudo-senatus anglicani, Cromwellii . . . nomine et jussu conscriptae a Joanne Miltono*. No other posthumous publications of Milton's appeared till 1681, when another bookseller put forth a slight tract entitled *Mr. John Milton's Character of the Long Parliament and Assembly of Divines*, in 1641, consisting of a page or two, of rather dubious authenticity, said to have been withheld from his *History of Britain* in the edition of 1670. In 1682 appeared *A Brief History of Moscovia, and of other less-known Countries lying Eastward of Russia as far as Cathay . . .* undoubtedly Milton's, and a specimen of those prose compilations with which he sometimes occupied his leisure. Of the fate of his collections for a new Latin *Dictionary*, which had swelled to three folio volumes of ms., all that is known is that, after having been used by Edward Phillips for his *Enchiridion* and *Speculum*, they came into the hands of a committee of Cambridge scholars, and were used for that Latin dictionary of 1693, called *The Cambridge Dictionary*, on which Ainsworth's *Dictionary* was based. In 1698 there was published in three folio volumes, under the editorship of John Toland, the first collective edition of Milton's prose works, professing to have been printed at Amsterdam, though really printed in London. A very interesting folio volume, published in 1743 by "John Nickolls, junior," under the title of *Original Letters and Papers of State addressed to Oliver Cromwell*, consists of a number of intimate Cromwellian documents that had somehow come into Milton's possession immediately after Cromwell's death, and were left by him confidentially to the Quaker Ellwood. Finally, a chance search in the London State Paper Office in 1823 having discovered the long-lost parcel containing the mss. of Milton's Latin *State Letters* and his Latin *Treatise of Christian Doctrine*, as these had been sent back from Amsterdam a hundred and fifty years before, the *Treatise of Christian Doctrine* was, by the command of George IV., edited and published in 1825 by the Rev. C. R. Sumner, under the title of *Joannis Miltoni Angli de doctrina christiana libri duo posthumi*. An English translation, by the editor, was published in the same year. Those state papers of Milton which had not been already printed were edited by W. D. Hamilton for the Camden Society, in 1859.

Milton as Writer.—Milton's literary life divides into three almost mechanically distinct periods: (1) the time of his youth and minor poems, (2) his middle twenty years of prose polemics, and (3) the time of his later Muse and greater poems.

Had Milton died in 1640, when he was in his thirty-second year, and had his literary remains been then collected, he would have been remembered as one of the best Latinists of his generation and one of the most exquisite of minor English poets. In the latter character, more particularly, he would have taken his place as one of that interesting group or series of English poets, coming in the next forty years after Spenser, who, because they all acknowledged a filial relationship to Spenser, may be called collectively the Spenserians. In this group Milton would have been entitled, by the small collection of pieces he had left, and which would have included his *Ode on the Nativity*, his *L'Allegro* and *Il Penseroso*, his *Comus* and his *Lycidas*, to recognition as indubitably the very highest and finest. There was in him that peculiar Spenserian something which might be regarded as the poetic faculty in its essence, with a closeness and perfection of verbal finish not to be found in the other Spenserians, or even in the master himself. But owning discipleship to Spenser as the author did, he was a Spenserian with a difference belonging to his own constitution—which prophesied the passage of English poetry out of the Spenserian into a kind that might be called the Miltonic. This Miltonic something, distinguishing the new

poet from other Spenserians, was more than mere perfection of literary finish. It consisted in an avowed consciousness already of the *os magna soniturum*, "the mouth formed for great utterances," that consciousness resting on a peculiar substratum of personal character that had occasioned a new theory of literature. "He who would not be frustrate of his hope to write well hereafter on laudable things ought himself to be a true poem" was Milton's own memorable expression afterwards of the principle that had taken possession of him from his earliest days; and this principle of moral manliness as the true foundation of high literary effort, of the inextricable identity of all literary productions in kind, and their coequality in worth, with the personality in which they have their origin, might have been detected, in more or less definite shape, in all or most of the minor poems. It is a specific form of that general Platonic doctrine of the invincibility of virtue which runs through his *Comus*.

That a youth and early manhood of such poetical promise should have been succeeded by twenty years of all but incessant prose polemics has been a matter of regret with many. But this is to ignore his political and social side. Milton was not only the greatest pamphleteer of his generation—head and shoulders above the rest—but there is no life of that time, not even Cromwell's, in which the history of the great Revolution in its successive phases, so far as the deep underlying ideas and speculations were concerned, may be more intimately and instructively studied than in Milton's. Then, on merely literary grounds, what an interest in those prose remains! From the entire series there might be a collection of specimens, unequalled anywhere else, of the capabilities of that older, grander and more elaborate English prose of which the Elizabethans and their immediate successors were not ashamed.

While it is wrong to regard Milton's middle twenty years of prose polemics as a degradation of his genius, who does not exult in the fact that such a life was rounded off by a final stage of compulsory calm, when the "singing robes" could be resumed, and *Paradise Lost, Paradise Regained* and *Samson Agonistes* could issue in succession from the blind man's chamber? Of these three poems, and what they reveal of Milton, no need here to speak at length. *Paradise Lost* is one of the few monumental works of the world, with nothing in modern epic literature comparable to it except the great poem of Dante. This is best perceived by those who penetrate beneath the beauties of the merely terrestrial portion of the story, and who recognize the coherence and the splendour of that vast symbolic phantasmagory by which, through the wars in heaven and the subsequent revenge of the expelled archangel, it paints forth the connection of the whole visible universe of human cognisance and history with the grander, pre-existing and still environing world of the eternal and inconceivable. To this great epic *Paradise Regained* is a sequel, and it ought to be read as such. The best critical judgment now pronounces *Paradise Regained* to be not only, within the possibilities of its briefer theme, a worthy sequel to *Paradise Lost,* but also one of the most artistically perfect poems in any language. Finally the poem in which Milton bade farewell to the Muse, and in which he reverted to the dramatic form, proves that to the very end his right hand had lost none of its power or cunning. *Samson Agonistes* is the most powerful drama in the English language after the severe Greek model, and it has the additional interest of being so contrived that, without any deviation from the strictly objective incidents of the Biblical story which it enshrines, it is yet the poet's own epitaph and his condensed autobiography.

Much light is thrown upon Milton's mind in his later life, and even upon the poems of that period, by his posthumous Latin *Treatise of Christian Doctrine.* It differs from all his other prose writings of any importance in being cool, abstract and didactic. Professing to be a system of divinity derived directly from the Bible, it is really an exposition of Milton's metaphysics and of his reasoned opinions on all questions of philosophy, ethics and politics. The general effect is to show that, though he is rightly regarded as the very genius of English Puritanism, its representative poet and idealist, yet he was not a Puritan of what may be called the first wave, or that wave of Calvinistic orthodoxy which broke in upon the absolutism of Charles and Laud, and set the English Revolution agoing. He belonged distinctly to that larger and more persistent wave of Puritanism which, passing on through Independency, and an endless variety of sects, many of them rationalistic and freethinking in the extreme, developed into what has ever since been known as English Liberalism. The treatise makes clear that, while Milton was a most fervid theist and a genuine Christian, believing in the Bible, and valuing the Bible over all the other books in the world, he was at the same time one of the most intrepid of English thinkers and theologians.

Bibliography.—Mss. of the poems of Milton's earlier period in his own handwriting are preserved in the library of Trinity college, Cambridge. These are not enumerated among the gifts made by Sir Henry Newton Puckering in 1691, but presumably belonged to him, and came to the library at his death in 1700, as they were found by Charles Mason, a fellow of the college, among papers and books which had been his. They were bound in a folio volume by the care of Thomas Clarke, afterwards Master of the Rolls, in 1736. Besides the poems, with many interlineations and corrections, the ms. contains suggestions, and in some cases fully developed plans, for works generally dramatic in form. This manuscript volume, invaluable as an index to Milton's methods of work, was reproduced in facsimile (Cambridge, 1899) by W. Aldis Wright.

The first complete edition of *The Poetical Works of Mr. John Milton . . .* was printed by Jacob Tonson in 1695. In 1732 Richard Bentley put forward a curious edition of *Paradise Lost* in which long passages were rejected and placed in the margin on the ground that they were interpolations made possible by Milton's blindness. The Latin and Italian poems, with a translation by William Cowper, were printed by W. Hayley in 1808. The most important of the numerous later editions of Milton's poetical works are by H. J. Todd (6 vols., 1801); J. Mitford ("Aldine edition," 3 vols., 1832); T. Keightley (2 vols., 1859), whose notes are most original and interesting; D. Masson ("Library" or "Cambridge" edition, 3 vols., 1874; of which a new edition appeared in 1890, with memoir, introduction, notes and an essay on Milton's English and versification); John Bradshaw (new "Aldine edition," 2 vols., 1892); also a careful reprint retaining the peculiarities of the earlier printed copies, by H. C. Beeching ("Oxford edition," 1904); and another, with variant readings, by W. Aldis Wright (Cambridge University Press, 1903). The prose works were first partially collected in 1697. They were edited by J. Toland (3 vols., 1698), by C. Symmons (7 vols., 1806), by Pickering (8 vols., 1851) with the poetical works, and by J. A. St. John for Bohn's "Libraries" (5 vols., 1848–53). There are numerous annotated editions of separate works.

The earliest life of Milton is contained in Wood ms. D. 4 in the Bodleian library, Oxford, and was printed in the *Eng. Hist. Review* for January 1902, also by E. S. Parsons in *Colorado College Studies*, No. X. (1903). The author, who sympathized with the poet's political views, is unknown, but the name of Milton's friend, Dr. Nathan Paget, is suggested. His account formed the basis of the life given by Anthony à Wood in *Fasti oxonienses* (1691). Wood was also indebted to John Aubrey, whose *Brief Lives* were not printed until later. The life by his nephew Edward Phillips was prefixed to the *Letters of State* printed in 1694, and reprinted by William Godwin in his *Lives of E. and J. Phillips* (1815). Samuel Johnson's famous *Life of Milton* (1779), which contains some valuable criticism, is written from a somewhat unfriendly standpoint. The records of Milton's official life, available in the State Papers, were first made use of by H. J. Todd in a third edition (1829) of his *Milton.* All the available information was gathered in Professor Masson's *Life of John Milton; narrated in Connexion with the Political, Ecclesiastical and Literary History of his Time* (6 vols., 1859–80, with index, 1894; new ed. of vol. i., 1881) which contains ample reference to original authorities. Shorter works are *Milton und seine Zeit* (2 pts., 1877, 1879), by Alfred Stern; *Milton* (1879), by Mark Pattison in the "English Men of Letters" series, and *Life of John Milton* (1890) by Dr. Richard Garnett in the "Great Writers" series, with a bibliography by J. P. Anderson. W. H. Huline, *Two early lives of Milton* (1924), contains lives by Toland and Fenton. A valuable contribution to Miltonic criticism was made in 1893 by Robert Bridges in an essay on *Milton's Prosody.* This was reprinted in 1901 (new ed. 1921). Amongst other critical essays should be mentioned essays by Macaulay (*Edinburgh Review,* 1825); Walter Bagehot (*Literary Studies,* vol. i., 1879); S. T. Coleridge (*Seven Lectures on Shakespeare and Milton,* 1856); Edward Dowden (*Transcripts and Studies,* 1888); Edmond Scherer (*Études sur la littérature contemporaine,* vol. vi., 1882); Augustine Birrell (*Obiter dicta,* second series 1887); Walter Raleigh (*Milton,* 1900); E. Allodoli, *Giovanni Milton e l'Italia* (Prato, 1907); N. G. Tarrant, *John Milton* (1908); R. O. Havens, *Influence of Milton in English Poetry* (1922); W. Harris, *John Milton* (2nd ed. 1923); J. Langdon, *Milton's Theory of Poetry and Fine Art* (1924); D. Saurat, *Milton, Man and Thinker* (1925); J. H. Hanford, *A Milton Handbook* (1926); M. A. Larson, *The Modernity of Milton* (1927). (D. Ma.; X.)

MILTON, a town of Norfolk county, Massachusetts, U.S.A., 7 m. S. of Boston, on the Neponset river, and served by the New

York, New Haven and Hartford railroad. The population was 9,382 in 1920, 22% foreign-born white, and was 16,434 in 1930 by the Federal census. It covers 13 sq.m., embracing the villages of Milton, East Milton and Mattapan, and is primarily a residential suburb of Boston. It has several factories, and two quarries of dark bluish-grey granite, used chiefly for monuments. One of the public parks is part of the estate of Thomas Hutchinson, the last royal governor. On Great Blue hill (635 ft.), where great fires were kindled to celebrate important news and signal beacons were burned during the Revolution, is the Blue Hills observatory, established by Albert Lawrence Rotch, who used kites for securing meteorological data and made important studies of clouds. Milton was formed in 1662 from a part of Dorchester called Uncataquissett, which had been settled in 1640. On Sept. 9, 1774, at the home of Daniel Vose, a meeting (adjourned from Dedham) passed the bold "Suffolk Resolves," urging forcible opposition to Great Britain, if necessary.

MILTON, a borough of Northumberland county, Pennsylvania, U.S.A., on the Susquehanna river and the Susquehanna trail, 67 m. N. of Harrisburg. It is served by the Pennsylvania and the Reading railways and motor-bus lines. Pop. (1920) 8,638 and in 1930, 8,552. It is in a beautiful and productive region, and has important manufactures, including tank cars, fabricated steel, pressed steel products, hosiery, shirts, broad silk, cedar chests and dairy products. The borough (originally "Mill Town") was founded in 1792 and incorporated in 1817. A large part of the town was destroyed by fire in 1880.

MILWAUKEE, the largest city of Wisconsin, U.S.A., and the 12th in size in the United States (1930), on Lake Michigan, 85 m. N. of Chicago; a port of entry and the county seat of Milwaukee county. It is on Federal highways 16, 18, 41 and 141; has municipal and commercial airports; and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, North Shore and Milwaukee, the Grand Trunk, the Pere Marquette, and the Soo Line railways, numerous motor coach and truck lines, and 9 lake steamship lines. Pop. (1920) 457,147 (110,160 foreign born, of whom 39,771 were from Germany and 23,060 from Poland; in 1930 it was 578,249.

The city has an area of 35 sq.m.; an altitude of 580 ft., rising to a height of 75 to 125 ft. above the level of the lake. Three rivers cut it into natural divisions, known as the east, the west and the south sides. The Milwaukee river, entering from the north, is joined half a mile from its mouth by the Menominee, flowing from the west, and nearer the lake by the Kinnickinnic, from the south, and empties into Milwaukee bay, about 6 m. wide. The rivers are navigable for lake traffic into the heart of the city. A large part of the lake front is owned by the city, and developed in parks, airport, and harbour facilities. The Court of Honor (dedicated to those who have taken part in the wars of America) is a broad parked space extending for three blocks on Wisconsin avenue, past the public library and museum, several fine churches, and other important buildings. In the heart of the city is the vast municipal auditorium, comprising 8 halls (seating from 300 to 8,000) under one roof, and providing over 95,000 sq.ft. of exhibition space. The 40 hotels have 5,500 guest-rooms, and the office buildings, department stores, and other business structures are for the most part large and of modern type. The park system covers 1,000 ac. and includes provision for all the popular games and recreations. Additional playgrounds are maintained by the school board. Under the forestry division of the park department, the systematic planting of shade trees and shrubs in the city streets is carried on, and existing trees are pruned, sprayed, moved when necessary, and removed when dead or diseased. In the first ten years after the creation (1918) of this service, 25,000 new trees were planted.

Education and Charities.—The public school system includes 80 elementary and 8 general high schools, two technical high schools, a trade school for girls and one for boys (the latter providing a Mechanics Institute for men), and a part-time vocational school which has an attendance of 12,000. The parochial schools number 101. The public library and museum contain 680,000 volumes, and an excellent collection of historic relics and of material illustrating the natural sciences. The city maintains one of the largest zoological gardens in the country. There is a municipal art institute, and the Layton Art gallery has one of the best collections of paintings west of the Alleghenies. The Germans who played so large a part in building up the city are represented (among many other reminders) by numerous musical societies and *turnvereins*. Milwaukee is the seat of a State normal school (established 1880); Milwaukee-Downer college for women (formed in 1895 by the consolidation of Milwaukee college and Downer college, a Baptist institution established at Fox Lake in 1855); Marquette university (Roman Catholic; 1881) which has one of the largest dental schools in the country; the Milwaukee School of Engineering (1905); the Wisconsin Workshop for the Blind; the Wisconsin Industrial School for Girls (to be moved about 1930); and numerous private schools and charitable institutions under religious auspices. Just west of the city is a group of county institutions for the care of the aged, infirm, insane and dependent. On the south-west outskirts is a branch of the national home for disabled and tuberculous army veterans. The privately supported philanthropic agencies of the city raise their funds in a joint annual campaign. Eight daily papers are published in the city, including one German and two Polish. The general death rate and the infant mortality are low.

Government.—The city operates under a charter of 1874, providing for a municipal form of government, with a mayor and board of aldermen elected biennially. The budget system has been in use since 1913. The water supply is taken from Lake Michigan, at a point 5 m. from the harbour. The two pumping stations have a capacity of 219,000,000 gal. in 24 hours, about three times the daily average consumption in 1927. The entire cost of the water works ($16,000,000) has been paid out of earnings of the department. In 1925 a sewage disposal system was completed at a cost of $8,500,000. It is based on the activated sludge process, by which fertilizer material of commercial value is produced, covering about two-thirds of the operating expense. The city's assessed valuation of property for 1928 was $1,181,899,550. Exempt property was valued at $191,435,264, and public utilities at $128,440,000. A comprehensive city plan was prepared in 1917 but has not yet (1928) been formally adopted. Zoning ordinances were enacted in 1920 and 1924.

Commerce and Manufactures.—Milwaukee is the commercial metropolis of the State, and ranked 11th in 1925 among the cities of the United States in the value of its manufactured products. Its fine harbour, open throughout the year and accessible to the largest craft on the lakes, is the most important gateway to the North-west for traffic across Lake Michigan. The water-borne commerce amounted in 1927 to 8,233,198 tons, valued at $466,726,000, of which entire total 66% (in value) was car-ferry traffic, and the rest general vessel cargo, largely coal and grain. Milwaukee is one of the great grain ports of the Great Lakes and one of the largest distributing centres for coal in the country. Its commerce is domestic for the most part. Exports to foreign countries were valued in 1927 at $43,676,422, and imports at $6,813,084. The aggregate jobbing and wholesale business of the city for 1926 was estimated at $170,000,000. Bank debits in 1927 amounted to $3,699,524,000.

The manufactures of the city are many and varied. The large brewing industry for which it was famous was dissipated by the national legislation following the adoption of the 18th amendment to the Constitution; but even at its height the manufacture of beer was less important than many of its other industries. In the year ending June 30, 1918, just before the prohibitory legislation, the output of the breweries was 2,900,000 bbl., valued at $22,500,000, but this was probably less than 4% of the aggregate output of all the factories. The total factory product in 1927 was valued at $627,415,824. Chief among the manufactures are heavy machinery (cranes and hoists, steam shovels, excavators and dredges, steam and water turbines, hydraulic electric units, rock and ore crushers, mining, milling, refrigerating and agricultural machinery of all kinds), tinware and enamelled ware, leather, motorcycles and automobile frames, steel wheelbarrows, work shoes, silk stockings, toilet soaps, doll carriages, candy, leather

gloves, trunks and soft drinks Milwaukee shovels dug the Panama canal and the great open-pit iron mines of Minnesota. The largest ore-crusher in the world (in operation in Chile), weighing 500 tons, was made in Milwaukee; as was the huge hydro-electric unit installed at Niagara Falls.

History.—In 1673 Father Marquette and Louis Joliet, returning to the mission of St. Francis Xavier at De Pere from their trip down the Mississippi, skirted the west shore of Lake Michigan in their canoes. Milwaukee bay is distinctly marked on the map attributed to Marquette which was discovered in a convent in Montreal and is now in the Jesuit college in that city. La Salle and his party probably stopped here on their way south in 1679, and the name first appears ("Millioke") in the Jesuit Relations of that year. This and the numerous other variants were attempts to transliterate the Indian name (meaning "good lands") of the village which the white men found here. The first Englishman known to have visited the spot was the adventurous trader, Alexander Henry, in 1760. There is record of a French fur-trading post in 1763. In 1795 Jacques Vieau established a permanent post for the North-Western Fur Company, which he seems to have kept up until it was superseded in 1820 by one belonging to Astor's American Fur Company. Vieau built a dwelling and a warehouse and engaged in extensive trading operations. In 1818 there arrived a young Frenchman, Laurent Solomon Juneau (1793–1856), who married one of Vieau's daughters and eventually bought out his business. The settlement was on the direct line of travel from Ft. Dearborn (Chicago) and Green Bay, and as soon as the Indian titles were extinguished by the treaties of 1831 and 1833 with the Menominee, colonists began to come to the neighbourhood. In 1833 Morgan L. Martin (1805–87) of Green Bay explored the harbour, made a map of the place, and entered into an agreement with Juneau and Michael Dousman for its development. A saw-mill was built in 1834. The east side was platted in the summer of 1835, and the west side a little later (by Byron Kilbourn). The rival settlements, officially Milwaukee East Side and Milwaukee West Side, were popularly known as Juneautown and Kilbourntown. A third, called Walker's Point, was established on the south side by George H. Walker. The east side and the west side towns had bitter quarrels, especially over the building of bridges, for their streets, having been surveyed independently, did not come out at the same point on the river. They were separately incorporated as townships of Milwaukee county in 1837, but in 1839 united as wards of the same village, each one keeping complete financial and administrative autonomy of its own affairs. Walker's Point was annexed as a third ward in 1845, and in 1846 the three were incorporated as the city of Milwaukee, of which Solomon Juneau was elected the first mayor. The first vessel anchored in Milwaukee bay in 1779. A Chicago packet entered the river in 1823. The first newspaper, the *Milwaukee Advertiser,* began publication on July 14, 1836, and a public school was opened in that year. In 1839 George Smith and Alexander Mitchell established the Fire and Marine Insurance Bank, which for 40 years was one of the strongest banking houses west of the Alleghenies. Its notes passed at par through panics under which even Government issues depreciated, and it financed the "Milwaukee" and other western railways. The first brewery was built in 1840, by Owens and Pawlett. Connection was established with Chicago by telegraph in 1849; by railway in 1856. About 1840 began a stream of immigration from Germany, which was accelerated by the revolutionary movements of 1848 and continued for half a century. In 1900, out of a total population of 285,315—53,854 had been born in Germany, and 151,045 more had one or both parents of German birth, making a total of 72% who were either German by birth or of the "first generation." The population of the city has grown steadily from the beginning. By 1860 it had reached the total of 45,246, and the increase in succeeding decades was 58%, 62%, 77%, 40%, 31%, and 22% for 1910–20.

MILYUKOV, PAUL NIKOLAYEVICH (1859–), Russian politician and historian, was born near St. Petersburg (Leningrad) on Jan. 27, 1859. He studied history and humanities at the University of Moscow, and received the degree of master in history for a learned work on the *State Economics of Russia in the First Quarter of the 18th Century.* His liberal opinions brought him into conflict with the educational authorities, and he was dismissed in 1895 after one of the ever-recurrent university "riots." After the meetings of the zemstvos in 1905 he became the political editor of the *Retch,* and helped to found the constitutional democratic party (Kadets). Milyukov became the leader of that party, although he was not elected a member of the first or the second Duma. When the tsar dissolved the first Duma he helped to draft the "Viborg manifesto," in which members of the Duma declared themselves ready to follow the people in resisting arbitrary rule. Milyukov did not sign, however, as he was not a member of the Duma, and escaped the persecution which accompanied the Stolypin reaction. He was elected to the third and the fourth Duma, and was a leader of the opposition.

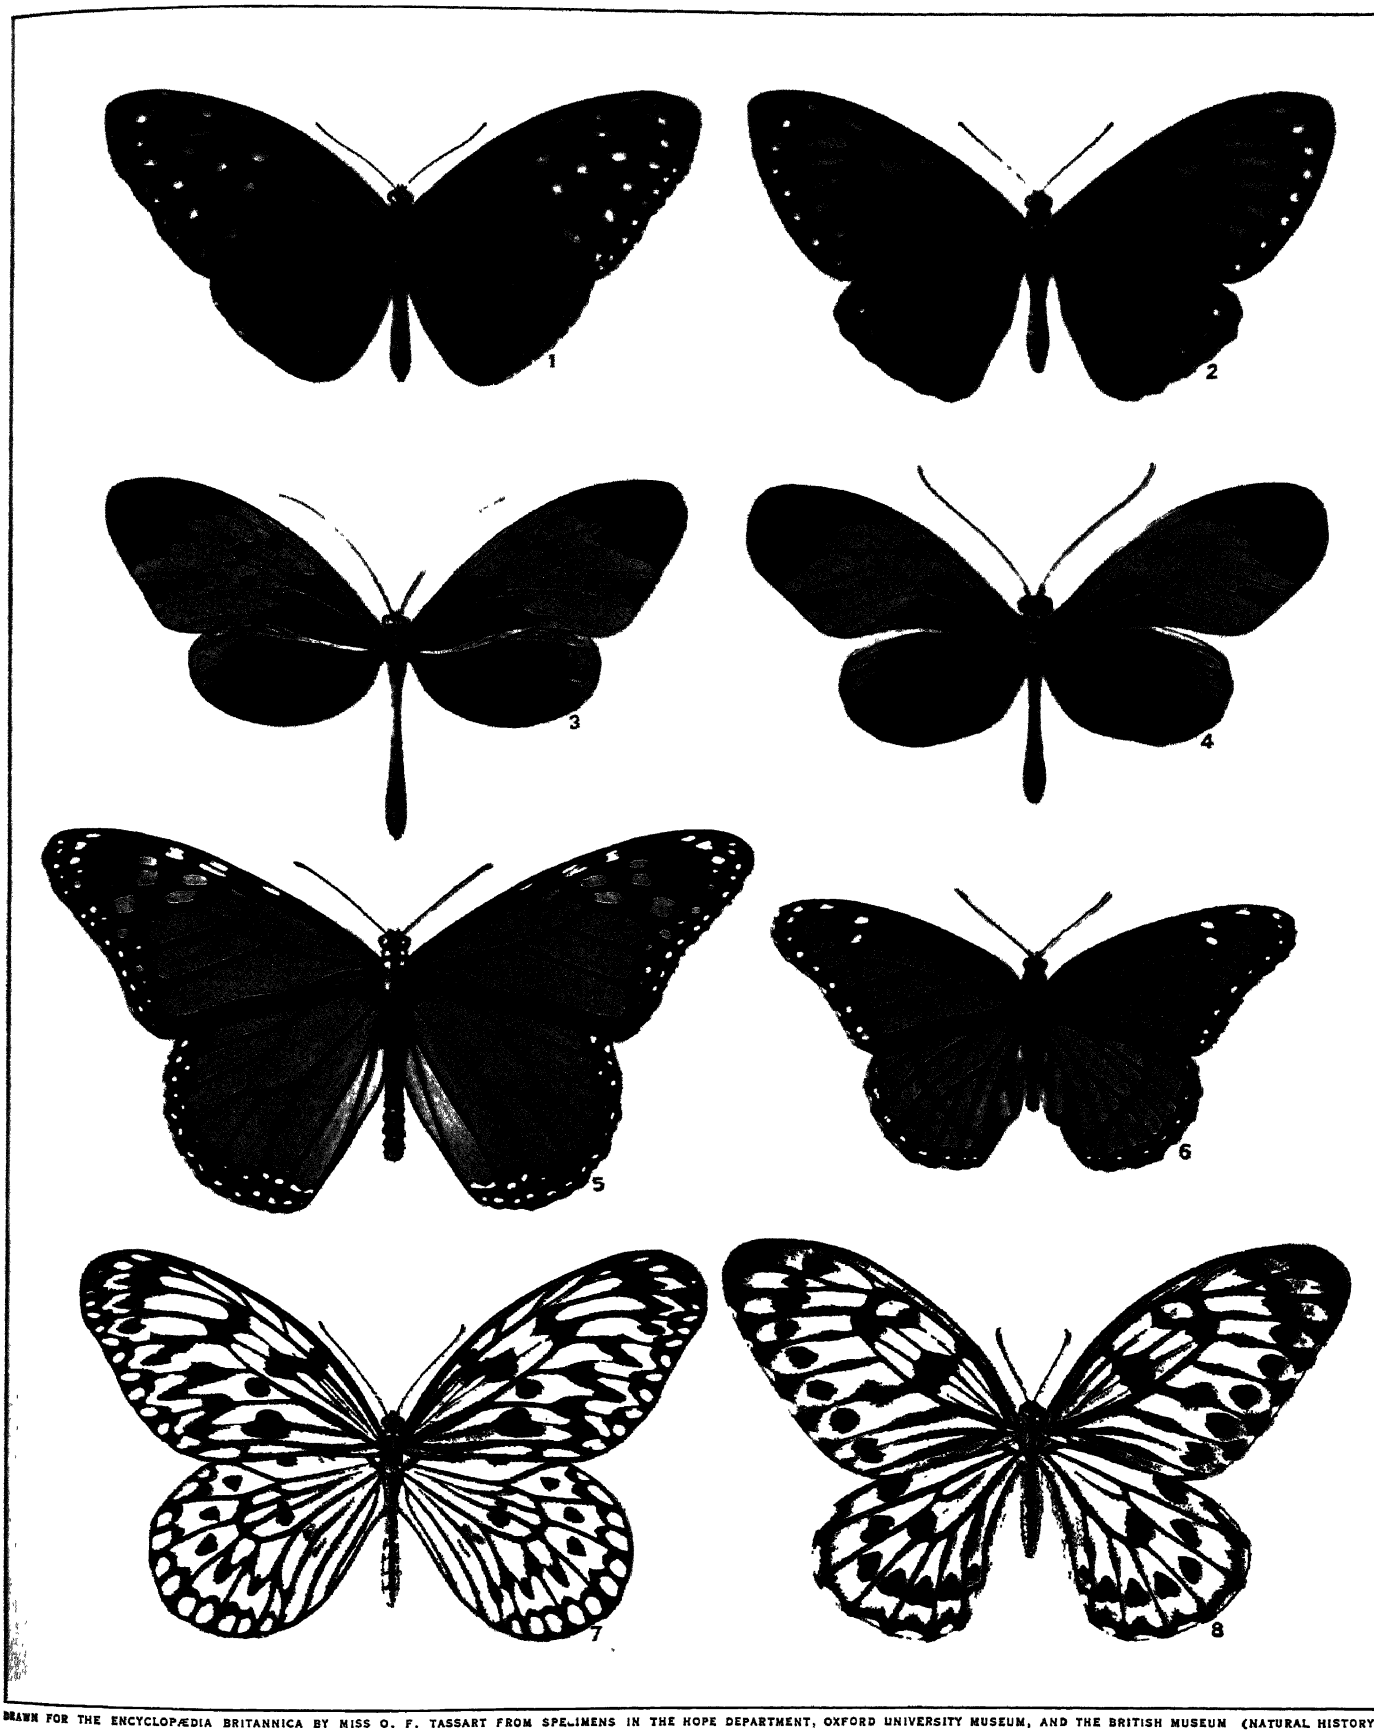
When the World War broke out he stood for a national union and for co-operation with the Entente, but the maladministration of the War Office drove him into an attitude of increasing hostility. Milyukov took office in Prince Lvov's provisional Government as minister of foreign affairs. When the Bolsheviks seized power he escaped to Kiev, then occupied by the Germans, and gave up the cause of the Allies as lost. After the Armistice Milyukov went to London and subsequently to Paris, where in 1921 he directed a journal (*Last News*) in which he advocated an alliance with patriotic Socialists.

His works include a *History of the Second Russian Revolution* (3 vols., 1921–23) and *Russia's Catastrophe* (2 vols., 1927).

MIME, an ancient Greek dramatic form in which the players portrayed events of everyday life, with the help of elaborate gestures; the name came to be applied also to the actors themselves. As literature, the mime developed in Sicily and southern Italy (5th century B.C.) through the prose of Sophron and Epicharmus, and later (3rd century B.C.) through the metric compositions of Herondas. The *mimus* found its way into Roman literature (1st century B.C.) through D. Labienus, Publius Syrus and others. For later growth and development *see* DRAMA; PANTOMIME.

MIMETITE, a mineral consisting of lead chloro-arsenate, $(PbCl)Pb_4(AsO_4)_3$, crystallizing in the hexagonal system and closely resembling pyromorphite (*q.v.*) in appearance and general characters. The arsenic is usually partly replaced by equivalent amounts of phosphorus, and there may thus be a gradual passage from mimetite to pyromorphite. The two species can, as a rule, only be distinguished by chemical analysis, and because of their close resemblance the less frequently occurring chloro-arsenate was named mimetite, or mimetesite, from Gr. μιμητής, imitator. Crystals of pyromorphite though usually optically uniaxial are sometimes biaxial, but in mimetite this anomalous character is almost always present; a cross-section of a hexagonal prism of mimetite shows a division into six optically biaxial sectors or a complex lamellated structure. In colour mimetite is usually yellow or brown, rarely white or colourless; the lustre is resinous to adamantine. The hardness is 3·5, and the specific gravity 7·0–7·25. Like pyromorphite, mimetite is found in the upper parts of veins of lead ore, where it has been formed by the oxidation of galena and mispickel. When found in large amount it is of importance as an ore of lead. The best crystallized specimens are those from Johanngeorgenstadt in Saxony, Wheal Unity in Cornwall, and Tsumeb in South-west Africa. It was formerly found in considerable amount at Dry Gill, Cumberland, as six-sided barrel-shaped crystals of a brownish-red or orange-yellow colour containing a considerable proportion of phosphoric acid; this variety has been called campylite (Gr. καμπύλος, curved), on account of the remarkable curvature of the faces of the crystals.

MIMICRY. The word Mimicry is applied by naturalists to certain advantageous resemblances between animals, and in some instances between plants. The resemblance of the common dead-nettle to the stinging nettle, with which it is commonly associated, is a good example of plant mimicry. These resemblances are independent of affinity, viz., they may exist between species of very different degrees of relationship, generally distant but sometimes near; they are such as appeal to the senses of enemies, especially to the sense of sight, not uncommonly to hearing, occasionally to



DRAWN FOR THE ENCYCLOPÆDIA BRITANNICA BY MISS O. F. TASSART FROM SPECIMENS IN THE HOPE DEPARTMENT, OXFORD UNIVERSITY MUSEUM, AND THE BRITISH MUSEUM (NATURAL HISTORY)

FOUR BUTTERFLIES AND THEIR MIMICS

Top row (left) The Danaid *Euploea midamus* and (right) its mimic *Papilio paradoxus* of Malaya

Second row (left) the Ithomiinae *Melinaea mothone* and (right) its Nymphalid mimic *Heliconius aristiona* both of Peru

Third row (left) the Danaid "Monarch" *Danaus plexippus* and (right) its mimic the Nymphalid "Viceroy" *Basilarchia archippus* both of North America

Fourth row (left) the Danaid *Hestia leuconoe* and (right) its mimic *Papilio idaeoides* both of the Philippines

smell and touch. They differ from the much larger class of Protective Resemblances in that these bring about concealment by a likeness to some object of no interest to enemies, whereas the true mimic resembles a conspicuous "model" feared or disliked by its enemies, and thus becomes conspicuous itself. Other differences have been suggested—that the mimic resembles an animal model and not the vegetable or mineral surroundings; that it resembles a moving and not a stationary object. These distinctions, although generally true, do not always hold. The resemblance of external parasites to the hair, feathers or skin of their host, and of many insects to the excrement of birds, snails or of other insects, and to empty snail-shells, is not mimicry but protective resemblance, which would also include those caterpillars whose curious swaying movements suggest a swinging fragment of twig, or butterflies and moths which float to the ground like a falling leaf or allow themselves to be driven like a leaf before the wind. Mimics are also commonly adapted to resemble their models in the position of rest as well as in flight.

Mimetic resemblances also differ from those which are an incidental result of similar functions, such as the general likeness in form between the racehorse and the greyhound or between the mole-like species with mole-like habits of life in the insectivores, rodents and marsupials; also from the incidental likeness between species which resemble the same part of their surroundings—sand, bark, leaves, etc. Mimetic resemblances differ from these in that they have been developed for the sake of the resemblance because of some advantage conferred in the struggle for existence. The term "mimicry," implying in its ordinary use conscious imitation, has been a source of confusion; it has now, however, a technical scientific meaning.

Other views as to the origin of these resemblances are:—that they are due (1) to the direct influence of the environment acting similarly on different species; (2) to a physiological response to constant mental experience such as colour sensation; (3) to sexual selection, modified by the presence of other types of colour. This last suggestion, due to Fritz Müller, is not supported by the fact that female butterflies are far more commonly mimetic than males.

The suggestion that these resemblances are a mere coincidence fails because of the evident geographical relationship. Mimics are found in the same localities as their models and when the latter are modified in various parts of their range the mimics change with them. There are however exceptions when the mimics are greater wanderers than their models, and in one remarkable example two butterflies in western China appear to be undoubted mimics of a model very common south of the Himalayas; here it is suggested that selection by migratory insectivorous birds may be influenced by their remembered experiences of the tropics.

Although mimetic resemblance is believed to exist in mammals, birds and fishes the number of examples is small and their interpretation often doubtful. Among reptiles poisonous snakes are mimicked by harmless species. Even the English grass-snake will often, when cornered, poise itself and strike like an adder. But for the study of the subject the insects are supreme, the small percentage of survival and swift succession of generations rendering natural selection peculiarly searching in its operation and rapid in its results.

DANAINE BUTTERFLIES

The figures on Plate I. illustrate facts consistent with the belief that mimicry is an advantageous resemblance and has been developed for its own sake—facts which are meaningless on any suggested interpretation except one based on selection. The butterflies most generally mimicked by species of other groups and by day-flying moths belong to a few dominant tropical sub-families, the Danainae and Acraeinae of the Old World, and, in the New, the Ithomiinae, allied to the first, and the Heliconinae allied to the second, together with very few Danainae and many Acraeinae. Now, however widely the types of pattern vary within each of these sub-families, they are still mimicked by butterflies of other groups and often by moths. The South American Acraeas have very different patterns from those of the African Acraeas, yet both are extensively mimicked. The most striking evidence is, however, supplied by the divergent colours and patterns of the Danaine models, of which a few examples are figured. The Oriental *Hestia* and its allies are large, black-and-white butterflies with thin papery wings. A characteristic example (*Hestia leuconoe*) from the Philippine islands and its swallowtail mimic (*Papilio idaeoides*) from the same locality are shown in the fourth row. In this and the following pair it must be borne in mind that the mimic is but a single example selected to represent many butterflies of different groups, and also day-flying moths, which mimic the same type of pattern in various parts of the Oriental region. In top row is the male of *Euploea midamus*, an example of a far more dominant and widespread Danaine type, that of the blue *Euploeas*, at its right is its swallowtail mimic (*Papilio paradoxus*). The originals of these two figures were both taken in the same part of the Malay peninsula. In Africa the Danaines are much less numerous but still supply the chief models for mimicry. The majority of the species belong to the genus *Amauris*, black butterflies with white or yellowish markings, very unlike the Oriental Danainae.

An entirely different type of Danaine pattern (third row, left) is borne by a series of nearly related species in the Oriental region, which must be regarded as the original home. This pattern is of especial interest for the present argument, because one species bearing it has migrated westward and become the chief model for mimicry in Africa, while two others have travelled eastward and become the ancestors of American species mimicked by indigenous American butterflies. In the third row is the best-known invader, *Danaus plexippus*, the monarch, the figured specimen, together with its mimic, the viceroy, having been caught near Chicago by the writer on Aug. 5, 1897. The mimic shown is a Nymphaline butterfly, *Basilarchia archippus*, closely related to the British white admiral and itself so recently descended from a North American white admiral that the two will interbreed and produce hybrid offspring. In all the earlier stages of its life-history the mimic remains a white admiral, the mimetic resemblance being restricted to the final colour and pattern. If, as some have supposed, mimetic likeness is the result of local influences, we should expect that the invader would have come to resemble the native rather than that the native should mimic the invader.

The above facts point directly to the conclusion that there is some advantage in mimicking Danaine butterflies, and, if space permitted, similar evidence could be brought forward to show that the widespread mimicry of the other great tropical groups is also advantageous. The proof becomes especially convincing in certain butterflies with many forms of female. Thus, three Uganda females of the African swallowtail *Papilio dardanus* mimic respectively three very different Danaine patterns, and the fourth an Acraeine; and in other parts of Africa where the Danaine patterns alter, and one of them or the Acraeine model is absent, we find that the corresponding female is similarly modified or wanting. In another African swallowtail, *Papilio cynorta*, the females mimic an Acraeine, changing geographically with the changes of the model. But in Abyssinia, where there is no appropriate model of this group, the female mimics a Danaine. All the local females of *P. dardanus* have often been bred, together with the non-mimetic males, from the eggs laid by a female of one form. From this it has been argued that they must have arisen suddenly from a female like the one found in Madagascar and Abyssinia and resembling the male. In recent years, however, numbers of intermediate females have been discovered and also bred in the Nairobi district. Furthermore the mimetic females which exist with the male-like females in Abyssinia, retain the "tails" on their hindwings which elsewhere have been lost by the fully formed mimics of the tailless Danaine and Acraeine models.

From these and many other examples it is evident that in butterflies the female is more commonly mimetic than the male. Furthermore when both sexes mimic, the female's likeness to a model is often the more complete. Apart from mimicry, female butterflies also appear in two or more forms far more commonly than males, and recent researches have shown that the females are more variable. It is therefore probable that the evolution of female mimicry has been facilitated by the quantity and variety of the material ready to be built up by natural selection.

Returning to a consideration of the advantages secured by mimicking the great tropical groups we find that their species possess conspicuous patterns made up of contrasted tints, the pattern of the under-surface of the wings being generally similar to that on the upper, so that when these butterflies fly with their characteristic flapping or sailing flight, or rest with wings closed, the colours and patterns, once learned, are easily recognized. Many of the species when disturbed emit an unpleasant odour which in some species is known to be secreted by special glands. When offered to insect-eating animals they are rejected except under the stress of hunger, and they have been seen to be attacked and rejected by enemies in the wild state. Their tissues are soft and flexible so that they can often recover from the injuries of experimental tasting. Just as these groups of butterflies are foremost in providing models for mimicry so are they conspicuous in the possession and in the advertisement of qualities which protect against attack. Mimicry of the advertisement suggests possession of the qualities. That young insect enemies do learn to associate the advertisement with the qualities has been proved by the interesting experiments of Lloyd Morgan. It must be remembered that the qualities are of the most varied kinds. Thus C. F. M. Swynnerton has shown that large African butterflies *Charaxes,* although palatable, are rejected because of their toughness, thus accounting for the mimetic likeness to them borne by smaller and less tough species of the genus; also for the resemblance of larger species to one another.

The two figures in the second row on Plate I. show that the species of the great tropical groups are not only mimicked by other butterflies but also that they mimic each other. Thus several African Acraeines mimic Danaines, while in both groups the species of one genus sometimes mimic those of another; the same is true of the Oriental Danaines. In tropical America the few Danaines and many of the Heliconines mimic species of the dominant group, the Ithomiines. This last mimetic association has been a fruitful source of confusion, for the superficial resemblance between the Ithomiines and an important section of the Heliconines is so strong that both groups were united under the Heliconidae by the older naturalists. And even when H. W. Bates recognized the wide difference between them he still left them as a single family divided into the Danaoid Heliconidae (the Ithomiinae) and the Acraeoid Heliconidae (the Heliconinae proper). Hence the models for mimicry, Ithomiine as well as Heliconine, are commonly called "Heliconidae." But in the meantime naturalists have recognized the true distinction, placing the two sections far apart, the Ithomiinae next to the Danainae, and the Heliconinae next to the Acraeinae. Now in the numerous mimetic associations between the two groups, the Ithomiinae, with hardly an exception, are the models and the Heliconinae the mimics. Thus the first figure in the second row represents the Ithomiine model, *Melinaea mothone,* and the second figure its beautiful Heliconine mimic *H. aristiona,* both from Peru. But as the latter is a Heliconine, it and other Heliconine mimics of Ithomiines are constantly referred to as models, thus reversing the true relationship, which is well shown by an exhibit, in the Oxford University museum, of the butterflies indiscriminately captured on two days in central British Guiana. There were taken on the first day 216 specimens of the chief Ithomiine model with *two* Heliconine mimics, belonging to different genera, on the second day six months later, of the model 220, and no mimic.

BATESIAN AND MÜLLERIAN MIMICRY

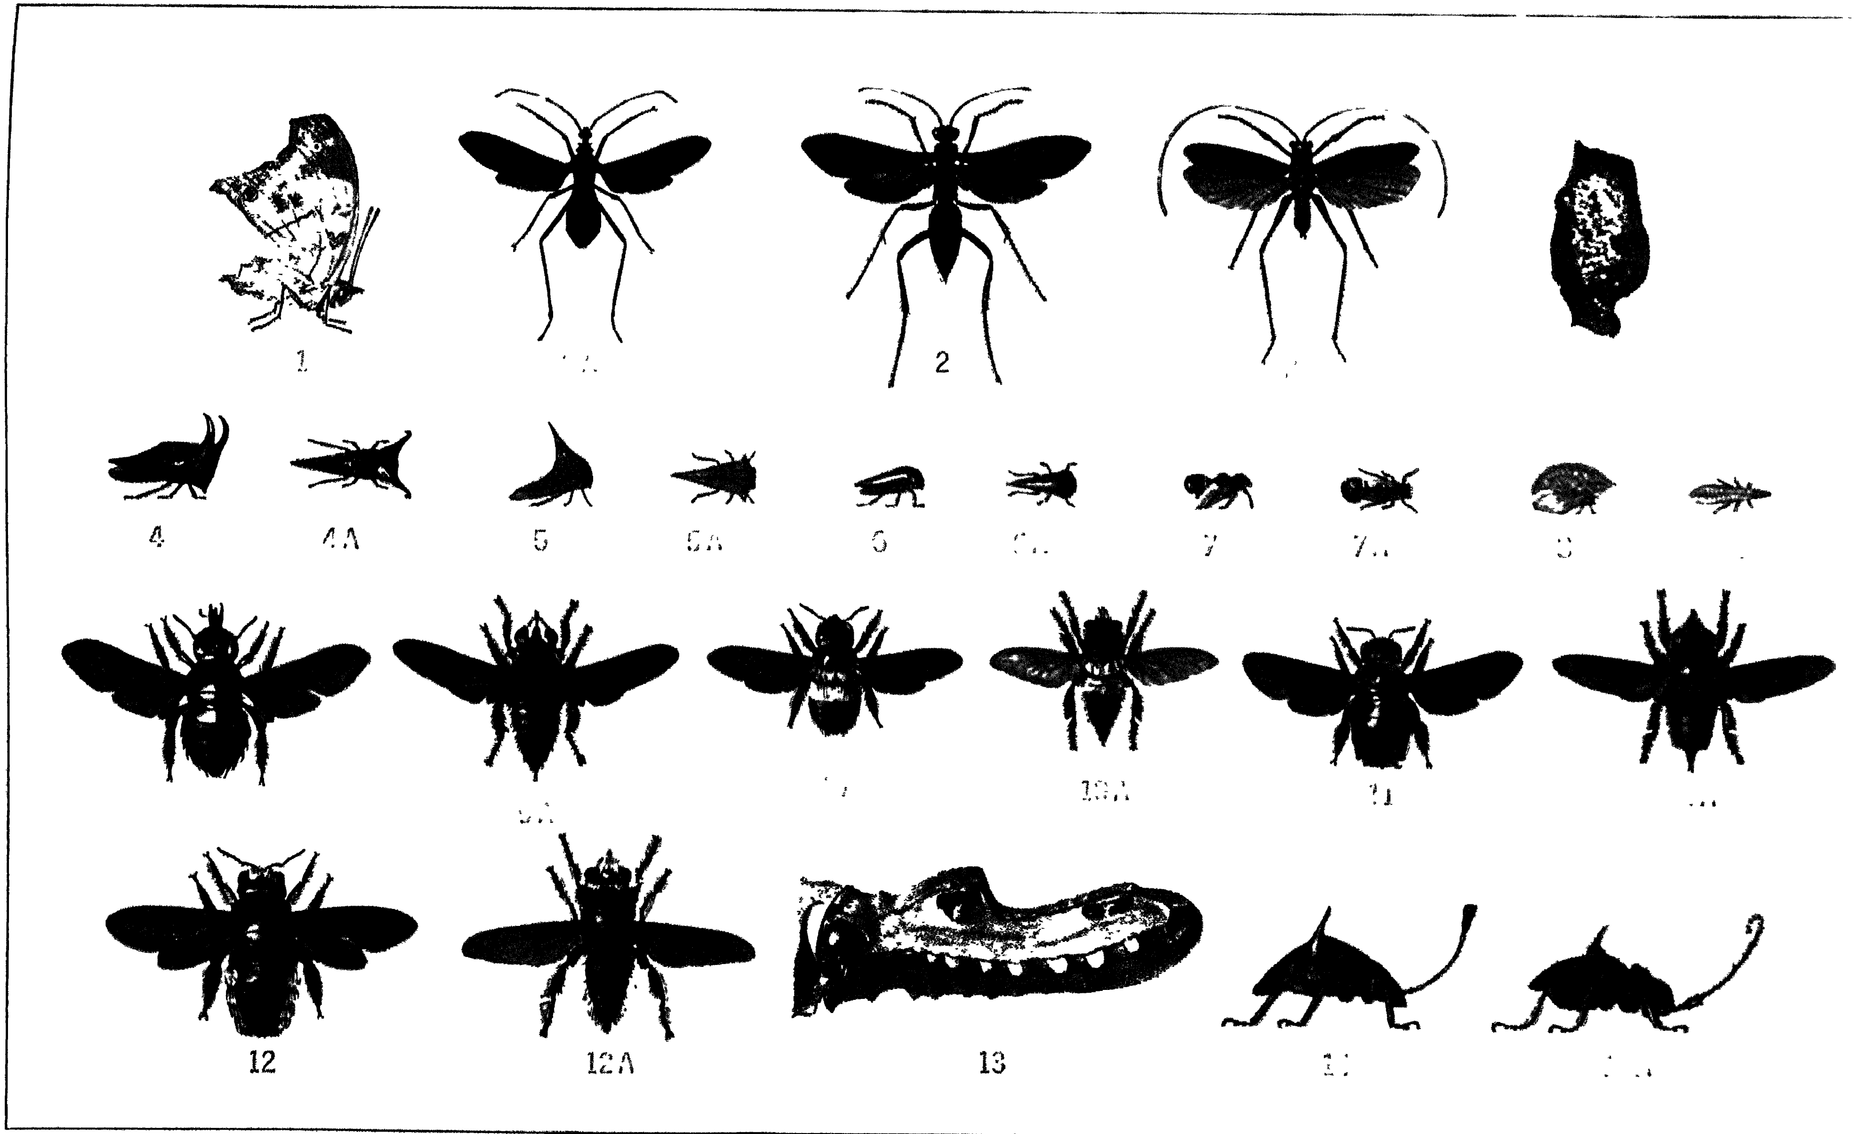
It is obvious that this resemblance between the butterflies of distasteful groups is, as Bates recognized, a different thing from the mimicry he sought to explain by his hypothesis—the likeness of a harmless or palatable species to a formidable or nauseous one which advertises its qualities by warning characters, especially colours, but often by movement, attitude or sound. The mimic gains advantage by the display of false warning characters. This is called "Batesian Mimicry" after its discoverer. The resemblance between the distasteful species themselves was later explained by Fritz Müller as an adaptation which economizes life by facilitating the education of enemies. If two distasteful species are alike they will share between them the lives which must be sacrificed before the enemies have learned to associate the warning characters with their special means of defence. If they are unlike, the lives must be contributed by each of them independently. These resemblances, which are a form of common or combined warning, are called "Müllerian mimicry." A Batesian mimic may be compared to an unscrupulous tradesman who copies the advertisement of a successful firm; Müllerian mimicry to a combination between firms to adopt a common advertisement and share the expense.

The qualities of Müllerian mimics differ widely in effectiveness and the species differ immensely in their relative numbers and in their capacities for variation. Hence models and mimics exist among them no less than in Batesian mimicry and in both there is the same evidence of the development of a mimetic from a different non-mimetic appearance still retained by allied species and often by the non-mimetic male. Those in second row are sufficient to show the likeness to the model which may be attained by a Müllerian mimic. But while Batesian mimicry is never an advantage and may be a disadvantage to its model, Müllerian mimicry is never a disadvantage but generally (theoretically always) an advantage. Although this criterion is in itself simple, it is extremely difficult, with our present imperfect knowledge of mimics and their enemies in life, to apply. The decision therefore rests on indirect evidence, which makes a different appeal to different minds, so that opinions differ widely as to the relative importance of the two kinds of mimicry.

It will be generally agreed that the resemblance of a Batesian mimic to its model is closely related to protective resemblance. In fact Bates originally included both resemblances under mimicry. A. R. Wallace and nearly all later writers on the subject have differed from him in this because, although the two classes are so near akin, the species in one are conspicuous, in the other well-concealed. They may, however, be conveniently grouped together under deceptive (or apatetic) resemblance. Both classes include palatable species, much sought after by the enemies of the group to which they belong. Any evidence supporting the conclusion that a mimic has been developed from a species with concealing colours would be evidence that it is a Batesian and not a Müllerian mimic. Such evidence may generally be obtained by comparison with its closest non-mimetic allies, and in butterflies often by comparing a mimetic female with its non-mimetic male, paying special attention to the under-surface, upon which concealing colours are specially developed. In the tropical American butterfly *Protogonius,* conspicuously mimetic on the upper surface and dead-leaf-like on the under, Kaye has recently observed that the latter appearance is so transparent that when the insect is sailing with expanded wings above the observer, he can only see the colours of the upper side.

If, on the other hand, the above comparisons lead to the conclusion that a mimic belongs to a group with warning colours, especially one which supplies models for mimicry,—we should, in the opinion of the present writer, be justified in considering it as Müllerian. Special evidence is offered by some mimics which retain warning characters independent of the mimetic appearance, and by others which, themselves resembling a central model, nevertheless act as models for still more outlying members of an association. Still stronger evidence may sometimes be found in reciprocal relationship between the species of two groups or between the groups themselves, *A* usually supplying models and *B* their mimics, but *B* also including models mimicked by species in *A*. In any case it is often difficult to draw the line between Batesian and Müllerian mimicry.

It is not always necessary, as has been generally assumed, that a mimetic pattern should be beneficial to the species. Certain butterflies which have developed such patterns in the presence of Danaine or Acraeine models are equally abundant, but non-mimetic, in other areas where the models are absent. It is clear that, in these species, the variations which promote the resemblance have been selected, but it is equally clear that the average number of survivors in each generation was not thereby increased. It is the proportion of survivors with and without the mimetic pattern that has been changed, not the total number of surviving



DRAWN FOR THE ENCYCLOPÆDIA BRITANNICA BY MISS O. F. TASSART FROM SPECIMENS IN THE HOPE DEPARTMENT, OXFORD UNIVERSITY MUSEUM, AND THE BRITISH MUSEUM (NATURAL HISTORY)

MIMETIC RESEMBLANCES AMONG INSECTS

1. A butterfly with a damaged wing which is evidence of bird attack; this common injury was seen to be caused by a bird
2. Brazilian fossorial wasp with (2a) its mimic bug and (2b) its long-horned grasshopper mimic
3. Cocoon of African moth covered with sham parasitic cocoons which were produced by a caterpillar

4 to 8. Tropical American membracid bugs shown from above and side, emphasizing the resemblance of the covering shield of the insect's body to (4) a hooked seed, (5) a thorn, (6) a smooth seed, (7) an ant, (8) a cocoon of a nauseous moth

9. Indian carpenter bee and (9a) its fly mimic
10. African carpenter bee and (10a) its fly mimic
11. Second African carpenter bee and (11a) its fly mimic
12. Third African carpenter bee and (12a) its fly mimic
13. Front of head of South American fulgorid, resembling the head of an alligator
14. Bornean nauseous beetle and (14a) its longhorn mimic, with a pencil of hairs imitating the spine of the model

individuals of the species. For this process, J. S. Huxley has suggested the term intra-specific selection.

One of the chief objections urged against the interpretation of mimicry as a resemblance perfected by selection is the belief that birds rarely attack butterflies. Some naturalists of great experience state that they have never witnessed such an attack. Nevertheless those who have paid special attention to this aspect of the subject have recorded numbers of instances from their own observation. Fig. 1 on Plate II. represents an injury seen by F. Muir to be inflicted by a bird upon a butterfly at Durban. The insect was at rest and the bird, attacking it from the rear, has shorn through both hind-wings symmetrically. Now this is a common type of injury and it is reasonable to suppose that it is generally if not always caused in the manner observed by Muir and others. Again Swynnerton in Rhodesia and Lamborn in Nyasaland have found the impress of a beak upon the wings which they have picked up after seeing them torn off by a bird. And such beak-marks are often found on specimens by those who look for them.

The remaining figures on Plate II. illustrate mimicry in other insects, especially the species resembling the most formidable of all models, the bees and wasps, among which, it must be added, Müllerian combinations are especially prevalent. Striking examples of the carpenter bees (Xylocopidae) and their fly mimics are represented in figures 9–12A, fig. 9 being a black Indian species (*Xylocopa tenuiscapa*) mimicked by the fly (*Hyperechia xylocopiformis*) shown in fig. 9A. The following three examples are African, fig. 10 the white-banded bee *X. inconstans* and 10A its fly mimic *H. bifasciata*; fig. 11, the reddish-brown banded *X. flavorufa*, with 11A *H. marshalli*, the model and mimic here represented having been taken within a few yards of each other at Mt. Mlanje, Nyasaland; fig. 12, the white-marked *X. nigrita*, with 12A, *H. consimilis*. It has been proved in recent years that the larvae of these flies burrow into the tunnels made by the larvae of their models and devour the occupants. It might appear at first sight that the object of the mimetic resemblance is to enable the flies to approach the nest and lay their eggs near or within the opening, but no such aid is necessary, for the mimics are more powerful fliers and more alert than their models. They are also more formidable and sometimes have been known to prey upon the bees themselves although generally upon other insects; but with all their other powers they have not the dreaded sting and are therefore protected by resembling the much commoner bees among which they live.

Wasps and bees are also mimicked by many other insects of varied groups. Fig. 2 represents a Brazilian sand-wasp (*Pepsis*) the model of 2A, a bug (*Spiniger*), and 2B a long-horned grasshopper (*Scaphura*). The movements in life of these two mimics—both members of unwasp-like groups—are known to promote the resemblance. The wasp's yellow-tipped antennae are seen to be short and thick as compared with those of its mimics but in both the section near the base is thickened and that beyond of hair-like fineness so as to be invisible except on close inspection. The end of the thick section is yellow in the grasshopper like the tip of the wasp's antennae. Similarly in certain beetles which mimic others with shorter knobbed antennae, a thickening at the corresponding distance from the base, or in some species the appearance of a thickening produced by a tuft of hairs, brings about a superficial likeness to the model. The close resemblance to a powerful curved spine on the wing-cases of the model, a distasteful Bornean beetle (an Endomychid), fig. 14, is similarly brought about by a curved pencil of hairs on its Longicorn mimic (*Zelota*) shown in 14A. Examples such as these afford strong evidence that the likeness has been achieved by the selection of any variation which led in the right direction, and as a result some feature in the mimic which seems to the eye to be similar to that of the model is often in its essential structure entirely different.

A good example of a mimetic resemblance attained in many ways is to be seen in the large tropical American association of diverse butterflies and day-flying moths which have developed transparent areas on their wings in mimicry of dominant Ithomiine models. Transparency has been attained by the following different methods in different mimetic species or groups of species:—(1) the scales of the wing may be so reduced in size that the light passes between them; (2) remaining the same size they may become much fewer; (3) they may stand up on edge; (4) remaining in the usual overlapping position they may become themselves transparent. Furthermore in the models themselves, the scales of the transparent parts have become minute vestiges, reduced to a much greater extent in one of the two genera to which the species belong. It may be added that the wings of many moths which mimic bees are, on emergence from the chrysalis, covered with loosely attached scales which blow off during the first flight. Such different methods of attaining the same end are to be expected if the development has been brought about by natural selection, for it is unreasonable to believe that similar variations would appear in very different species with very different natures.

The most convincing evidence of the development of mimicry and protective resemblance by natural selection is to be found in the Homoptera which, in addition to the cicadas, aphides, etc. also include the Membracidae, a family of small insects found nearly all over the world but most commonly in tropical America. These insects have, on the body-ring behind the head, a projection which grows backwards and expands into a shield covering every part except the head, wings and legs. The form of the concealed body is much like that of the allied greenfly and other aphids of our gardens. Five tropical American membracids are represented in figs. 4–8A. *Hemikyptha*, like a hooked seed, seen from above in 4A, from the side in fig. 4; the thornlike *Umbonia* in figs. 5, 5A; the smooth-seedlike *Hebetica* in 6, 6A; the ant-like *Heteronotus* in 7, 7A; finally *Oeda*, resembling the orange-coloured, freely exposed cocoon of a distasteful moth, in 8, 8A. Thus in the Membracidae the concealing or the mimetic appearance is developed on the covering shield, and not, as in so many other insects, on the body. Mimicry is only developed where it can be seen. The value of the ant-mimicry in figs. 7, 7A has been questioned because the Membracidae, like the allied froghoppers (Cercopidae), can escape by jumping, but this is only one of the numerous examples in which different methods are adopted by a species so that if the first fails there is still a chance of success by the second. It has also been objected that ants have many enemies and are therefore dangerous models. Haase is the only naturalist who has thought it necessary to assume that the special protection of models confers absolute immunity, even believing that it is efficient against the insect-enemies of insects. We know, however, that the species which are most distasteful to the higher insect-eating animals are especially liable to be attacked by parasitic and predaceous insects. Admitting the existence of numerous enemies, ants nevertheless possess qualities which render them the most successful insects in the world. Analogous reasoning would attempt to show that the form, colour and pattern of grass-feeding caterpillars are valueless because so many animals feed upon grass!

The mimicry of ants is a vast subject which cannot be treated even superficially here. They are models not only for insects of many diverse kinds but also, in movement as well as appearance, by numerous spiders. Certain species of the carnivorous mantises and also of long-horned grasshoppers mimic ants when small but in their later stages become flower- or leaf-like. Some idea of the advantage which may be conferred by resembling these models is suggested by a study of their guests. Since 1891 H. Donisthorpe has discovered in British ants' nests 150 species of insects, spiders and mites new to the country, including 70 new to science. Of these guests 28 species are mimics of ants and thus would be protected outside the nest or in a disturbed nest against enemies which fear the ants. In addition to these British ants are mimicked by 34 species living independently, and by 15 species possibly guests, possibly independent.

BOGEYS

A very different kind of mimicry is adopted by another tropical American homopterous insect, one of the large lantern flies (Fulgoridae). The front part of the head of this insect, *Laternaria lucifera*, projects forward as a hollow mask which resembles in remarkable detail the head of an alligator as may be seen from the side view represented in fig. 13. The true eye of the insect is

have served with Marmont in the Salamanca campaign. In the campaign of 1813 and 1814 he served under Wellington. After the restoration of Ferdinand he was exiled. His political opinions were democratic and radical, and as a yeoman he disliked the hidalgos (nobles). The revolution of 1820 brought him back, and he served the Liberal party in Galicia, Leon and Catalonia. On Nov. 1, 1823, he was compelled to capitulate to the French supporters of Ferdinand VII., but escaped to England by sea. In 1830 he took part in an unsuccessful rising against Ferdinand. On the death of the king he was recalled to Spain, and the government of the regent Christina gave him the command against the Carlists in 1835, though they feared his Radicalism. By this time, years, exposure and wounds had undermined his health. He was also opposed to Thomas Zumalacarregui (*q.v.*), an old officer of his in the War of Independence, and an even greater master of irregular mountain warfare. His health compelled him to resign in April 1835, and his later command in Catalonia was only memorable for the part he took in forcing the regent to grant a constitution in August 1836. He died at Barcelona on Dec. 24, 1836.

AUTHORITIES.—In 1825 Mina published *A Short Extract from the Life of General Mina,* in Spanish and English, in London. Mention is made of him in all histories of the affairs of Spain during the first third of the 19th century. His full Memoirs were published by his widow at Madrid in 1851–52.

MINANGKUBAU, the name for a mountainous district of central Sumatra and for the true Malay tribe inhabiting it, the *Orang Malayu,* from which sprang the civilized Malay race, whose migrations, starting in the 12th century, made them the dominant race in the Malay archipelago. The tribe is now Muslim, but the system of confederate villages governed by the assembled chiefs of the different clans in council still exists and the matrilineal system is observed in reckoning descent and relationship. Members of the royal clan seem to have had powers over property not unlike those of Polynesian chiefs (*see* MALAY).

See Marsden, *History of Sumatra* (1783); Winstedt, *Malaya* (1923).

MINARET, the tower usually attached to a Mohammedan mosque, from which the muezzin gives the call to prayer at the appointed hour. The origin of the form has been traced to the pharos or lighthouse at Alexandria. The Arabic word *manar* or minar signifies lighthouse. Early examples are those built by El Walid for the mosque at Damascus (707), and that of the mosque at Ibn Tulun at Cairo (879); the latter is remarkable for its heavy, square base and the external stair which leads up to the gallery from which the call to prayer is sung.

Four characteristic types of minarets were later developed. The first is the type of Cairo and Syria in which there are usually several galleries supported on stalactite work with the tower receding in stages at each gallery and the whole crowned with a bulbous dome. At times the lowest stage is square. Characteristic examples are those of the mosque of El Moyed, Cairo (1416); of Sultan Barkuk, Cairo (1405) and of Kait Bey, Outside the Walls, Cairo (1468); and the two later minarets of the mosque at Damascus (*c.* 1400). The second type, that of Morocco and Spain, consists simply of a large, richly decorated, square tower with a smaller square pavilion at the top, the platform over the lowest stage serving as the gallery for the call to prayer. This type is frequently built of brick, with rich relief patterns on all four sides. Noteworthy among them are the simple, low minaret at Kairouan (probably 9th century); that of the Koutoubia at Marrakech (1184); of Hassanat Rabat in Morocco (1184) and the famous Giralda at Seville (1195). The third type, characteristic of Persia, usually consists of a long, slender, tapered, cylindrical turret, most frequently placed in pairs flanking a great entrance arch, and usually carrying a single, high gallery and capped by a low dome. The whole is often cased in glazed Persian tile and glows with green, blue and yellow. Examples of the Persian type are the minaret of the tomb of Tamerlane at Samarkand (1405), those of the Shir-dar mosque at Samarkand (1601), and those of the imperial mosque at Ispahan (1613–27), the last noteworthy because of the delicate wooden gallery with open-work railing and slim posts that crowns the balcony from which the call to prayer is given. The fourth class comprises the slim, tapered, circular or polygonal minarets of Turkey which are probably based on Persian precedent, although frequently built of white marble and always without colour decoration. In most cases, however, instead of the single gallery of the Persian minaret, there are two, or even three, and the minarets are universally capped with slim, wooden cones. There are usually two minarets on the smaller mosques, and from two to six on the larger ones. The six minarets of the mosque of Sultan Achmed I. (1615), at Constantinople, are characteristic.

In India, early minarets were much affected by the native Hindu styles. Thus the famous Koutub Minar at Delhi (early 13th century), in its ridged masonry and rich solidity owes much to the Jaina style. Later examples show, on the other hand, strong Persian influence. The forms are, nevertheless, treated with that peculiar delicacy and restrained richness typical of Mogul work.

See H. Saladin, *Manuel d'Art Musulman,* vol. i. Architecture (1907). (T. F. H.)

MINAS (MINOÏDES) (*c.* 1790–1860), Greek scholar, was a native of Macedonia. During the Greek War of Independence he migrated to Paris, where he tried to enlist the sympathies of Europe on behalf of his countrymen and to promote the study of ancient and modern Greek. He discovered two important mss. in the monastery of Mt. Athos, part of a treatise now believed to be by Hippolytus (*q.v.*) and the greater portion of the Fables of Babrius.

MINAS GERAES (*i.e.,* "general mines"), popularly MINAS, an inland State of Brazil, covers an area of 221,861 sq. m. upon the great Brazilian plateau. Among the Brazilian States it is fifth in size and first in population—5,888,174 in 1920.

The surface of Minas Geraes is broken by mountain ranges and deeply eroded river-courses, the latter forming fertile valleys shut in by partly barren uplands, or campos. The principal mountain ranges are the Serra da Mantiqueira on its southern frontier and its north extension, the Serra do Espinhaço, which runs parallel to the Serra do Mar, or coast-range, and separates the inland or campo region from a lower forested zone between the two ranges. Most of the wooded district south of the Mantiqueira belongs to the States of São Paulo and Rio de Janeiro, but east of the Espinhaço it belongs to Minas Geraes and extends eastward to the Serra das Aymores, on the frontier of Espirito Santo. This zone has an abundant rainfall, dense forests and a fertile soil. It is drained by the Doce, Mucury, Jequitinhonha and Pardo. The southern part of this region is well populated, and is covered with coffee and sugar plantations. On the western frontier a northern extension of the great central chain of Goyaz forms the water-parting between the drainage basins of the São Francisco and Tocantins, and is known at different points as the Serra do Paranan, Serra de São Domingos and Serra das Divisões. South-east of this chain, between the headwaters of the Paraná and São Francisco, are the Serra da Canastra and Serra da Matta da Corde, an irregular chain of moderate elevation running north and south. The highest elevations in the State, so far as known, are Itatiaya (8,898 ft.) in the Serra da Mantiqueira, and Caraça (6,414 ft.), near Ouro Preto, in the Serra do Espinhaço.

Less than 100 m. from the city of Rio de Janeiro and 60 m. from the coast is the source of the Rio Grande, the larger of the two rivers that form the Paraná. North and parallel with its course is a low watershed, which separates its drainage basin both from that of the São Francisco and from that of the Parnahyba, the northern confluent of the Paraná. The latter rises on the western slopes of the Serra da Matta da Corde. The central and greater part of the State, is included in the drainage basin of the upper São Francisco. The climate of Minas Geraes is characterized by high sun temperatures and cool nights, the latter often dropping below the freezing point on the higher campos. The mean annual temperature is about 85° in the São Francisco valley, 77° on the campos of the south-east and 70° on the campos of the west. The year is divided into two seasons—wet and dry—the former lasting from November to May. This division is not so clearly marked in the south, especially in the "matta" (forest) regions,

prehistoric remains have been discovered on the common; while Woeful Dane Bottom, a neighbouring valley, was the scene of a Danish defeat (*c.* 918).

MIND: *see* PSYCHOLOGY.

MINDEN, a town of Germany, in the Prussian province of Westphalia, 44 m. by rail to the W.S.W. of Hanover, on the left bank of the Weser. Pop. (1925) 27,033. Minden (Mindun, Mindo), apparently a trading place of some importance in the time of Charlemagne, was made the seat of a bishop by that monarch, and subsequently joined the Hanseatic League. In the 13th century it was surrounded with walls. In 1648 the bishopric was converted into a secular principality under the elector of Brandenburg. From 1807 to 1814 Minden was included in the kingdom of Westphalia, and in the latter year it passed to Prussia. The fortifications were finally demolished in 1873. About 3 m. to the south of Minden is the so-called "Porta Westfalica," a narrow defile by which the Weser quits the mountains. The bishopric of Minden embraced an area of about 400 sq.m. and had about 70,000 inhabitants. The older parts of the town retain their narrow and crooked streets. The cathedral tower dating from the 11th century, illustrates the first step in the growth of the Gothic spire in Germany. The nave was erected at the end of the 13th century, and the choir in 1377–79. Among the chief edifices are the old church of St. Martin and the town hall, with a Gothic façade. Its industries include brewing, ship-building and the manufacture of tobacco, glass, soap, chocolate, leather, shoddy, cement and chemicals. There is also some activity in the building of small craft.

The Battle of Minden was fought Aug. 1, 1759, between the Anglo-Allied army commanded by duke Ferdinand of Brunswick and the French under Marshal Contades, the latter being defeated. The most brilliant episode of the battle was the entire defeat of the French cavalry by the British infantry, but Minden, though it is one of the brightest days in the history of the British army, has its dark side also, for the British cavalry commander Lord George Sackville (*see* SACKVILLE, VISCOUNT) refused to obey the order to advance, several times sent by Ferdinand, and thereby robbed the victory of decisive results. For an account of the battle, *see* SEVEN YEARS' WAR.

MINDEN, a city of north-western Louisiana, U.S.A., the capital of Webster parish; on Federal highway 80 and served by the Louisiana and Arkansas railway. Pop. (1920) 6,105 (41% negroes); and in 1930, 5,623 by Federal census. It has a large shipping trade in cotton and lumber, railway shops, and other manufacturing industries. Minden was founded in 1832 by Samuel Veeder and named after his home town in Germany.

MIND-READING: *see* TELEPATHY.

MIND STUFF THEORY, a term introduced by W. K. Clifford to denote the view that mind is composed of the same kind of ultimate elements as what appears to it as matter, and that these ultimate elements are of the nature of monads or spiritual entities. *See* W. K. Clifford, *Lectures and Essays* (1901); W. James, *Principles of Psychology* (1909).

MINEHEAD, a market town and seaside resort of Somersetshire, England, 188 m. W. by S. of London by the G.W. railway. Pop. of urban district (1931) 6,315. Minehead owed its origin and growth to its good harbour. Certain documents suggest that it had a corporate existence during the 15th century, but no record of the grant of a charter has been found. A charter of incorporation given by Elizabeth in 1558 vested the government in a portreeve, a steward and twelve burgesses, the continuance of the corporation being subject to the port and harbour being kept in repair. The charter lapsed in the reign of James I., and an attempt to obtain its renewal in the 18th century failed. The corporation was replaced by two constables chosen annually in the court leet of the manor until 1894, when an urban district council was appointed. The borough returned two members to parliament from 1558 until disfranchised by the Reform Act of 1832. A weekly market on Tuesdays and a fair (Sept. 29 to Oct. 2) were held from the 15th century. In 1465 a second annual fair on May 1 was granted by Edward IV., which is still held on the Wednesday in Whitsun week. The other fair has been discontinued, and the market day has been changed to Wednesday. During the 16th, 17th and 18th centuries Minehead had a considerable coastwise trade in wool, grain and wine, but began to decline owing to the migration of the woollen industry to the north of England, and to the decay of the herring fishery. A renewal of prosperity began when it acquired a reputation as a watering-place. The town has three parts: the Upper, built on a foreland known as North Hill; the Lower; and the Quay Town, with many old houses, stretching for about a mile beside the harbour. St. Michael's, the parish church, has a Perpendicular tower.

MINEO, town, province of Catania, Sicily, 34 m. S.W. of Catania by rail. Pop. (1921) 11,975. It occupies the site of the ancient *Menae,* founded by Ducetius in 459 B.C. Remains of ancient fortifications still exist. Four miles to the north is the Lacus Palicorum, a small lake in a crater, which still sends up carbonic acid gas. By it was the temple of the Palici, twin Sicel gods, the most holy place in Sicily, where an oath taken was especially binding, and an inviolable asylum for fugitive slaves.

MINER: *see* COAL AND COAL MINING, HEWER.

MINERAL DEPOSITS: *see* ORE DEPOSITS.

MINERALOGY, the science which describes and classifies the different kinds of mineral matter constituting the material of the earth's crust and of those extra-terrestrial bodies called meteorites. The study of minerals is thus a branch of natural history, but one in which certain of the exact sciences find an application. The determination of the composition and constitution of minerals is a chemical problem; their optical and other physical properties are determined according to the principles of physics; the study of their crystalline form and structure belongs to crystallography; their modes of occurrence, origins, associations and changes come within the province of geology and petrology; while a consideration of the localities at which they are found requires some acquaintance with geography. Finally, there is the economic side, dealing with the mining and application of useful minerals, the extraction of metals from their ores, and the uses of minerals for building, decoration and jewellery.

Many minerals have attracted the attention of mankind from the earliest times. The stone and bronze implements of prehistoric man and many of his personal ornaments and charms were directly or indirectly of mineral origin. The oldest existing treatise on minerals is by Theophrastus περί τῶν λίθων—*On Stones, c.* 315 B.C (Eng. version by John Hill, 1746), of which only a portion remains. Minerals were then classed as metals, stones and earths. The last five books of Pliny's *Historia naturalis,* written about A.D. 77, treat of metals, ores, stones and gems. Some of the Arabian philosophers devoted themselves to the study of minerals, and about 1262 Albertus Magnus wrote his *De mineralibus.* In the 16th century Georgius Agricola published several large volumes, dealing more especially with the mining and metallurgy of metalliferous minerals, in which more exact descriptions were given of the external characters; he mentioned several minerals by names (*e.g.* blende, fluor, quartz) which are now in common use. About the same period there appeared the systematic treatise on minerals of K. Gesner (1565), and that on precious stones by Anselm Boethius de Boodt (1609). The remarkable researches of Erasmus Bartholinus on Iceland-spar were published in 1669, and J. F. Henckel's *Pyritologia* in 1725. Later came the *Systema naturae* of C. Linnaeus (1735). Although the importance of chemical properties was recognized by the Swedish chemists—J. G. Wallerius (1747) and A. F. Cronstedt (1758)—the external characters of minerals formed the basis of the mixed systems of classification of A. G. Werner (1774) and of other authors, and even as late as the *Natural History System of Mineralogy* of F. Mohs (1820).

It was not until the end of the 18th and beginning of the 19th century, when the foundations of crystallography were laid by Romé de l'Isle and R. J. Haüy, and chemistry had assumed its modern phase, that any real advance was made in scientific mineralogy. It was then recognized that chemical composition and crystalline form were characters of the first importance, and that external (natural history) characters were often more or

less accidental. During this period numerous mineral substances were analysed by Scheele, Berzelius and others, and many new mineral-species and chemical elements discovered. After W. H. Wollaston's invention of the reflecting goniometer in 1809, exact measurements of the crystalline forms of many minerals were made. The principles of isomorphism and dimorphism enunciated by E. Mitscherlich in 1819 and 1821 respectively cleared up many difficulties encountered in the definition of mineral-species. About the same time also the discovery by E. L. Malus of the polarization of light gave an impetus to the optical examination, by Sir David Brewster and others, of natural crystals. Later, the investigation of rocks in thin section under the microscope led to the exact determination, particularly by A. Des Cloizeaux (1867), of the optical constants of rock-forming minerals.

For a detailed account of the history of mineralogy (including crystallography), *see* F. von Kobell, *Geschichte der Mineralogie von 1650–1860* (München, 1864); P. Groth, *Entwicklungsgeschichte der mineralogischen Wissenschaften* (Berlin, 1926).

I.—CHARACTERS OF MINERALS

Essential mineral characters are those relating to chemical composition, crystalline form, crystallo-physical properties and specific gravity; these are identical, or vary only within certain defined limits, in all specimens of the same mineral-species. Non-essential characters—such as colour, lustre, hardness, form and structure of aggregates—depend largely on the presence of impurities, or on the state of aggregation of imperfectly formed crystalline individuals. In an absolutely pure and perfectly developed crystal all the characters may be said to be essential, but such crystals are of exceptional occurrence in nature. (See, *e.g.*, Quartz and Calcite.)

In the following enumeration of the more salient characters of minerals it is to be noted that many of the terms used for non-essential characters are purely descriptive and have no exact definition; on the other hand, essential characters can be expressed numerically and are therefore perfectly definite.

1. MORPHOLOGICAL CHARACTERS

a. **Crystalline Form.**—This most important character of minerals can, of course, be determined only when the material available is in the form of crystals (*i.e.*, crystallized), which is not always the case. Massive aggregates of crystalline material are of much more frequent occurrence; when small fragments or thin sections of such material are transparent the crystalline symmetry may be determined, within certain limits, by the help of the optical characters (*see* below). External crystalline form must not, however, be considered alone apart from all other characters, for crystals of substances quite different chemically, *e.g.* silver iodide, zinc oxide and zinc sulphide, are sometimes almost identical in crystalline form.

All the six systems of crystals and most of the thirty-two symmetry-classes are represented amongst minerals (*see* Crystallography). Crystals of the same mineral-species may differ very widely in general form or habit; *e.g.*, crystals of calcite (*q.v.*) may be rhombohedral, prismatic, scalenohedral or tabular in habit. Besides habit there are frequently also characteristic kinds of groupings of crystals: thus parallel, divergent or radiating (*e.g.* scolecite), rosette-shaped (*e.g.* haematite—*Eisenrosen*), reticulated (*e.g.* rutile), or matted. The faces of natural crystals may be smooth, rough, striated, curved or drusy, *i.e.*, studded with small crystal faces and angles.

b. **State of Aggregation: Structure.**—According to the particular state of aggregation of a number of imperfectly developed crystals, which have grown together, various kinds of structure may be presented even by the same mineral species. The descriptive terms applied to these structures are almost self-explanatory: thus the structure may be granular (*e.g.* marble), fibrous (asbestos), radio-fibrous or stellated (wavellite), columnar (beryl), laminar or lamellar (talc), bladed (kyanite), etc., according to the relative shape and sizes of the individual crystals composing the aggregate. When the constituent crystals are invisible to the unaided eye the material is described as compact; incoherent aggregates are powdery or earthy. Minerals which are really amorphous, *i.e.* without any crystalline structure, are comparatively few in number (*e.g.* opal); many which are apparently amorphous are really microcrystalline (*e.g.* turquoise). The term massive is often used loosely for a crystalline mineral not showing crystal-faces. Crystal-aggregates often assume more or less accidental and imitative external forms to which the following descriptive terms are applied: dendritic or arborescent (*e.g.* copper, pyrolusite), mossy (copper), leafy (gold), wiry or filiform (silver), capillary (millerite), coralloidal (aragonite), globular (aragonite, with concentric structure; wavellite, with radiated structure), mammillary or with breast-like protuberances (arsenic), nodular (malachite), warty (menilite), botryoidal (dolomite), reniform (menilite), amygdaloidal (agate), stalactitic (calcite, chalcedony).

2. PHYSICAL CHARACTERS

a. **Optical Characters.**—The action of crystallized matter on transmitted light is a character of the highest importance in mineralogy. Even when the substance is opaque in large masses, it may be sufficiently transparent when in small splinters or in thin sections for the determination of the optical characters. The refractive indices, strength of the double refraction, optic axial angle, extinction angles on certain faces, are constant for each mineral-species (*see* Crystallography).

In their diaphaneity, or degree of transparency, minerals differ very widely even in the same species. Some, such as metals and most metallic sulphides are always opaque; while others may vary in different specimens from perfect transparency to perfect opacity (in the latter case, however, minute fragments will, as a rule, still be transparent). A good example of this is afforded by the varieties of quartz; rock-crystal is water-clear, chalcedony is translucent, and jasper opaque.

The colour of minerals is the character which first arrests attention; but being a character which may vary almost indefinitely in one and the same kind of mineral, it affords a typical example of a non-essential character. Thus, fluor-spar and quartz, when in well-formed and chemically pure crystals, are quite colourless and transparent; but it would be easy to collect a series of each of these minerals in which almost every shade of colour is represented. The difference is due solely to the accidental presence of traces of colouring matters so small in amount that their exact nature is difficult or impossible to determine. The value of diamond, corundum and other gem-stones depends largely on these accidental differences in colour. Such substances, which are essentially colourless and owe their colour to the presence of colouring matter as an impurity, are said to be "allochromatic"; any colour they may possess is non-essential. In some other substances, known as "idiochromatic," the colour is a definite and essential character.

An important character of transparent crystals is that of unequal absorption in different directions; so that light will, as a rule, be differently coloured according to the direction in which it has travelled through the crystal; this is known as dichroism or pleochroism (*see* Crystallography). Certain minerals (*e.g.* zircon and those containing cerium) when examined with a spectroscope by transmitted light show characteristic absorption spectra.

The colours of minerals may also be due to the interference of rays of white light at the surfaces of thin crevices or minute inclusions, either tabular or fibrous in form, in the mineral; for example, the play of colours of opal; the change of colours of labradorite; the bands of rainbow colours (Newton's rings) seen along cleavage cracks and irregular internal fractures (*e.g.* in quartz); the iridescent tarnish due to a superficial film of a decomposition product (*e.g.* "peacock copper ore").

The true colour of a mineral is best revealed by its "streak," *i.e.* the colour of its powder. This is obtained by scratching the mineral, or by crushing a fragment of it on a sheet of white paper, or rubbing it upon unglazed porcelain. The streak of allochromatic minerals is white, while that of idiochromatic minerals is coloured and is often of determinative value. Ores of iron may, for example, generally be distinguished by their streaks.

Another character depending on light is that of lustre, which is

often very characteristic in certain minerals, though it may be considerably modified by the state of aggregation. For example, the usual adamantine lustre of diamond is not exhibited by the compact aggregate known as carbonado; while earthy masses of any mineral will be devoid of lustre. Descriptive terms applied to the kinds of lustre are: metallic (*e.g.* pyrite), adamantine (diamond), vitreous (quartz), resinous (pyromorphite), greasy (elaeolite), waxy (chalcedony), pearly (talc, heulandite and other minerals with a perfect cleavage), silky (satin-spar), etc. The degrees of intensity of lustre: splendent, shining, glistening, glimmering and dull, depend usually on the smoothness of the crystal-faces.

The phenomena of phosphorescence (*q.v.*), fluorescence (*q.v.*) and radioactivity (*q.v.*) are strikingly exhibited by some minerals (*see* FLUOR-SPAR, DIAMOND, ETC.).

On the optical determination of minerals *see* E. S. Larsen, "The Microscopical Determination of Nonopaque Minerals" (*Bull.* U.S. Geol. Survey, No. 679, Washington, 1921).

b. **Microscopical Examination of Opaque Minerals.**—A method for the investigation of opaque minerals borrowed from metallography (*q.v.*), in which polished sections are examined under the microscope in reflected light, is specially useful for the study of metallic ores and consequently finds an economic application in the valuation of ore deposits. By this means several mineral species of which the ore is composed can be distinguished and their relations to one another determined; *e.g.*, the order of their deposition, and whether they are of primary or secondary origin. The process of grinding and polishing the sections presents certain difficulties owing to the extreme differences of hardness of the several minerals that may be present. The prepared section is illuminated vertically by means of a right-angle prism placed in the tube of the microscope above the objective. Details of structure can be brought out by etching the section with various chemical reagents. The several characters (colour, hardness, relief) of the minerals, together with their behaviour towards reagents, help in their determination. But in many cases ordinary simple tests made on fragments detached from the polished surface are more reliable. Electrical tests can be made with quite simple apparatus; for example, the electrical conductivity can be determined with a dry cell and voltmeter using needles as terminals on the polished surface. Certain optical determinations can also be made in reflected polarized light.

One result of this study of opaque minerals is to draw attention to the extremely intimate association and intergrowth of many of the ore-minerals; this is shown in some photo-micrographs. What to all appearances by ordinary methods is a homogeneous mineral may be found by the new method to be really heterogeneous; and, in fact, several supposed mineral species have been proved to be mixtures, and well-developed crystals have in certain cases been found to contain enclosures of other minerals. The method is thus of use for ascertaining the degree of purity of material collected for exact chemical analysis when the formula of a species is to be established. The long-debated question as to how silver exists in argentiferous galena (lead-ore) has been studied by this method.

The technique of the subject (called mineralography, mineragraphy or chalcography) is dealt with in the text-books; J. Murdoch, *Microscopical Determination of Opaque Minerals* (N.Y., 1916); W. M. Davy and C. M. Farnham, *Microscopic Examination of the Ore Minerals* (N.Y., 1920); H. Schneiderhöhn, *Anleitung zur mikroskopischen Bestimmung und Untersuchung von Erzen . . .* (Berlin, 1922); R. W. van der Veen, *Mineragraphy and Ore-deposition* (The Hague, 1925).

c. **Magnetic, Electrical and Thermal Characters.**—These as far as related to crystalline form, are discussed under crystallography (*q.v.*). Magnetite ("lode-stone") is the only mineral which is strongly magnetic with polarity; a few others, such as pyrrhotite and native platinum, possess this character to a much less degree. Many minerals are, however, attracted by the pole of a strong electromagnet, while a few (diamagnetic) are repelled.

Most minerals with a metallic lustre are good conductors of heat and electricity; others are bad conductors. For example, graphite is a good conductor, while diamond is bad. Non-conductors of electricity become electrified by friction, some positively (*e.g.* quartz and topaz), others negatively (*e.g.* sulphur and amber). The length of time during which different gem-stones retain their charge of frictional electricity was made use of by R. J. Haüy as a determinative character. For the pyro-electrical and thermo-electrical characters of crystals *see* CRYSTALLOGRAPHY. Some minerals—for example, salt, sylvite and blende—are highly diathermanous, *i.e.* transparent for heat-rays.

The specific heat and melting point of minerals are essential characters capable of exact measurement and numerical expression, but they are not often made use of. The following scale of fusibility was proposed by F. von Kobell:—

1. Stibnite	(525°C.)	5. Orthoclase	(1175°C.)
2. Natrolite	(965°C.)	6. Bronzite	(1300°C.)
3. Almandine	(1265°C.)	7. Quartz	(1430°C.)
4. Actinolite	(1296°C.)		

The melting points given above in parentheses were determined by J. Joly. Stibnite readily fuses to a globule in a candle-flame, while quartz is infusible before the ordinary blowpipe.

d. **Characters Depending on Cohesion.**—Some minerals (*e.g.* a sheet of mica) are highly elastic, springing back to their original shape after being bent. Others (*e.g.* talc) may be readily bent, but do not return to their original form when released; these are said to be pliable or flexible. Sectile minerals (*e.g.* chlorargyrite) may be cut with a knife without being fractured; related characters are malleability (*e.g.* argentite) and ductility (*e.g.* silver). The tenacity, or degree of frangibility of different minerals varies widely: they may be brittle, tough, soft or friable. The fractured surface produced when a mineral is broken is called the "fracture," and the kind of fracture is often of determinative value; descriptive terms are: conchoidal (*e.g.* quartz, which may often be recognized by its glassy conchoidal fracture), sub-conchoidal, uneven, even, splintery (*e.g.* jade), hackly (*e.g.* copper).

In many cases when a crystallized mineral is broken it separates in certain definite directions along plane surfaces. This property of "cleavage" (*see* CRYSTALLOGRAPHY) is an important essential character of minerals, and one which is often of considerable assistance in their recognition. For example, calcite, with its three directions of perfect cleavage parallel to the faces of a rhombohedron, may always be readily distinguished from aragonite or quartz.

"Hardness," or the resistance which a substance offers to being scratched by a harder body, is an important character of minerals, and being a test readily applied it is frequently made use of. It must, however, be remembered that the hardness of an incoherent or earthy aggregate of small crystals will be very different from that of a single crystal. A comparative "scale of hardness" was devised by F. Mohs in 1820 for the purpose of giving a numerical statement of the hardness of minerals.

Mohs's Scale of Hardness

1. Talc.	6. Orthoclase.
2. Gypsum.	7. Quartz.
3. Calcite.	8. Topaz.
4. Fluor-spar.	9. Corundum.
5. Apatite.	10. Diamond.

These minerals, arbitrarily selected for standards, are successively harder from talc the softest, to diamond the hardest of all minerals: a piece of talc is readily scratched by gypsum, and so on throughout the scale. A mineral which is capable of scratching calcite and can itself be as easily scratched by fluor-spar is said to have a hardness of $3\frac{1}{2}$. Some care is required to avoid error in the determination of hardness: it is best to select a smooth crystal-face, cleavage-surface or fracture on which to rub a sharp corner of the scratching mineral; the powder should be wiped off and the surface examined with a lens to see if a scratch has really been produced or only powder rubbed off the corner of the mineral with which the scratching was attempted. With a little practice a fair idea of the hardness of a mineral may be obtained with the use of a knife or file, which will scratch all minerals with a hardness of 6 or less. Thus pyrite (H.=$6\frac{1}{2}$) and chalcopyrite (H.=$3\frac{1}{2}$), apatite (H.=5) and beryl (H.=$7\frac{1}{2}$), or gem-stones and their paste imitations may be readily distinguished by this test. Talc and gypsum can be readily scratched with the finger-nail.

Planes of parting, etching figures, pressure- and percussion-figures are sometimes characters of importance in describing and

distinguishing minerals. (*See* CRYSTALLOGRAPHY.)

e. **Specific Gravity.**—The density or specific gravity of minerals is an essential character of considerable determinative value. In minerals of constant composition it has a definite value, but in isomorphous groups it varies with the composition: it also, of course, varies with the purity of the material. It is a character which has the advantage of numerical expression.

The exact determination of the specific gravity of minerals is therefore a matter of some importance. Three methods are in common use, viz. hydrostatic weighing, the pyknometer, and the use of heavy liquids. The first two methods are only applicable when a weighable amount of pure material can be selected. This is generally laborious. For exact determinations the pyknometer method is usually to be recommended, using for material the pure fragments which have been selected for quantitative chemical analysis. With a single pure crystal of a faceted gem-stone the method of hydrostatic weighing is usually applicable, providing the stone is not too small. The most ready method, however, is that afforded by the use of a heavy liquid, and the most convenient liquid for this purpose is methylene iodide. This liquid has a specific gravity of 3·33. Benzene is added until the fragment just remains suspended, neither floating nor sinking; the specific gravity of the fragment will then be the same as that of the liquid, and the latter may be determined by hydrostatic weighing or, more conveniently, by means of indicators. Small recognizable crystals of the following minerals may be kept at hand as a set of indicators: gypsum (sp. gr. 2·32), colemanite (2·42), orthoclase (2·56), quartz (2·65), calcite (2·72), aragonite (2·93), rubellite (3·02), apatite (3·20), dioptase (3·32), etc. With a series of tubes containing mixtures of methylene iodide and benzene of different densities and suitable indicators, specific gravities may be rapidly and accurately determined. For minerals of specific gravity greater than 3·33 heavier liquids have been suggested; the best being thallium silver nitrate ($TlAg(NO_3)_2$), which melts at 75° C. to a clear liquid with a density of 4·8.

f. **Touch, Taste and Smell.**—In their action on the senses of touch, taste and smell a few minerals possess distinctive characters. Talc is unctuous or soapy to the touch; tripolite and trachyte are respectively meagre and harsh. Some porous minerals (*e.g.* clays and hydrophane) adhere to the tongue. Gem-stones may often be distinguished from their glass imitation by the fact that they feel colder, since they are better conductors of heat. Bitumen and clays, when moistened, have a characteristic smell; pyrite and some other sulphides when rubbed emit a sulphurous odour. Minerals which are soluble in water have taste.

g. **Radioactivity.**—The strong radioactivity (*q.v.*) of uranium minerals affords a ready means of recognizing these valuable ores; the mineral may be wrapped up with a photographic plate, which is afterwards developed, but a simpler and quicker test is that with a simple gold-leaf electroscope. A piece of the mineral to be tested is placed on the cap of the electroscope, which is then charged with electricity; if the mineral contains uranium (and hence radium), the gold leaves will soon come together.

Determinations of the ratio of the amount of uranium to the amounts of the various products of its decay (radium, helium, lead, etc.) present in various radioactive minerals give (knowing the rate of the decay) some idea of the period of time during which these products have been accumulating. In this way estimates have been made of the age in years of these minerals and even of the age of the earth; but, of course, many unknown factors must have been omitted from such calculations. Lead of radioactive origin, or isotopic lead—the final product of uranium decay—is found to vary slightly in its atomic weight (*q.v.*) according to the uranium mineral from which it is extracted.

To radioactivity are ascribed the well-known "pleochroic halos" —tiny spots or borders of deeper colour surrounding microscopic inclusions—long ago observed in certain rock-forming minerals (cordierite, andalusite, mica, etc.) when micro-sections of rock are examined in polarized light. The long and continued emission of X-rays from zircon or other mineral grains has caused a change in colour of the surrounding mineral for distances varying from 0·002 to 0·4 millimetre. A study of these has again given some information as to the age of the minerals. Much experimental work on the coloration of minerals has been done within recent years by exposing the minerals to the action of radiations of various kinds. For example, some diamonds acquire a green colour and fluor-spar becomes blue when placed in contact with radium bromide.

3. CHEMICAL CHARACTERS

Chemical composition is the most important character of minerals, and on it all modern systems of classification are based. A mineral-species cannot, however, be defined by chemical composition alone, since many instances are known in which the same chemical element or compound is dimorphous or polymorphous (*see* CRYSTALLOGRAPHY). In such cases a knowledge of some other essential character, preferably the crystalline form, is necessary, before the mineral can be determined.

All the known chemical elements have been found in minerals; and of many of them minerals are the only source. On the other hand, nitrogen, which is frequently present in organic substances, is rare in minerals; carbon has a wide distribution in mineral carbonates. It is estimated that the minerals of the earth's crust consist of about 47% by weight of oxygen, 27 of silicon and 8 of aluminium; silicates, and especially alumino-silicates, therefore predominate.

The chemical composition of minerals is determined by the ordinary methods of analytical chemistry. Since, however, minerals of different kinds usually occur intimately associated, it is often a matter of some difficulty to select a sufficiency of pure material for analysis. Thus the exact composition and the empirical formulae of several minerals, particularly amongst the silicates, still remain doubtful. Whenever possible, the chemical analysis should be made on small pure crystals which have been previously determined crystallographically. For the qualitative chemical examination of minerals, when only a small amount of material is available, the methods of blowpipe analysis and micro-chemical analysis are often convenient.

The principle of isomorphism (*see* CRYSTALLOGRAPHY) is of the highest importance in mineralogy, and on it the classification of minerals largely depends. In some minerals (*e.g.* quartz) isomorphous or vicarious replacement is not known to occur; but in the majority of minerals one or other of the predominating elements (generally the base, rarely that of the acid radical) may be isomorphously replaced by equivalent amounts of other chemically related elements. In some isomorphous groups of minerals replacement takes place to only a limited extent, and the element which is partly replaced always predominates; while in other groups the replacement may be indefinite in extent, and between the ends of the series the different members may vary indefinitely in composition, with no sharp demarcation between species. Thus in the group of rhombohedral carbonates the different species are usually sharply defined. In well-formed crystals of calcite the calcium is replaced by only small amounts of magnesium, iron, lead, etc.; in chalybite, however, iron is often more largely replaced by calcium, magnesium, manganese, etc., and the "brown spars" are not always readily distinguishable. In the dimorphous group of orthorhombic carbonates isomorphous replacement is less frequent, and the different species (aragonite, cerussite, etc.) are quite sharply defined. In other groups of minerals, particularly amongst the silicates, isomorphous replacement of the basic elements is so general that the several members of the series vary almost indefinitely in chemical composition, and will scarcely be the same for any two specimens, though it may be reduced to the same type of formula. For example, the formula of all varieties of garnet may be expressed generally as $R''_3R'''_2(SiO_4)_3$, where R''=Ca, Mg, Fe, Mn, and R'''=Al, Fe, Mn, Cr, Ti. Tourmaline affords another good example. In the plagioclase felspars (*see* PLAGIOCLASE) we have an example of the isomorphous mixing of two end-members, albite ($NaAlSi_3O_8$) and anorthite ($CaAl_2Si_2O_8$) in all proportions and with no sharp line between the several sub-species. In some other similar cases the end-members of the series are purely hypothetical: *e.g.*, in the scapolite group (mixtures of $Ca_4Al_6Si_6O_{25}$ and $Na_4Al_3Si_9O_{24}Cl$) and in the micas and chlorites. In such instances, where the formulae of the

CRYSTAL STRUCTURE

1. Calcite from Fontainebleau, France. This mineral consists of naturally occurring calcium carbonate crystallizing in the rhombohedral system. It is noted for the beauty and variety of its crystals. The crystals shown are remarkable in containing a large amount of enclosed sand
2. Cerussite from Broken Hill, New South Wales. A mineral consisting of lead carbonate and an important ore of lead. It crystallizes in the orthorhombic system and is frequently twinned
3. Stibnite from Japan. The mineral consists of antimony sulphide occurring as bladed or acicular orthorhombic crystals; an important ore of antimony

two end-members differ in type, "mass effect" may have some influence on the isomorphism.

In addition to isomorphous series, there are amongst minerals several instances of double salts, which contain the same constituents as the members of the isomorphous series: *e.g.*, dolomite (*q.v.*) and barytocalcite (*q.v.*).

The manner in which water enters into the composition of minerals is often difficult to determine. In some cases, *e.g.*, in the zeolites (*q.v.*), it is readily expelled at a low temperature, even at the ordinary temperature over sulphuric acid, and may be reabsorbed from a moist atmosphere or replaced by some other substances: it is then regarded as "water of crystallization." In other cases, when expelled only at a higher temperature, it is to be regarded as "water of constitution," forming either a basic salt (*e.g.* malachite, $Cu(OH)_2CO_3$) or an acid salt (*e.g.* dioptase, H_2CuSiO_4, and mica, *q.v.*). When present as hydroxyl it is often isomorphously replaced by fluorine (*e.g.*, topaz $[Al(F,OH)]_2SiO_4$).

As to the actual chemical constitution of minerals the little that is at present known is mainly speculative. Dimorphous minerals, which have the same empirical formula, may be expected to differ in constitution; and experiments have been made, for example on pyrite and marcasite, with the object of discovering a difference, but the conclusions of various investigators are not in agreement. More promising results have been obtained (by F. W. Clarke and others) by the action of various reagents on silicates, particularly on the more readily decomposed zeolites, and several substitution-derivatives have been prepared. The arrangement and relative positions of the constituent atoms have now been worked out for many minerals by X-ray methods of investigation.

Synthesis of Minerals.—The production of minerals by artificial means is a branch of chemical mineralogy which has been pursued with considerable success, especially by French chemists. Most minerals have been obtained artificially in a crystallized condition, and many related compounds, not as yet found in nature, have also been prepared. Crystals of artificially prepared minerals, though usually quite small in size, possess all the essential characters of natural crystals, differing from these only in origin. The following are the principles of some of the methods which have been used: simple sublimation (*e.g.* arsenolite); interaction of gases (*e.g.* haematite, from steam and ferric chloride; cassiterite, from steam and stannic chloride or fluoride); action of gases on liquids and solids; slow cooling of fused masses, either with or without the presence of *agents minéralisateurs* (*e.g.* minerals in furnace slags); from aqueous solution, sometimes at a high temperature and under pressure (*e.g.*, quartz); electrolysis; or even by subjecting dry amorphous material to enormous pressure. The chemical reactions by which various minerals have been obtained are often of considerable help in speculating as to their mode of origin in nature, though it must be borne in mind that the same mineral may have been formed, both naturally and artificially, by more methods than one. In this direction important results have been obtained experimentally by J. H. van't Hoff and his pupils on the formation of oceanic salt deposits, by J. H. L. Vogt with slags. A large amount of experimental work has been done in the geophysical laboratory of the Carnegie Institution at Washington. Many minerals and allied compounds have been prepared artificially in silicate and salt fusions. The conditions necessary for their formation and their ranges of stability—either when alone or when in the presence of other compounds—have been studied in detail. One important result obtained by experimenting over wide ranges of temperature has been to show that practically all compounds known as minerals exist in several polymorphous forms. Some few minerals used as gem-stones have been prepared artificially (*see* GEMS: *Artificial*).

II.—OCCURRENCE AND ORIGIN OF MINERALS

While some minerals are of rare and sporadic occurrence in rock-cavities and mineral-veins, others are widely distributed as important constituents of rocks. The same mineral-species may have several distinct modes of occurrence and origin, and be associated with different minerals in each case, for example quartz.

Minerals of Igneous Rocks.—The rock-forming minerals of primary origin in igneous rocks have crystallized out from the magma, or fused silicate-mass, which on consolidation gave rise to the rock-mass. Magmas sometimes contain a considerable amount of water and are then in a state of aqueo-igneous fusion, rather than of dry fusion; in such cases very coarsely crystalline rocks (pegmatites) often result, and under these conditions minerals of many kinds are formed as well-developed crystals. Those minerals which are present in large amount in igneous rocks are distinguished as essential constituents, since it is on these that the classification of igneous rocks is largely based: the most important are quartz, felspars, pyroxenes, amphiboles, micas and olivines. Other minerals occurring as primary constituents, but in small amounts, are distinguished as accessory. Sometimes these accessory constituents are concentrated by magmatic differentiation, and important ore-deposits sometimes result. Surface weathering and other processes result in the alteration of some or all of the primary minerals with the production of others, which are spoken of as secondary minerals: thus felspars are often partly or wholly altered to kaolin, olivine to serpentine, pyroxene and mica to epidote, chlorite, etc.

Minerals are also formed by the vapours given off by igneous magmas. The gases emitted by volcanoes and solfataras may deposit directly by sublimation, or by their chemical interaction, such minerals as sulphur, sal-ammoniac, haematite, which occur for instance, as incrustations on Vesuvian lava; the boric acid of the Tuscan lagoons has also originated in this way. The effects produced by the exhalations of deep-seated magmas are more complex in character, since the vapours, being more confined, have more opportunity of acting chemically not only on the surrounding rocks but also on the igneous rock-mass itself before its final consolidation. A good example of the "pneumatolytic" action produced by the vapours from a mass of granitic magma is afforded by veins of tin-ore, in which the ore (cassiterite) is associated with minerals containing boron and fluorine. In a similar way the exhalations of basic magmas have given rise to chlor-apatite with associated sphene and ilmenite.

Minerals of Metamorphic Rocks.—By the baking action of a deep-seated igneous mass on the surrounding rocks or on included rock-fragments, various new minerals are developed. By this process of thermal or contact-metamorphism well-crystallized examples of many minerals have often been formed; *e.g.* in calcareous rocks (limestones), especially those containing some magnesia and silica, idocrase, garnet, diopside, tremolite, wollastonite, etc., are developed; in argillaceous rocks (slates), chiastolite and staurolite are characteristic products; and in arenaceous rocks (sandstones), cordierite and sillimanite often result. The effects of pressure (dynamo-metamorphism) on rocks of various kinds, especially those of igneous origin, also result in the production of new minerals; *e.g.* pyroxene is transformed to amphibole, orthoclase to muscovite, plagioclase to zoisite, olivine to tremolite.

Minerals of Sedimentary Rocks.—By the weathering and disintegration of igneous and metamorphic rocks the various minerals set free and the products of decomposition of others supply the material of sedimentary rocks; thus sandstones consist largely of quartz, shales of kaolin and other clay minerals. Those minerals (*e.g.* gem-stones, cassiterite and gold) which resist the action of weathering processes are found as water-worn pebbles and grains in detrital deposits. Other sedimentary rocks consist of minerals deposited from solution either by chemical or organic agencies, from sea-water, lakes or springs; *e.g.* the calcite of limestones, deposits of bog-iron-ore (limonite), gypsum.

Minerals Segregated in Veins and Rock-cavities.—Water percolating through rock-masses takes up mineral matter in solution, and the solutions so formed may further react on the minerals composing the rocks. Such solutions will deposit some of their dissolved material in rock-cavities with the production of various minerals. For instance, the amygdaloidal cavities of basic volcanic rocks (*e.g.* basalt, melaphyre), are frequently partly or completely filled with agate or beautifully crystallized zeolites, calcite, etc. The crevices and joint-planes of limestone become in this way coated with crystals of calcite, and those of siliceous rocks with quartz, giving rise to the abundantly occurring quartz-

veins. In sedimentary rocks pyrite, flint and other minerals become segregated round a nucleus of organic matter. In the case of ore deposits, including metalliferous veins or lodes, however, the solutions are no doubt frequently of deep-seated origin and often connected with igneous and metamorphic processes. By the weathering of the metallic minerals of mineral-veins numerous other finely crystallized minerals result; for example, in the upper oxidized portion of veins of lead-ore (galena) crystals of anglesite, cerussite and pyromorphite are often met. (*See* ORE DEPOSITS.)

Alteration of Minerals: Pseudomorphs.—Crystals which have been formed under one set of conditions of temperature and pressure and in the presence of certain solutions, will in many cases be unstable under another set of conditions. The crystals may then be corroded or even completely redissolved, or the substance may undergo a chemical or physical change and give rise to the formation of minerals stable under the new conditions. An example of the secondary products due to the decomposition of a mineral is afforded by pyrite (FeS_2), of which two types of alteration may be distinguished. By oxidation in the presence of pure water it gives rise to ferrous sulphate (melanterite), free sulphur and sulphuric acid; the melanterite by further alteration gives various basic ferric sulphates (copiapite, etc.); and the sulphuric acid by acting on surrounding rocks (limestone, clay, etc.) gives rise to the formation of gypsum, aluminite and other sulphates. By the action of water containing oxygen and calcium carbonate in solution pyrite suffers another kind of alteration; the sulphur is carried away in solution as gypsum and the iron is left behind as a ferric hydroxide (limonite) which preserves the original form of the crystals. We have then a pseudomorph of limonite after pyrite.

Pseudomorphs are frequently met with in nature, and they are of considerable importance in studying the changes which minerals undergo. Several kinds of pseudomorphs are to be distinguished. When the alteration has involved no change in chemical composition of the material, but only in the internal crystalline structure and physical properties, the altered crystal is called a "paramorph." For example, crystals of aragonite are often altered to a confused granular aggregate of crystalline individuals of calcite, the change being accompanied by a decrease in specific gravity but without change in external form. An "epimorph" results from the encrustation of one mineral by another; the first may be afterwards partly or wholly dissolved out, leaving the second as a hollow shell (*e.g.* chalybite after fluor-spar).

III. NOMENCLATURE AND CLASSIFICATION OF MINERALS

A mineral-species, or simple mineral, is completely defined by the statement of its chemical composition and crystalline form. When we are dealing with a definite chemical compound the limitation of species is easy enough; thus corundum, cassiterite, galena, blende, etc. are quite sharply defined mineral species. But with isomorphous mixtures the division into species, or into subspecies and varieties, must be to a certain extent arbitrary, there being no sharp lines of demarcation in many isomorphous groups of minerals. Thus in the minerals garnet and tourmaline the chemical composition varies indefinitely between wide limits, but no corresponding difference can be traced in the crystalline form or in the external characters save colour and specific gravity. Some authors have therefore questioned the advisability of separating minerals into species each with distinctive names, and they have attempted to devise chemical names for the different kinds of minerals. Owing, however, to the frequency of polymorphism and isomorphism amongst mineral substances such a system presents many practical difficulties. Thus the three modifications of titanium dioxide are more simply and conveniently referred to as rutile, anatase and brookite, while to give a purely chemical designation to such a mineral as tourmaline would be quite impracticable.

The practice of giving distinct names to different kinds of minerals dates from very early times (*e.g.* diamond). The common termination *ite* (originally *itis* or *ites*) was adopted by the Greeks and Romans for the names of stones, the names themselves indicating some character, constituent, or use of the stone, or the locality at which it was found. For example, haematite, because of the blood-red colour. The custom of naming minerals after persons is of modern origin; *e.g.* prehnite, biotite, haüyne, zoisite. Unfortunately there is a lack in uniformity in the termination of mineral names, many long-established names being without the termination *ite*, *e.g.* beryl, blende, felspar, garnet, gypsum, quartz, zircon, etc. The termination *ine* is also often used, *e.g.* nepheline, olivine, serpentine, tourmaline, etc.; and many others were introduced by R. J. Haüy without much reason, *e.g.*, anatase, dioptase.

The number of known mineral species differs, of course, according to different authors; roughly there may be said to be about a thousand. The total number of mineral names (apart from chemical names), many of them being applied to trivial varieties or given in error, amount to about 6000.

Minerals may be classified in different ways to suit different purposes, *e.g.*, according to their uses, modes of occurrence, system of crystallization, etc. The earlier systematic classifications, being based solely on external characters, were on natural history principles and too artificial to be of any value. J. J. Berzelius, in 1815, was the first to propose a purely chemical system of classification; his primary divisions depended on the basic (electro-positive) element and the subdivisions on the acid (electro-negative) element. This method of classification, though still in use for metallic ores, is now quite arbitrary. The systematic classifications in use at the present day are modifications in detail of the crystallo-chemical system of G. Rose (1852). Here there are four main divisions, viz. elements; sulphides, arsenides, etc.; halogen compounds; and oxygen compounds: the last, and largest, division is subdivided into oxides and according to the acid (carbonates, silicates, sulphates and chromates, phosphates and arsenates, etc.); in each section isomorphous minerals are grouped together. The classifications adopted by different authors differ much in detail, especially in the large section of the silicates.

BIBLIOGRAPHY.—Elementary introductions to the study of minerals are: E. S. Dana, *Minerals and how to study them* (N.Y., 1895); L. J. Spencer, *The World's Minerals* (1911, N.Y. 1916). A larger work on popular lines is: R. Brauns, *The Mineral Kingdom*, Eng. trans. by L. J. Spencer (Stuttgart, 1908–12). Textbooks for students: H. A. Miers, *Mineralogy, an Introduction to the Scientific Study of Minerals* (1902); E. S. Dana, *Textbook of Mineralogy* (3rd ed., N.Y., 1922); and G. Tschermak, *Lehrbuch der Mineralogie* (9th ed., Vienna, 1923). The standard works of reference for descriptive mineralogy are: J. D. Dana, *System of Mineralogy* (6th ed., by E. S. Dana, N.Y., 1892, Appendices 1–3, 1899–1915); C. Hintze, *Handbuch der Mineralogie* (Leipzig, 1898, etc.).

For special branches of mineralogy reference may be made to the following: R. Brauns, *Chemische Mineralogie* (Leipzig, 1896); C. Doelter, *Handbuch der Mineralchemie* (4 vols., Dresden & Leipzig, 1911, etc.); H. Rosenbusch, *Mikroskopische Physiographie der Mineralien und Gesteine*, Band I., *Die petrographisch wichtigen Mineralien*, 5th ed., by O. Mügge (Stuttgart, 1925–27); J. P. Iddings, *Rock Minerals* (2nd edit., N.Y., 1911); G. P. Merrill, *Non-metallic Minerals, their Occurrence and Uses* (2nd edit., N.Y., 1910); T. Crook, *Economic Mineralogy* (1921); G. J. Brush, *Manual of Determinative Mineralogy* (16th ed., by S. L. Penfield, N.Y., 1907); M. Bauer, *Edelsteinkunde* (2nd ed., Leipzig, 1909), and Eng. trans. *Precious Stones*, by L. J. Spencer (1904).

There are many books on topographical mineralogy, for example: Greg and Lettsom, *Manual of the Mineralogy of Great Britain and Ireland* (1858).

The following scientific journals are devoted to mineralogy: *Neues Jahrbuch für Mineralogie*, etc. (Stuttgart, since 1807); *Tschermaks Mineralogische und petrographische Mitteilungen* (Vienna, since 1872); *The Mineralogical Magazine and Journal of the Mineralogical Society* (London, since 1876, including since 1920 *Mineralogical Abstracts*); *Zeitschrift für Krystallographie und Mineralogie* (Leipzig, since 1877); *Bulletin de la Société française de Minéralogie* (Paris, since 1878); *American Mineralogist* (Menasha, Wis., since 1916); *Fortschritte der Mineralogie, Kristallographie und Petrographie* (Berlin, since 1911).
(L. J. S.)

MINERAL PHOSPHATES. In mineralogy, those varieties of native calcium phosphate which are not distinctly crystallized, like apatite (*q.v.*), but occur in fibrous, compact or earthy masses, often nodular, and more or less impure, are included under the general term phosphorite. The name seems to have been given originally to the Spanish phosphorite, probably because it phos-

VALUABLE AND BEAUTIFUL MINERALS FROM MANY LANDS

1. Fluorite, or Fluor Spar, from Westmoreland, New Hampshire
2. Pyrite, "fool's gold," from Central City, Colorado
3. Cinnabar, native vermilion, from Felsobanya, Hungary
4. Copper, man's first useful metal, from Cornwall, England
5. Rhodonite, manganese ore, from Franklin Furnace, New Jersey
6. Hematite, iron ore, from Cumberland, England
7. Rhodochrosite, manganese ore, from Leadville, Colorado
8. Cassiterite, tin-stone, from St. Agnes, Cornwall, England
9. Gold nugget, from the Klondike, Northwestern Canada
10. Labradorite, with rainbow colours, from Labrador
11. Realgar, arsenic sulphide, from Manhattan, Nevada
12. Crocidolite, "tiger's eye," from Griqualand, South Africa
13. Sulphur, from Cianciana, Sicily

phoresced when heated. This mineral, known as Estremadura phosphate, occurs at Logrossan and Cáceres, where it forms an important deposit in slate. It may contain from 55 to 62% of calcium phosphate, with about 7% of magnesium phosphate. Dahllite is a Norwegian phosphorite, containing calcium carbonate, named in 1888 by W. C. Brögger and H. Bäckström after the Norwegian geologists T. and J. Dahll.

Phosphorite, when occurring in large deposits, is a mineral of much economic value for conversion into the superphosphate largely used as a fertilizing agent. Many of the impure substances thus utilized are not strictly phosphorite, but pass under such names as "rock-phosphate," or, when nodular, as "coprolite" (q.v.), even if not of true coprolitic origin. The ultimate source of these mineral phosphates may be referred to the apatite widely distributed in crystalline rocks. Being soluble in water containing carbonic acid or organic acids it may be removed in solution, and may thus furnish plants and animals with the phosphates required in their structures. On the decay of these structures the phosphates are returned to the inorganic world, thus completing the cycle.

There are three sources of phosphates which are of importance geologically. They occur (*a*) in crystalline igneous and metamorphic rocks as an original constituent, (*b*) in veins associated with igneous rocks, and (*c*) in sedimentary rocks either as organic fragments or in secondary concretionary forms.

The first mode of occurrence is of little significance practically, for the crystalline rocks generally contain too little phosphate to be valuable, though occasionally an igneous rock may contain enough apatite to form an inferior fertilizing agent, *e.g.*, the trachyte of Cabo de Gata in south-east Spain, which contains 12–15% of phosphoric acid. Many deposits of iron ores found in connection with igneous or metamorphic rocks, and the oolitic iron ores, such as those of the Jurassic system in England and Lorraine, contain from 1 to 2% of phosphorus, which passes into the slags in the basic process of steel-making, and forms a very important source of phosphatic manures ("basic slag").

Another group of phosphatic deposits connected with igneous rocks comprises the apatite veins of south Norway, Ottawa and other districts in Canada. These are of pneumatolytic origin (*see* PNEUMATOLYSIS), and have been formed by the action of vapours emanating from cooling bodies of basic eruptive rock. They once formed an important source of phosphate, but are now worked out.

The phosphatic rocks which occur among the sedimentary strata are the principal sources of phosphates for commerce and agriculture. They are found in formations of all ages from the Cambrian to those which are accumulating at the present day. Of the latter the best known is guano. (*See* MANURES and MANURING.)

Where guano-beds are exposed to rain their soluble constituents are removed and the insoluble matters left behind. The soluble phosphates washed out of the guano may become fixed by entering into combination with the elements of the rock beneath. Many of the oceanic islets are composed of coral limestone, which in this way becomes phosphatized; others are igneous, consisting of trachyte or basalt, and these rocks are also phosphatized on their surfaces but are not so valuable, inasmuch as the presence of iron or alumina in any quantity renders them unsuited for the preparation of artificial manures.

The leached guanos and phosphatized rocks, which are grouped with them for commercial purposes, have been obtained in great quantities in many islands of the Pacific Ocean (such as Baker, Howland, Jarvis and McKean Islands) between long. 150° to 180° W. and lat. 10° N. to 10° S. In the West Indies from Venezuela to the Bahamas and in the Caribbean Sea many islands yield supplies of leached guanos; the following are important in this respect: Sombrero, Navassa, Aves, Aruba, Curaçao. Christmas Island has been a great source of phosphates of this type; also Jaluit Island in the Maldive Archipelago, Banaba or Ocean Island, and Nauru or Pleasant Island. On Christmas Island the phosphate has been quarried to depths of 100 feet. To these leached guanos and phosphatized limestones the name sombrerite has been given. It has been estimated that 500,000 tons of phosphate were obtained in Aruba, 1,000,000 tons from Curaçao since the deposits were discovered in 1870, and Christmas Island in 1925 yielded 110,000 tons.

In the older formations the phosphates tend to become more and more mineralized by chemical processes. In whatever form they were originally deposited they often suffer complete or partial solution and are redeposited as concretionary lumps and nodules, often called *coprolites* (*q.v.*). The "Challenger" and other oceanographic expeditions have shown that on the bottom of the deep sea concretions of phosphate are now gathering around the dead bodies of fishes lying in the oozes; consequently the formation of the concretions may have been carried on simultaneously with the deposition of the strata in which they occur.

Important deposits of mineral phosphates are now worked on a large scale in the United States, the annual yield far surpassing that of any other part of the world. The most active operations are carried on in Florida, where the phosphate was first worked in 1887 in the form of pebbles in the gravels of Peace river. Then followed the discovery of "hard rock-phosphate," a massive mineral, often having cavities lined with nearly pure phosphorite. Other kinds not distinctly hard and consisting of less rich phosphatic limestone, are known as "soft phosphate"; those found as smooth pebbles of variable colour are called "land pebble-phosphate," whilst the pebbles of the river-beds and old river-valleys, usually of dark colour, are distinguished as "river pebble-phosphate." The land pebble is worked in central South Florida; the hard rock chiefly between Albion and Bay City. In South Carolina, where there are important deposits of phosphate, formerly more productive than at present, the "land rock" is worked near Charleston, and the "river rock" in the Coosaw river and other streams near Beaufort. The phosphate beds contain Eocene fossils derived from the underlying strata and many fragments of Pleistocene vertebrata such as mastodon, elephant, stag, horse, pig, etc. The phosphate occurs as lumps varying greatly in size, scattered through a sand or clay; they often contain phosphatized Eocene fossils (Mollusca, etc.). Sometimes the phosphate is found at the surface, but generally it is covered by alluvial sands and clays. Phosphate mining began in South Carolina in 1868, and for twenty years that state was the principal producer. Then the Florida deposits began to be worked. In 1892 the phosphates of Tennessee, derived from Ordovician limestones, came into the market. From North Carolina, Alabama and Pennsylvania, also, phosphates have been obtained but only in comparatively small quantities. In 1900 mining for phosphates was commenced in Arkansas. In 1908 Florida produced 1,673,651 tons of phosphate valued at 11 million dollars. All the other states together produce less phosphate than Florida, and among them Tennessee takes the first place with an output of 403,180 tons.

Algeria contains important deposits of phosphorite, especially near Tebessa and at Tocqueville in the province of Constantine. Near Jebel Kouif, on the frontier between Algeria and Tunis, there are phosphate workings, as also in Tunis, at Gafsa. The deposits belong to the Lower Eocene, where it rests unconformably upon the Cretaceous. The joint production of Tunis and Algeria in 1927 was not less than 3,748,000 tons. Phosphates occur also in Egypt, in the desert east of Keneh and in the Dakla oasis in the Libyan desert.

France is rich in mineral phosphates, the chief deposits being the departments of the Pas-de-Calais, Somme, Aisne, Oise and Meuse, in the north-east, and another group in the departments of Lot, Tarn-et-Garonne and Aveyron, in the south-west; phosphates occur also in the Pyrenees. The deposits near Caylus and in Quercy occupy fissures and pockets in Jurassic limestone, and have yielded a remarkable assemblage of the relics of Tertiary mammals and other fossils. Phosphates occur in Belgium, especially near Mons, and these, like those of north-east France, are principally in the Upper Chalk. Two varieties of phosphate rock are recognized in these districts, viz., the phosphatic chalk and the phosphate sand, the latter resulting from the decomposition of the former. Large and valuable deposits of the sand have been obtained in sinks and depressions on the surface of the chalk. The production is on the whole diminishing in Belgium (172,000

tons in 1927), but in France by this time it has become nearly, or very nearly, extinct.

In the Lahn district of Nassau (Germany) there are phosphate beds in Devonian rocks. The deposits were rich but irregular and local, and were much worked from 1866 to 1884, but are no longer of economic importance. In northern Estremadura in Spain and Alemtejo in Portugal there are vein deposits of phosphate of lime. As much as 200,000 tons of phosphate have been raised in these provinces, but in 1927 Spain was not mentioned in the list of producers. Large deposits of phosphate occur in Russia, and those in the neighbourhood of Kertch have attracted some attention; it is said that the Cretaceous rocks between the rivers Dniester and Volga contain very large supplies of phosphate, though probably of low grade.

Phosphatic nodules and concretions, with phosphatized fossils and their casts, occur at various geological horizons in Great Britain. Bands of black nodules, highly phosphatic, are found at the top of the Bala limestone in North Wales; beds of concretions occur in the Jurassic series; and important deposits are known in the Cretaceous strata, especially in the Lower Greensand and at the base of the Gault. The Lower Greensand phosphates have been worked, under the name of "coprolites," at Potton in Bedfordshire and at Upware and Wicken in Cambridgeshire. The Cambridge Greensand, rich in phosphatic nodules, occurs at the base of the Chalk Marl. The chalk occasionally becomes phosphatized, as at Taplow (Bucks), Lewes (Sussex) and Ciply in Belgium. At the base of the Red Crag in East Anglia, and occasionally at the base of the other Pliocene Crags, there is a "nodule bed," consisting of phosphatic nodules, with rolled teeth and bones, which were formerly worked as "coprolites" for the preparation of artificial manure. Lord Rayleigh has found that phosphatized nodules and bones are rich in radioactive constituents, and has brought this into relation with their geological age.

BIBLIOGRAPHY.—For American phosphates see ***The Phosphates of America***, by Francis Wyatt (5th ed., 1894); the Annual Reports on ***Mineral Resources of the U.S.*** (U.S. Geol. Survey), including some valuable reports by C. W. Hayes, also those in Rothwell's ***Mineral Industry***; "Nature and Origin of Deposits of Phosphate of Lime," by R. A. F. Penrose, Jun., *Bull. U.S. Geol. Survey*, No. 46 (1888); ***Florida, South Carolina and Canadian Phosphates***, by C. C. Hoyer Miller (1892); and ***The Non-metallic Minerals***, by G. P. Merrill (1904). Many of the above include descriptions of mineral phosphates in other parts of the world. For a general discussion of the origin of the phosphates, *see* "The Natural History of Phosphate Deposits," by J. J. H. Teall, *Proc. Geol. Assoc.*, xvi. 369 (1900). Consult also ***Étude complète sur les phosphates***, by A. Deckers (Liége, 1894).

MINERAL RIGHTS DUTY: *see* INLAND REVENUE DUTIES.

MINERAL WATERS. The number of mineral waters in various parts of the world is so great that a comprehensive list cannot be given. In the accompanying tables are presented short notes of the chief with their dominating characters and indications for their use in medicine. In many instances detailed information can be readily obtained from the various official handbooks issued. As to the action of mineral waters in general (*see* BALNEOTHERAPEUTICS; BATHS) there is so large a social and commercial element in all spas that the medical side, viewed from a strictly scientific standpoint, is much obscured. Where the water contains a special substance (*e.g.*, arsenic, as in some French springs, lithium, radium or radium emanation) it is usually regarded as dominating the character of the water and the uses to which it should be put medically. *See* also AERATED WATERS and SOFT DRINKS.

TABLE II. *Indifferent Waters*

Locality	Height in ft.	Temp. °Fahr.	For what prescribed
Evian, Lake of Geneva	1,100	..	Nervous cases, dyspepsia, urinary affections.
Badenweiler, Baden .	1,425	..	For mild rheumatic treatment; a health resort.
Buxton, England .	980	82	Gout and rheumatism (nitrogen present).
Schlangenbad, Nassau	800	80–87	Nervous cases, female disorders, skin.
Sacedon, Spain . .	1,500	85	Rheumatism, gout, cutaneous affections.
Wildbad, Württemberg	1,320	90–101	Gout and rheumatism, neuralgia, thickenings.
Pfeffers, Switzerland .	2,115	99	Do. do. do.
Ragatz, do. . .	1,570	95	Do. do. do.
Panticosa, S. Pyrenees	5,110	85–95	Do. (nitrogen present); special action in phthisis.
Teplitz, Bohemia .	648	101–120	Gout, rheumatism, old injuries, joints or bones.
Gastein, Austria . .	3,315	95–118	Do. do.; soothes nervous system.

TABLE III. *Earthy Waters*

	Locality	Height in ft.	Temp. °Fahr.	Therapeutic action
Cold	Contrexéville, Vosges	1,050	..	Special action in calculous affections.
	Lippspringe, North Germany . .	..	..	Supposed to be useful in phthisis.
	Wildungen, do. .	..	..	Special use in urinary complaints; contains iron.
	Weissenberg, Switzerland . . .	2,600	..	Resorted to for pulmonary affections.
	Pougues, France .	600	..	Dyspepsia, diabetes, hepatic and urinary concretions.

TABLE III. *Earthy Waters*—continued

	Locality	Height in ft.	Temp. °Fahr.	Therapeutic action
	Baden, Switzerland	1,180	117–122	Rheumatism, gout, paralysis, scaly eruptions.
	Leuk, do.	4,400	93–123	Do., some female complaints.
	Bormio, North Italy	4,400	86–104	Do. do.; old sprains.
Warm	Lucca, Italy	..	108–122	Do. do. do.
	Bath, England	..	108–122	Do. do. do.
	Dax, south of France	1,400	139	Do. do.
	B. de Bigorres, Pyrenees	1,800	64–123	Do.; chlorosis, neuralgia.

TABLE IV. *Salt Springs*

	Locality	Temp. °Fahr.	Therapeutic action
Cold	Soden, near Frankfort	..	Dyspepsia, anaemia, scrofula, special for throat and phthisis.
	Homburg, do.	..	Dyspepsia, slighter hepatic affections, chlorosis, gout.
	Kissingen, Bavaria	..	In all essentials the same.
	Pyrmont, North Germany	..	Better known for its iron; has a good salt drinking spring.
	Kreuznach, near Bingen	..	A salt well without carbonic acid; used in scrofula and anaemia; bathing more important.
Warm	Wiesbaden, Nassau	155	Used in dyspepsia and gout; the bathing is most important.
	Baden-Baden	156	Still milder water; uses similar; gout.
	Bourbonne, Haute-Marne	114–149	Rheumatism, neuralgia, effects of malaria.
	Balaruc, South France	116·6	Do.; special for treatment of paralysis.
	Salins, Moutiers, Savoy (1,480ft.)	96	Scrofula, anaemia, loss of power, sexual disorders.
	Brides, Savoy (1,700 ft.)	95	Act on liver and digestive canal; used for obesity.
	Acqui, North Italy	169	Rheumatism; special treatment with the bath deposit.
	Abano, do.	185	Chiefly as baths; mud of bath used for poultice.
	Caldas de Mombuy, near Barcelona	153–158	Rheumatism, sciatica, old injuries.
	Cestona, Guipuzcoa, Spain	88–94	Rheumatism, indigestion, bronchitis.

Almost all the above named stations have several springs of various strengths: the cold may be said to vary from 14 to 5·8% of chloride of sodium; the warm are generally weaker, perhaps varying from 6·8 to 1·6. In several, minute traces of iodine or bromine are found.

TABLE V. *Stronger Salt Waters*

Locality	Chloride of Sodium in 1,000 parts of Water	Therapeutic application
Rheinfeld, Aargau, Switzerland	311	Scrofula, effects of inflammation, chronic exudations, some chronic exanthemas, rheumatism, uterine infiltrations.
Salzungen, North Germany	256	Do. do.
Ischl, Austria (1,440ft.)	256	Do. do.
Hall, Tyrol (1,700ft.)	255	Do. do.
Reichenhall, near Salzburg (1,800ft.)	224	Do. do.
Bex, Rhone Valley (1,400 ft.)	156	Do. do.
Castrocaro, Tuscany	36	Do. do.
Droitwich, near Worcester	233·6	Do. do.
Sea Water	30·4	Do. do.
Rehme, Westphalia (92° F)	24–85	Do.; special use in locomotor ataxia.
Nauheim, Wetterau (80°–103° F)	29	Do. do.

TABLE VI. *Iron Waters*

Locality	Height in ft.	Carb. of iron	Therapeutic use
Rippoldsau, Black Forest	1,886	0·12	For anaemic conditions; laxative.
Homburg, near Frankfort	..	0·10	Do. do.
Elster, Saxony	1,465	0·08	Do. do.
Liebenstein, North Germany	911	0·08	Do. do.
Schwalbach, Nassau	900	0·08	Do.; much of a ladies' bath.
Bocklet, near Kissingen	600	0·08	Do.
Griesbach, Black Forest	1,614	0·07	Do.; laxative; a ladies' bath.
Franzensbad, Bohemia	1,293	0·07	Do. do.
Pyrmont, Germany	..	0·07	Do.
Spa, Belgium	1,000	0·06	Do.
Petersthal, Black Forest	1,333	0·04	Do.; laxative.
St. Moritz, Engadine, Switzerland	5,464	0·03	Do.; sought for its air.
Forges-les-Eaux, France	..	0·06	Do.
La Malou, Hérault, France (temp. 88°)	..	0·08	Do.
Recoaro, North Italy	1,943	0·04	Do.
Tunbridge Wells	..	0·06	Do.; deficient in carbonic acid.
Muspratt Spring, Harrogate (chloride)	600	0·15	

TABLE VII. *Cold Sulphur Springs*

Locality	Sulphuretted Hydrogen dissolved in water	Sulphide of Sodium
Eilsen, Schaumburg-Lippe	42·3	..
Meinberg, Lippe-Detmold	23·1	0·008
Gurnigel, Switzerland (3,600ft.)	15·1	..
Leuk, do. (3,593ft.)	44·5	..
Challes, Savoy (900ft.)	..	0·478
Enghien, near Paris	..	0·106
Uriage, Isère, France (1,500ft.)	7·34	..
Harrogate, England	..	0·207
Strathpeffer, Scotland	..	0·026
Lisdoonvarna, Clare, Ireland	..	..

TABLE VIII. *Warm Sulphur Springs*

Locality	Height in ft.	Temp. °Fahr.	Hydrosulphuric acid absorbed in water	Sulphide of Sodium
Aix-la-Chapelle, Germany	534	131–140	0·3	0·01
Baden, near Vienna	..	95–115	2·5	0·052
Schinznach, Switzerland	1,060	80–92	37·8	..
Lavey, Rhone Valley	1,350	92–113	3·5	..
Hercules Bad, Banat	500	110	42·6	..
Aix-les-Bains, Savoy	765	108·5	27·2	..
Luchon, Pyrenees	2,000	135·5	..	0·07
Barèges, do	4,100	113	..	0·04
Amélie-les-Bains, Pyrenees	810	87–147	..	0·01
Cauterets, do.	3,254	71–134	..	0·02
Eaux Bonnes, do.	2,400	90·5	..	0·02
Archena, Murcia, Spain	..	126	..	..

TABLE IX. *Alkalic Waters* Class I. *Simple Alkalines*

Locality	Carb. Soda	Therapeutic uses
Vals, South France	7·1	Catarrh of stomach, gout, renal and biliary calculi, liver complaints, diabetes.
Bilin, Bohemia	4·2	Do. do. do.
Vichy, France (105° F)	5·1	Do. do. do.
Neuenahr, Rhineland (92°–97° F)	1·0	Mucous catarrh; diabetes specially.
La Malou, France (97° F)	..	Do.; sedative effect on nervous system.
Vidago, Portugal	..	Do.; gout, urinary affections.

Class II. *With Chloride of Sodium varying from 4·3 to 1 in amount*

Locality	Height in ft.	Temp. °Fahr.	Carb. Soda	Therapeutic uses
Luhatschowitz, Moravia	1,600	..	8·4	Springs rich both in carb. soda and chl. sodium.
Tönnistein, Rhine Valley	..	..	2·5	Light antacid tonic to stomach.
Ems, Nassau	..	85–115	2·0	Special in female complaints and mucous membrane.
Ischia, Italy	..	up to 170	2·0	Specially rheumatism and female complaints.
Royat, Auvergne	1,400	80–95	1·3	Do. and some skin affections.
Mont Dore, do.	3,300	100–114	..	Asthma, chronic laryngitis.
Bourboule, do.	2,800	107–125	..	Scrofula, rachitis, cutaneous affections.

Class III. *With Sulphate of Soda varying from 5·2 to 2 in amount, and Carbonate of Soda varying from 3·55 to 0·51 in amount*

Locality	Height in ft.	Therapeutic uses
Elster, Saxony	1,460	Action on abdominal organs, female complaints.
Marienbad, Bohemia	1,012	Do.; special use in obesity.
Franzensbad, do.	1,293	Do.; specially a ladies' bath.
Tarasp, Lower Engadine	4,000	Powerful action on abdominal viscera.
Carlsbad, Bohemia (121°–164° F)	1,200	Gout, liver affections, biliary and renal calculi, diabetes.

Table X. *American Mineral Waters*

	Designation and locality	Therapeutic application
Indifferent (Thermal)	Lebanon, Columbia co., N. Y. (73° F)	
	Healing, Bath co., Va. (88° F)	Scrofulous ulcers and ophthalmia, ozoena, chronic diarrhoea and dysentery, secondary and tertiary syphilis.
	Warm, Bath co., Va. (98° F)	Chronic and subacute rheumatism, gout, neuralgia, nephritic and calculous diseases.
	Hot, Bath co., Va. (110° F)	Chronic rheumatism, gout, diseases of liver, neuralgia, contractions of joints.
	Paso Robles, San Luis Obispo co., Cal. (122° F)	
	Hot, Garland co., Ark. (93-150° F)	Dartrous diseases of skin, functional diseases of uterus, chronic mercurial and lead poisoning.
Calcareous and Earthy	Gettysburg, Adams co., Penn.	Calculus, gravel, catarrh of stomach or bladder, dyspepsia.
	Sweet, Monroe co., W. Va. (74° F)	Gravel, dyspepsia (diuretic, diaphoretic).
	Berkeley, Morgan co., W. Va (74° F)	Neuralgia (restorative).
	Alleghany, Montgomery co., Va.	Purgative, diuretic.
	Bethesda, Waukesha co., Wis.	Diabetes mellitus, gravel, inflammation of bladder, dropsy, albuminuria (diuretic)
Sulphur	Lower Blue Lick, Nicholas co., Ky.	Aperient and alterative.
	Sharon, Schoharie co., N. Y.	Do. do.
	White Sulphur, Greenbrier co., Va.	Dartrous skin diseases, diseases of the bladder, jaundice, dyspepsia.
	Salt Sulphur, Monroe co., W. Va.	Do.; scrofula and syphilis.
Epsom Salt	Bedford, Bedford co., Penn.	Anaemia, gravel, calculus (strongly diuretic).

Table X. *American Mineral Waters*—continued

	Designation and locality	Therapeutic application
Common Salt	St. Catharine's, Ontario, Canada	Rheumatism, gout, scrofula, neuralgia.
	Caledonia, Ontario, Canada	Rheumatism, gout.
	Hathorne, Saratoga, N. Y.	Dyspepsia, jaundice, abdominal plethora.
	Ballston, Saratoga co., N. Y.	Do. do. do.
Iron	Oak-Orchard Acid, Genesee co., N. Y.	Ulcers, diseases of the skin, passive haemorrhages, atonic diarrhoea (has 10 grains of free sulphuric acid in the pint).
	Rawley, Rockingham co., Va.	Chlorosis and anaemia generally, tonic.
	Sweet Chalybeate, Alleghany co., Va.	Do. do. do.
	Rockbridge Alum, Rockbridge co., Va.	Scrofula, chronic diarrhoea.
	Cooper's Well, Hinds co., Miss.	Anaemia, chlorosis, chronic diarrhoea, dropsy.
Glauber Salt	Crab Orchard, Lincoln co., Ky.	
	Midland, Midland co., Mich.	
Alkaline	Bladen, Choctaw co., Ala. (carbonated alkaline)	
	Congress, Santa Clara co., Cal. (saline-alkaline)	
	St. Louis, Gratiot co., Mich. (simple alkaline)	Dyspepsia, neuralgia, chronic and subacute rheumatism.

Fitch, *Mineral Waters of the United States and American Spas* (1927).

United States.—The term "mineral water" is employed to connote water of high mineral content as well as all water bottled and sold for table or medicinal use without appreciable alteration from its natural state. Some of these waters contain considerably less mineral matter than many of the public water supplies. A mineral content of less than 10 grains per gallon is considered low, 30 grains high, and over 100 grains very high. It is estimated that there are over 10,000 mineral springs in the United States. Mineral waters are employed for medicinal purposes, as table

waters in place of public water supplies, and for the manufacture of soft drinks, particularly carbonated beverages.

MINERAL WELLS, a city of Palo Pinto county, Texas, U.S.A., 45 m. W. of Fort Worth, near the Brazos river; on Federal highway 80, and served by the Gulf, Texas and Western and the Weatherford, Mineral Wells and North Western railways. Pop. (1920) 7,890, and in 1930, 5,986 by Federal census. It is primarily a health and pleasure resort. More than 150,000 visitors come annually to drink the waters and take the baths. The water is bottled for shipment in one of the largest plants of the kind in the world. The city was founded in 1880 and incorporated in 1885.

MINERS MILLS, an anthracite-mining borough of Luzerne county, Pennsylvania, U.S.A., 3 m. N.E. of Wilkes-Barre; served by the Central of New Jersey, the Delaware and Hudson, and the Lehigh Valley railways. Pop. (1920) 4,365 (29% foreign-born white). It was annexed to Wilkes-Barre in 1929.

MINERS PERMANENT RELIEF SOCIETIES: *see* FRIENDLY SOCIETIES.

MINERS' PHTHISIS. Almost any dust inhaled in sufficient quantity may cause chest trouble, but certain dusts are related to the occupational disease variously known as miners' phthisis, pneumonoconiosis, grinders' rot, potters' rot, stonecutters' rot, etc.

Phthisis-producing Dusts.—Dusts with this association are often referred to as phthisis-producing dusts, because pulmonary tuberculosis plays a more or less important part in this disease and is always associated with a fatal termination and usually with disablement. E. L. Collis has shown that the phthisis-producing dust of far the greatest importance in industry is dust of free silica (SiO_2) and the disease is often known as "Silicosis." For a dust to be phthisis-producing it must be comparatively insoluble and inert and the particles must be minute, say from five microns downwards, or about the size of the common pathogenic micro-organisms. Owing to their minute size these particles may be present in air in dangerous concentration without being visible to the eye or in any other way noticeable to the senses, so in a phthisis-producing industry it is expedient to sample the air for dust as one samples for gas in a "gassy" mine.

The Lungs and Dust.—The lungs have a very considerable power of ridding themselves of inhaled particles, and some dusts, like coal-dust, are much more readily got rid of than others while, in the case of a phthisis-producing dust, accumulation readily gets ahead of elimination, so quite small quantities of air-borne dust may be dangerous. It is owing to this cumulative factor that duration and continuity of exposure are of importance as well as concentration in the air. While the average incidence of miners' phthisis in the gold-mines of the Witwatersrand is under 3% per annum of the underground population, the incidence rises as high as 10% per annum among miners of 13 years' service and over.

A certain proportion of the fine dust inhaled runs the gauntlet of the upper respiratory passages and gets right down into their minute blind extremities, the alveoli. In silicosis as in pulmonary tuberculosis "lesion means arrest" and the dust particles are arrested by being taken up by certain cells often called dust cells. These are phagocytic endothelial cells and, when dust-laden, they aggregate forming masses or pseudo-tubercles on the alveolar walls, under the pleura and in the lymphatic channels which they obstruct. The pseudo-tubercles tend to degenerate and become replaced by fibrous tissue, thus forming the fibroid nodules characteristic of the early stage of silicosis.

Prevention.—It is the fine dust that matters and, in mines where a phthisis-producing rock is dealt with, the chief sources of fine dust are blasting and rock-cutting with machines. From the point of view of prevention, in industries where blasting is practised, the workers should not return to the working-place until after all dust and fume have been blown away. Ventilation with good currents of dust-free air is the great safeguard because, by treating the air-borne dust as a gas, it can be diluted down towards a safe level. With daily exposure over many years, perhaps about one milligramme of dust per cu. metre of air is a safe level. The fine dust is only a small proportion by weight of the total air-borne particles, but includes the majority of particles by enumeration. A sample of air-borne dust of 2 milligrammes per cu. metre as determined by the method in use on the Witwatersrand corresponds to about 350 particles of fine dust per cu.cm. of air (counted by Kitze koniometer). The other great safeguard is "working wet" as the chief source of the dust associated with machine drilling is "sludging" with air. When it is practicable to sludge with water only, machines raise much less dust. Water-sprays should be in continuous use and the roof, walls and floor of the working-place kept wet (*see* MINING).

A machine may be in good order for rock-cutting and in bad order for dust-control and should be inspected from the latter point of view as well as the former. A hand-drill is more difficult to keep in order for dust-control than is the larger machine and it is doubtful if it is possible to secure safe conditions if hand-drills are used dry when cutting phthisis-producing rock. In all phthisis-producing industries, apart from working wet, it is wise to think of the fine air-borne dust as a gas and make use of exhaust-hoods and abstractors; while sources of dust escaping to the air should, as far as possible, be located and enclosed.

There are two important factors in the severe forms of miners' phthisis:—

(1) The phthisis-producing dust.
(2) The tubercle bacillus.

The modern view of pulmonary tuberculosis as met with in the adult population of civilized countries is that it is contracted from an active case by inhalation. Under experimental conditions the presence of dust in the air, together with the tubercle bacillus, renders the susceptible animal much more liable to infection by inhalation. It is on account of this association that, in a phthisis-producing industry, one must strive not only to eliminate dust but also to eliminate the tubercle bacillus. The only practicable step towards the latter ideal is to detect and remove the "carrier," *i.e.*, the sufferer from open tuberculosis.

(A. MA.)

MINERSVILLE, a borough of Schuylkill county, Pennsylvania, U.S.A., on the Schuylkill river, 4 m. W. of Pottsville. It is served by the Pennsylvania and the Reading railways. Pop. (1920) 7,845; and in 1930 it was 9,392. Anthracite mining is the chief industry, and there are several factories. The borough was settled about 1790 and incorporated in 1831.

MINERVA, an Italian goddess, subsequently identified with Athena; also MENERVA, from *mens*, mind. She presided over all handicrafts, including professions and arts. Besides her Etruscan cult in the capitol, she had at Rome, before 207 B.C., a temple on the Aventine, which was from the time of Livius Andronicus (q.v.) the meeting-place for guilds of craftsmen, including dramatic poets and actors. The dedication day of the temple was March 19, called *quinquatrus*, because it fell on the fifth day after the Ides. Properly this was a festival of Mars, but it came to be considered Minerva's day, apparently from the accident that her temple had been founded then. She herself was confused with Nerio, the cult-partner of Mars. All the schools had holidays at this time, and the pupils, on reassembling, brought a fee (*minerval*) to the teachers. At a later time the festival extended over five days. Her later cult is wholly modelled on that of Athena. There was another shrine of Minerva on the Caelian hill, where she was worshipped under the name of Capta, the "captive." This cult was brought to Rome on the capture of Falerii, 241 B.C. Here a festival called the lesser *quinquatrus* was celebrated on June 13 and 14, chiefly by the flute-players (Livy ix. 30; Ovid, *Fasti* vi. 651). *See* also PALLADIUM.

MINES, MINELAYING AND MINESWEEPING. A submarine mine is a weapon used for the attack and defence of harbours and anchorages or to deny the use of certain areas of water to ships. Briefly, it consists of a charge of explosive, contained in a water-tight case, intended by its explosion to put out of action a hostile vessel of any class it is designed to act against. Prior to 1870 the term "torpedo" was used for all explosive

charges fired in the water, but since that date the word "torpedo" has been restricted to the mobile torpedo (*see* TORPEDOES). Although the scientific development of submarine mining warfare is the work of the last sixty years, attempts to use drifting charges against ships and bridges are recorded as early as the 16th century. Mines were used by the Americans in 1777, and in 1780 Robert Fulton produced an explosive machine which he called a "torpedo," and which was experimented with, not very successfully, up to 1815. In 1854, the Russians used mechanical mines in the Baltic, but without any marked success.

The first application of electricity to the explosion of submerged charges was made by Sir Charles Pasley in the destruction of wrecks in the Thames and of the wreck of the "Royal George" at Spithead in 1839 and subsequent years. The first military use of electrically-fired mines was made in the American Civil War of 1861–65 when several vessels were sunk or damaged by mines or torpedoes. From this date onwards most European nations experimented with mines, and they were actually used during the Franco-German War of 1870, the Russo-Turkish War of 1878 and the Spanish-American War of 1898. The most interesting example of mine warfare prior to the World War was in the attack and defence of Port Arthur during the Russo-Japanese War of 1904–05. Both sides used mechanical mines only, and both suffered heavy losses from the mine warfare. Mines and torpedoes were first introduced into the English service about 1863, defence mines being placed in the charge of the Royal Engineers, while torpedoes were developed by the Royal Navy. In 1904 the responsibility for all mining work was placed on the Navy. As a rule mines are moored, but mines which drift with the tide or current are occasionally used for special purposes.

Any explosive can be used in submarine mines provided adequate means are provided to explode the charge. The detonators for electrically fired mines are fired by heating a small length of wire, termed a "bridge," round which is placed a priming which burns and detonates a small charge of fulminate of mercury, lead azide or similar explosive, which in turn detonates the main charge. The detonator for mechanically fired mines is exploded by the friction of the striker entering it. The charge is contained in a steel mine case which also contains the necessary electrical or mechanical arrangements for firing the mine. For buoyant mines the cases must have sufficient air space to provide the necessary buoyancy. The size of the mine case will therefore depend principally on the weight of charge and the buoyancy required, the latter varying according as the mine is to be laid in still water or in currents or tides, and according to the depth of water and consequent weight of mooring rope. The cases are moored to the sea bed by a heavy weight called a "sinker," the connection being made by a flexible steel wire rope or, in electrically controlled mines, by the electric cable itself. Various proposals have been made for including in a mine some apparatus which will compensate for the rise and fall of the tide and enable the mine to be kept at the pre-arranged depth all the time. Submarine mines may be divided into two main classes, "controlled" and "non-controlled."

Controlled Mines.—These are fired by electricity and are connected by electric cables to a shore station where means are provided for switching off the current, thus rendering the mines inert and harmless during the passage of friendly vessels. They are thus absolutely under the control of the operator on shore, their condition is always accurately known from the testing apparatus at the shore station and if any break adrift from their moorings the mines are harmless. It should be noted that *all* mines are supposed to be harmless if they break adrift. Controlled mines take longer to prepare and lay than non-controlled mines, as the electric cables have to be laid and jointed, and more skill and training is required to lay and maintain a minefield. They can be arranged on two systems according to the method to be employed to effect the exact moment to fire the charge. These methods are by *observation* or by *circuit closer*.

In the *observation* system, the exact position of the mines when laid is marked on a special chart, on which the track of any ship crossing the minefield can also be plotted. The operator in the shore station plots the track and when it is seen to be crossing the position of a mine he closes a switch and the mine is fired. The mines themselves are placed either on the sea bed or at depths well below the bottom of any friendly ships, and therefore such mines offer no obstruction to friendly traffic, though anchoring in the mine field must be prohibited for fear of damaging the cables. As the mines are not in contact with the ship at the moment of firing and as errors in observation must be allowed for, these mines must carry larger charges of explosive than mines fired by contact with a ship and they are usually fired in groups.

In the *circuit closer* system, each mine contains an apparatus which is actuated by any vessel or other heavy object bumping against the mine. When set in action the apparatus completes the electrical circuit through the detonators in the explosive charge and the mine fires if the main controlling switch on shore is closed. When it is not desired to fire, the main switch on shore is kept open and the circuit closer is restored to its open condition automatically after the mine has been bumped. Such mines are necessarily placed near the surface and though they can be rendered harmless they are liable to damage by vessels passing through the field and consequently are used in waters which it is intended to close entirely. Their principal advantage over observation mines is that as long as the main switch is closed they are effective in fog or mist, when observation mines and the guns of the defence system could not be effective. As they are fired in contact with the ship a comparatively small charge only is required and only a single mine is fired at a time.

Non-controlled Mines.—In these the means of firing are contained in the mine itself; they may be fired either electrically by means of a small local battery or mechanically by a spring, pistol or suspended weight. In all cases the impulse which actuates the firing gear is the bump given by a ship or other heavy object striking the mine. When non-controlled mines have once been laid they are dangerous to friend and foe alike. Safety arrangements are fitted to these mines to keep the firing apparatus out of action while the mine is being laid, to render the mine harmless in case it breaks away from its mooring and, in some cases, to render it inactive after a certain period of time. Mines that fail in these respects become as great a danger to friend as to foe. At the outbreak of war in 1914 the German Carbonit mine was unreliable in respect to its safety after breaking adrift while the British mines were, unfortunately, only fully efficient in the same respect. In the latter part of 1917 the new and improved British H2 mines came into use. This mine was similar in principle to the German Carbonit mine except for the method of taking up the predetermined depth.

The German method of depth-taking was for the mine, attached to the sinker, to drop to the sea bottom, where, after a short interval for the purpose of safety, the mine released itself from the sinker and rose to the depth for which it was set. In the British method, on release from the minelayer the mine remained on the surface while the sinker went down, unreeling the mooring wire until a small weight (hanging below the sinker a distance equal to the depth the mine was required to be below the surface) struck the bottom. The mooring rope then stopped unreeling and the sinker continuing to sink pulled the mine below the surface. An advantage of the British system was that heavy water pressure on the mine-case was obviated; but, on the other hand, it did not obtain the exceptional accuracy in depth-taking which was noticeable in the German method. The United States used a mine of a novel type. It carried the usual charge of 300lb. of tri-nitrotoluene, but from each mine there extended antennae for a distance of 35ft. which, if touched by a metal ship, exploded the mine. The result was that the danger zone was largely increased.

Moored mines can be laid in any depth up to 100 fathoms, or even more in tideless waters, and they can be regulated to lie at any depth below the surface. Deep mines are used against submerged submarines, and shallow ones against surface shipping. In a strong tide, with a long mooring-rope, the mine will bend over to the tide; so that mines, under strong tidal conditions, sometimes lie too deep to be harmful to surface ships. During the War in a position such as the Pentland Firth, mines were in fact

only a danger at slack water, a period of minutes only. Again, the difference in height between high and low water is an important matter. If, for instance, the tidal range was exceptionally large, as in the Bristol Channel or Bay of Fundy, all types of ships could pass over a minefield at high water in perfect safety, provided no mines had been seen at low water on the surface. By The Hague convention drifting mines should become inactive one hour after they are first dangerous. Some uses for these mines are (a) for attacking ships sheltering in a harbour by allowing the tide to drift the mines in; (b) for dropping in the wake of a ship or squadron when being chased.

The most recent forms of drifting mine are oscillating mines which maintain themselves at approximately a steady depth by mechanical means. The inventors claim for them the advantage that they cannot be swept up. Of oscillating mines a well known type is the Leon mine. The mine is slightly heavier than the water it displaces and therefore sinks slowly. On passing the prearranged depth a hydrostatic valve switches on electrical power which drives a propeller and causes the mine to rise until at a certain depth the power is switched off, and the mine commences to sink again.

MINELAYING

Mines are laid by vessels specially fitted to carry them. In surface vessels the mines rest on their sinkers which have wheels at the bottom running on rails laid on the decks in a fore and aft direction. Means are provided for hauling the mines along these rails until they enter the mine traps placed in ports cut in the stern of the ship. The traps hold the mine in position ready for letting go. When the trap is opened the mine sinker runs down a short curved piece of the rails and drops into the water. In minelaying submarines the mines are carried in tubes or shoots formed in the hull, from which they can be released one at a time.

British Minelaying Resources.—At the outbreak of hostilities in 1914 the British Navy possessed seven old cruisers (Latona class) fitted as minelayers. These had a speed of only 14 knots. Shortly afterwards four merchant ships were added; and in the second part of the War a considerable number of submarine minelayers and fast destroyers were used.

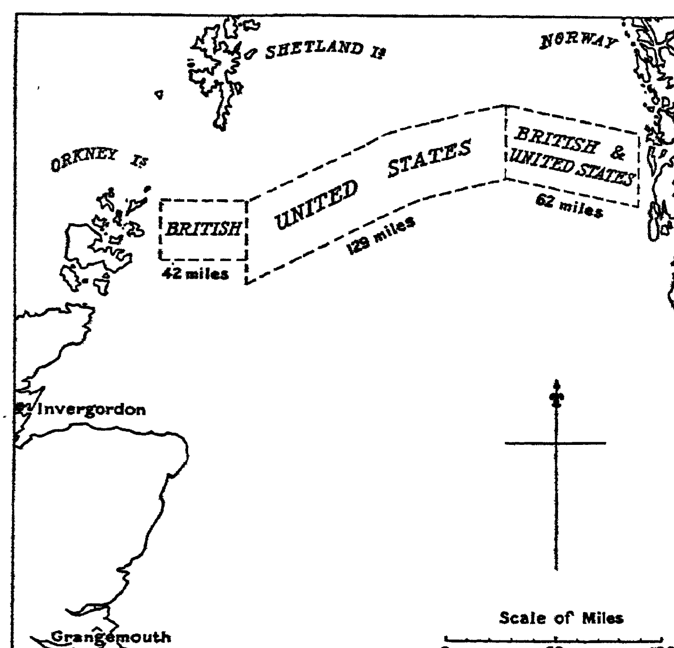
German Minelaying Resources.—At the outbreak of war the Germans had available 3 men-of-war and nine auxiliary vessels fitted as minelayers. Two of the men-of-war "Nautilus" and "Albatross," were 20 knot vessels and each carried 200 mines. During the War four more auxiliaries were fitted including the raiders "Möwe" and "Wolf." In 1915 the first of the submarine minelayers started work. In June 1915 a small type, termed U.C. boats, working from Zeebrugge, with Bruges as a mine-depot, commenced laying batches of 12 mines held in vertical shoots, at first between Dover and Harwich, and later over a wider area. During 1915, 54 cargoes (648 mines) were laid in this manner. The effect was a serious increase in British losses by mine, which comprised 5 supply ships, 1 hospital ship, 2 Trinity House vessels, 34 steamers, 19 fishing boats and 15 minesweepers, also 24 neutrals, a total of 100 vessels. The number of German submarine minelayers increased in 1916, and there were larger boats operating over a still wider area. These carried 18 mines. As further construction improved, the number of mines carried rose to 24, and in 1917, to 36. The larger boats worked from the Elbe, and the smaller from Flanders.

Elements of Mining Warfare.—Three factors are necessary for successful mining warfare—the strategic function, the operation of laying the mines and the technical efficiency of the mine itself. The first of these factors is woven into the main strategy of a naval war. The stronger fleet, in its anxiety to seek out and destroy its enemy, desires a clear sea; and, to obtain this, must insure that such a means of attrition as the mine is reduced to the utmost. On the other hand, the weaker fleet will use the mine profusely in an endeavour, by attrition, to reach an equality or superiority of force: and it will also use this weapon against merchant ships, particularly when they belong to a belligerent dependent on its carriage of foodstuff from overseas. This was the initial stage of naval strategy in the World War; and to some extent it explains the pre-war application of the Germans to mining and the comparative neglect of the subject by Great Britain. The second factor is the operation of laying the mines. To be successful, this must be governed by the element of surprise, and be expeditiously performed; it requires for its purpose a ship of high speed, or one which, by disguise or subterfuge, can carry out the work unmolested.

The third factor is purely one of technique. No type of mine that does not meet the following requirements is efficient. It must be safe until it is laid. When laid, it must take up and maintain its required depth, throughout all kinds of weather, for an appreciable length of time. It must be immune from mechanical failure when required to function. In the interest of both belligerents and neutrals, it must automatically render itself safe should it break from its moorings. Considerable importance attaches to the design of a minefield. A simple straight line of mines is easily and quickly laid, but presents little difficulty to the minesweepers once it is located. Lines of mines laid in zig-zags, particularly when spaces of water are left clear, present the greatest difficulty to removal. On the other hand, such patterns will necessarily cover a larger sheet of water, and will require very accurate plotting if, subsequently, the vicinity of the mined area is to be approached by the sea forces of the minelayer. An existing apparatus termed "taut wire measuring gear" proved a great aid to accuracy in positioning a minefield.

British Minelaying in the War.—On October 2, 1914, the first line of 1,264 mines was laid by the old cruisers in an area 10m. north of Ostend. This had the effect of forcing neutral shipping to pass through the Downs. Unfortunately, the British mines then in use proved so defective that for a time minelaying had to cease; and although in 1915, after some technical improvement, some 15 more minefields were laid, it was not until 1916 that attention was concentrated on providing a mine of the calibre of that used by the Germans.

One of the principal British minelaying operations of 1916 was a coast barrage, consisting of a double line of deep mines, running



THE PLAN OF THE GREAT NORTHERN MINE BARRAGE OF 71,126 MINES LAID IN 1918, BY BRITISH AND UNITED STATES MINELAYERS

for 40m. from the Belgian coast, at a distance of 12m. from the shore. It was supplemented by mine nets laid by the Dover drifters. The work took five weeks to complete; but only one submarine seems to have been accounted for by it. The end of the year saw the institution of a mining school at Portsmouth for research and development.

On the assumption that the Belgian coast barrage had been effective, a similar barrage was completed in Feb. 1917 across the Straits of Dover; but the mines dragged and had to be swept up.

It was, however, relaid by the end of July 1917. In Jan. 1917 it became essential to encircle the Heligoland Bight and thus to surround all exits from German ports; but the shortage of mines at the time caused the operation to be postponed, nor was the British mine considered suitable for it. However, towards the end of 1917 the "Abdiel" and five minelaying submarines had laid nearly 16,000 mines in the German Bight; and these accounted for a certain number of German destroyers and minesweepers. The mine used in the later stages of this operation was the new British H2. In due course the new H2 mine was delivered in sufficient quantity for the long-delayed defensive minefields to be begun by the British, and an extensive new barrage in the English Channel was then completed. Between Folkestone and Cape Gris Nez 9,500 mines were laid in 20 parallel lines, the shoals of the Varne and the Ridge dividing the area into three sections. This barrage effectively closed the Channel exit to the German submarines, nine of which were lost in attempts to pass it.

Minelaying by the United States.—The entry of the United States into the War admitted of a large augmentation in mines and in minelayers; and an attempt was made to close the northern exit from the North sea by a mine barrage between the Orkneys and the Norwegian coast (*see* plan). This operation was undertaken by both British and U.S. minelayers. The latter formed a base at Inverness, and supplied ten large minelayers with a total carrying capacity of over 5,500 mines.

The vast area covered by mines can best be appreciated by a reference to the plan, which gives an idea of the work carried out by the U.S. minelayers. Difficulties were encountered as the operation proceeded. A proportion of the American mines exploded prematurely; while a number of British mines took up a shallower depth than intended, and had to be swept up and relaid. The complete operation, however, was finished by June 1918. It must not be supposed that the whole water available for a submarine was effectively covered by this minefield; but the dangerous area was greatly increased and an effect on the *morale* of the Germans quickly produced. In July German submarines began to creep past in Norwegian waters; but the Norwegians closed this coastal lane to both belligerents by minefields of their own. Of the mines laid in the Northern Barrage 56,033 were American and 15,093 British. All the time the encircling of the Bight had been going steadily on, and some 21,000 mines were in place by the date of the Armistice. During the period of the War, approximately 172,000 mines were dropped in the North sea and Channel by the British and American minelayers, the very great majority of which were laid during the last 18 months of the War. The Italian Navy laid 12,293 mines during the War chiefly in the Adriatic.

German Practice.—In the early part of the War, the Germans used surface vessels for minelaying and the fields consisted of large groups of mines concentrated in areas where they were likely to damage naval vessels. For instance, on Aug. 5, 1914, the "Königin Louise" laid a line of about 150 mines off the east coast of England and on Dec. 16, 1914, under cover of the raid on Scarborough the "Kolberg" laid 180 mines near Scarborough Bay. After 1915 German minelaying in British home waters was carried out almost entirely by submarines. These usually confined their mines within an area of two or three sq. miles, laying them in groups of four or even less. The position chosen was most frequently near some focal point, buoy or lightship, or at the entrance to a naval base or commercial port. For instance, during the war, over 450 mines were laid by German submarines within a mile of the Shipwash Light vessel, a position necessarily passed by all traffic up and down the east coast war channel, by the convoys to and from Holland and by those destroyer flotillas based on Harwich. The Germans also allotted to each of these submarines a particular stretch of the British coast. The flotillas working from Flanders covered the coast from Flamborough Head south about to the Clyde, also the northern French coast; the high sea, or large boats, working from the Elbe, were responsible for the rest of the English and Scotch coasts, and the whole of Ireland. Each commander being restricted to work in his individual area, the danger of striking previously laid mines was minimised. The commanders, moreover, by this arrangement, got quickly into touch with the local movements of the traffic, the method and capacity of their opposing minesweepers and the coastal navigation within their beats. In most cases after some 10 to 14 days a commander would not hesitate to pass over a position where he had previously laid mines. He would be confident that his mines had been discovered and cleared if shipping had been seen in the area. Minelaying from surface vessels was confined to disguised raiders such as "Wolf" who laid small groups of mines in various parts of the world including the Cape, Bombay, Colombo and Australian coasts. Altogether 11,000 mines were laid by German minelayers in British home waters.

The first mining offensive against the Grand Fleet occurred in August 1915, when 380 mines were laid in the entrance to the Moray Firth, distributed over lines which totalled nearly 70 miles. A large portion of the fleet was at Invergordon at the time. The results were negligible, the losses being confined to minesweepers and one destroyer. A channel was found to be clear on the northern side of the Firth, which was at once used as an exit for the fleet. On the southern side, however, a channel was cleared, but an area of mines was purposely left to form a defensive barrier and so limit the water requiring patrol and minesweeping. On January 1, 1916 the area west of Scapa Flow was mined by the "Möwe" on her passage into the Atlantic. In this field 252 mines were laid, endangering an area of 40 sq.m., which resulted in the loss of H.M.S. "King Edward VII." before the presence of mines was realised. Once located, this area was treated in the same way as the Moray Firth.

On May 29, 1916, "U.75" laid her 18 mines close to Marwick Head, off the northwest coast of Orkney. The operation was part of the pre-Jutland submarine actions of the enemy. It is probable that these mines were intended to be laid off the western entrance of Scapa Flow to hinder the exit of the fleet and that a mistake was made in the position. The mines were set for a depth of seven metres. The tide was appreciable causing sufficient "dip" to insure that the mines at this depth should be innocuous even to a heavy-draught ship, except at low water, and with considerable motion on that ship. The period of slack water was extremely limited. The "Hampshire," proceeding in a sudden gale, and hugging the shore to obtain less sea, struck one of the mines at low slack water and sank. By this curious conjunction of all these factors, the career of Lord Kitchener was brought to a tragic close. Except for a determined offensive by the Flanders submarines against the Channel Ports, the mine was not extensively used in the latter part of 1916. It would appear that the Germans were then husbanding their resources for unrestricted submarine and mine warfare.

Synchronous mining of adjacent British ports was resorted to by the Germans, which raised many sudden problems in traffic control. The convoy system had now been introduced, and the sweeping of convoys into certain ports often became essential. Particular difficulties arose in regard to Liverpool owing to the shallowness of the channel and narrow entrance; mines swept up, and sunk without exploding, causing serious danger to heavy draught ships by their proximity to the ship when resting on the bottom. The south coast of Ireland was seriously and continuously mined, and even the bays on the west coast of Ireland did not escape.

Early in 1918, an appreciation of failure led the Germans to concentrate their efforts in minelaying in two directions only. The first was a grandiose scheme, which, commencing in January, was only concluded in late September. It consisted of batches of 36 mines, laid at regular intervals of 10m. apart on a semicircle 45m. from the Bell Rock, the result being a complete ring round the entrance to the Firth of Forth. This operation fulfilled a two-fold purpose. It menaced the exit and entry of Norwegian convoys, which were then working from Methil in the Firth of Forth; it also menaced every possible course taken by the Grand Fleet when leaving or entering its base at Rosyth. The scheme, however, was barren of results to the Germans, although methodically carried out in every detail. It was appreciated and countered after the third batch of these mines was discovered, the result being that each of the successive groups of mines was located and cleared immediately; and this was done without the Germans

realising that any of these groups had been removed. The other concentration took the form of a field of 400 mines, also laid gradually by submarines. It was directed against the Dutch convoys, and was laid close to the Dutch coast to cover the approaches to the Maas and Ijmuiden. This position was such that any attempts at clearance exposed the minesweepers to a flank attack from enemy vessels. There were some losses by mine, particularly to destroyers escorting the convoys; but the convoys sailed as before, and the losses, on the whole, were very trivial. The total number of German mines laid in all parts of the world was 43,636.

MINESWEEPING

Methods of Sweeping.—At the outbreak of War, the British system of minesweeping was for two vessels to tow a stout wire between them, the wire being kept at the required depth by means of water kites, one being attached to each side and towed astern of each vessel.

The sweep comes into contact with the mooring rope of the mine which is generally cut in the process of dragging particularly when serrated wire is used. When the mooring rope is cut the mine comes to the surface when it can be sunk by rifle-fire. In some cases, however, the sweep strikes a horn of the mine, and explodes it. This occasionally parts the sweep and consequent delay is caused while a new wire is passed. The most serious drawback is that if the sweep fails to break the mine wire, the mine is towed along, more often than not unknown to the sweepers. This latter trouble caused many of the early minefields in the War to be scattered far beyond the limits in which they were laid, and constituted a serious danger. The eventual safeguard was to heave the sweep slowly in, and to sight the whole wire and water-kites on the surface before slipping it, when a mine holding to the wire would be seen and reswept afterwards. The innovation of a serrated form of sweep wire eventually reduced the difficulty to a considerable extent. This simple method of minesweeping stood the test of the whole war, and its simplicity had the great advantage of reducing the training period which would have been necessary had a more complicated apparatus been used. Sweeping with this type of sweep can be carried out by any suitable pair of vessels. Trawlers and drifters are fitted with appliances for their ordinary fishing work which make them readily convertible into sweepers. They are also very good sea boats and as far as weather conditions are concerned, sweeping can be carried out by them as long as they can come together to pass the end of the sweep wire from one to the other. Where, however, mines have been laid at very shallow depths and there is little or no rise and fall of tide lighter draught vessels must be used as sweepers. When sweeping, marks are laid out to show the channel which has been cleared. That minesweeping is a most arduous and dangerous work is shown by the fact that throughout the World War an average of half of the crew of a trawler was lost when one was mined. For the first two months of the war, for every two mines swept up one trawler was lost. Improved methods and greater experience later minimised the losses, until an average of one loss for every 80 mines was achieved in 1918.

The French towed from a single vessel two sweeps, one on either side, each kept out by an otter similar to the usual otter used in trawling but regulated for depth by attachment to a large torpedo-shaped float, the depth at the other end being regulated by a water-kite. Along each wire was distributed a series of small mechanical and explosive wire-cutters. The "shooting" of these sweeps caused trouble unless the crews were adept, and the speed at which the apparatus could be towed was limited to six to seven knots. The spread of the British system was 400 to 500 yd. per pair according to the type of minesweeper, that of the French system not more than 200 yards. In the latter part of the war the Americans adopted the French method, which had by then been somewhat simplified.

The German system was akin to the British, excepting that, in order to cover the route of their fleet more quickly, they instituted a very light form of sweep which could be towed at 20 knots. Directly this apparatus met with an obstacle it was automatically slipped, thus giving notice of the obstruction, whereupon the slower type of sweepers were hastened to the spot to clear it. In practice this system constantly led the fast sweepers to report mines when they had only encountered wrecks or some other harmless obstruction, and little confidence was therefore placed in the reports of mines by this fast flotilla. Under ordinary cruising conditions, searches by sweepers were made whereby only a small percentage of the water was covered—sufficient, however, to allow a strong probability of the presence of mines being discovered in good time. The introduction of the "paravane," which protected the ship herself, very much reduced the mine danger; but it is an apparatus which, for assured efficiency, requires skilled handling. There are situations where its use is impracticable, and it has not replaced the necessity for the minesweeper.

Minesweeping During the War.—Before the outbreak of war in 1914 the British navy had, to some extent, realized the possibility of a mining offensive on the part of their enemies; and, largely due to the foresight of the late Admirals Lord Charles Beresford and Sir Doveton Sturdee, trawlers had been tested and had proved to be efficient minesweepers as early as 1907. A trawler reserve purely for minesweeping was instituted shortly afterwards. Thus, by August 8, 1914, 96 hired trawlers had put to sea to sweep up enemy mines, and within a fortnight another 100 trawlers had been requisitioned and were fitting out. The trawler minesweeper, however, did not entirely cover the requirements, as it was too slow to sweep the water ahead of a moving fleet; and this had been realised, and to some slight extent, catered for, by training a flotilla of eight old torpedo-gunboats. These ships were capable of towing the sweep at 12 knots, which was double the speed at which the majority of the trawlers could operate. This gunboat flotilla moved north from Dover on July 31, 1914, and, with sweeps out, actually covered the track over which the Grand Fleet passed. They were necessarily much overworked in the first six months of the war, as, whenever practicable, they swept the waters through which the fleet moved, and were also constantly required to search areas where mines were expected to be laid. The first batch of the special sweeping vessels, called sloops, was laid down in January 1915.

In British home waters the augmentation of the minesweeping force was less difficult than abroad. Light-draft excursion vessels (paddlers) were requisitioned in addition to the newly built craft already mentioned, and by April 1915, over 150 vessels were employed on minesweeping in home waters. In the Dardanelles 8 cross-channel steamers had augmented the trawler force, and a certain number of destroyers had been fitted for minesweeping.

Progress in 1916.—By the beginning of 1916, 14 sloops had joined the Grand Fleet, and 35 hired paddlers were in action. The success of this latter type led to 24 being laid down by the Admiralty, and also a new type of twin-screw sweeper, known as the "Hunt" class. The value of these ships lay in their sea-keeping qualities and shallow draught. The paravane (*q.v.*) also passed its test in 1916, and by the end of the year had been supplied to 180 of H.M. ships. A modified form of this apparatus was fitted in merchant vessels; and, by the end of the war, 2,740 merchant ships had been fitted.

The intensity of minelaying and expansion of areas in the first half of 1917 was difficult to meet with the minesweepers available; and the climax was reached in April, with a loss of one minesweeper per diem for the greater part of that month. Probably no other service had a more severe strain placed on its personnel during this month and those immediately following. Every available and suitable paddle steamer and motor fishing boat had to be requisitioned; and those incapable of towing a heavy sweep were fitted with a light one, and used for search. Aircraft and motor launches were also used for low-water searches for mines, in order to reduce losses of sweepers; and improvements in traffic organisation and still closer co-operation between adjacent areas were gradually effected. Further protective minefields were laid in certain suitable positions, but the opening of new areas was constantly necessary; and, by the end of 1917, the coastal waters of Great Britain and Ireland, over 1,000m. in extent, were being swept every day for mines. The war channel was also extended to the Firth of Forth, and merchant ships only released from a night

shelter when they could proceed in freshly swept water. One hundred new vessels of the "Hunt" class were laid down, and 300 new drifters put out to contract, so as gradually to replace and release trawlers for patrol and anti-submarine work.

The year closed with a total of 3,989 German moored mines swept up in home waters, at a cost of 170 Allied and neutral merchant ships sunk and 28 damaged. This total of mines for the year exceeded the combined totals for the previous years of the War. Nevertheless, the outlook was more hopeful. Although the intensity of minelaying had become so much greater, the losses had only been increased by nine ships over those of the previous year; and progressive success in the destruction of submarines and their personnel made it evident that the same intensity and efficiency of the minelayers could not be continued much longer. New construction and greatly improved material for minesweeping had already made their mark. The only fear was that the minesweep would be defeated by some innovation of the enemy. This fear, however, never materialised; although a delayed action (whether intentional or otherwise) for releasing the mine from its sinker some hours after it was laid was observed on several occasions.

Minesweeping After the Armistice.—When the hour of the Armistice struck, a minesweeping force was waiting at the gate of the Dardanelles; and, within 24 hours, 600 British and enemy mines had been removed to clear the way for the fleet to Constantinople. For one year after the War, mineclearing was continuous in every area where British or German mines had been laid. Under the difficult conditions which immediately followed the war, a special minesweeping force had to be enrolled. It consisted of some 600 officers and 15,000 men. Over 23,000 Allied mines and some 70 German mines were cleared from the sea by British minesweepers. No loss of a merchant ship by mine occurred during that period; and exactly one year to the day from the institution of this force the seas round Britain, her colonies and in the Mediterranean were reported clear. A fine performance in this respect was the clearing by the Americans of the mines laid between Orkney and the Norwegian coast. The Germans also commenced to clear the heavily mined areas in the Heligoland Bight, and later in the Baltic; but this work of clearance was not completed until 1923. Other nations concerned cleared their own coastal waters. (For military mines *see* FORTIFICATION and SIEGECRAFT.) (A. H. W.)

MINGHETTI, MARCO (1818–1886), Italian economist and statesman, was born at Bologna on Nov. 18, 1818. In 1846 he was appointed member of the State council summoned to prepare the constitution for the papal States. In the first constitutional cabinet, presided over by Cardinal Antonelli, Minghetti was minister of public works, but after the allocution by Pius IX. against the Italian war of independence he resigned, and joined the Piedmontese army as captain on the general staff. Returning to Rome in Sept. 1848, he refused to form a cabinet after the assassination of Pellegrino Rossi, and spent the next eight years in study and travel. He was in 1859 appointed by Cavour secretary-general of the Piedmontese Foreign Office. In the same year he was elected president of the assembly of the Romagna, after the rejection of pontifical rule by those provinces, and prepared their annexation to Piedmont.

Appointed Piedmontese minister of the interior, he resigned office shortly after Cavour's death, but was later made minister of finance by Farini, whom he succeeded as premier in 1863. With the help of Visconti-Venosta he concluded (Sept. 15, 1864) the "September Convention" with France, whereby Napoleon agreed to evacuate Rome, and Italy to transfer her capital from Turin to Florence. Minghetti was then driven from office. He took little part in public life until 1869, when he became minister of agriculture in the Menabrea Cabinet. Both in and out of office he exercised his influence against an Italo-French alliance and for an immediate advance upon Rome, and in 1870 was sent to London and Vienna by the Lanza-Sella Cabinet to organize a league of neutral powers. In 1873 he overthrew the Lanza-Sella Cabinet and was premier and minister of finance until the fall of the Right on March 18, 1876. During his premiership he inaugurated the *rapprochement* between Italy, Austria and Germany; and, as finance minister, restored equilibrium between expenditure and revenue for the first time since 1860. After the advent of the Left, Minghetti remained for some years in Opposition, but towards 1884 joined Depretis in creating the "Trasformismo," which consisted in bringing Conservative support to Liberal cabinets. Minghetti died at Rome on Dec. 10, 1886. His writings include: *Della economia pubblica e delle sue attinenze con la morale e col diritto* (Bologna, 1859), and *La Chiesa e lo Stato* (Milan, 1878).

MINIATURE PAINTING. The word "miniature" is derived from the Latin "minium," vermillion, the colour used for the borders of the pages and the initial letters of manuscripts, in which small pictorial scenes were introduced. These lines were later on known as rubrications, and the word "miniature" applied to the decorations themselves, rather than to the lines which surrounded them. Then, owing to the small size of the work, the word became connected with the French word "mignature" and so gradually applied to paintings in little, and in the present day to anything that is of unusually small size. The two more accurate phrases are "paintings in little" as Pepys calls them, or "limnings" as they were termed in 1675, and the miniature painter, even in Queen Anne and George I.'s time, was spoken of as the "limner." That word itself goes back to "enluminer," and that again is derived from the Latin "illuminare," to paint. (For Byzantine and Early Christian miniatures *see* ILLUMINATED MANUSCRIPTS.)

(G. C. W.)

MINIATURE PAINTING IN THE EAST

The beginnings of miniature painting in the Mohammedan East are obscure, in consequence of the various forces of destruction that have laid in ruins so many of the centres of Muslim culture, as well as the hostile attitude of the theologians towards all forms of representational art, and the fanaticism that sought to destroy the work of the artist. Two or three drawings on Arabic papyri of the 10th century, now in the collection of the archduke Rainer in Vienna, show that Coptic influence was operative from an early period in the Mohammedan era; but examples are not forthcoming as evidence of any further development in Egypt.

Persia.—In Mesopotamia, however, in the 13th century begins a series of miniature paintings, illustrating the Maqāmāt of Ḥarīrī and such animal stories as those of Kalīla and Dimna; a comparison with contemporary miniatures in the service books of the Jacobite and Nestorian Churches suggests that the painters were either themselves Christians or were carrying on the tradition of oriental Christian art, in the service of Muslim employers. Influences of another kind are observable in the illustrations of a ms. (dated A.H. 710=A.D. 1310–11) of the history of the world, by the famous minister of State, Rashīd ud-Dīn (d. A.D. 1318), made by his painters in Tabriz; the talented author appears to have provided not only Christian but also Chinese and Indian pictures for the guidance of his painters in their representations of the various historical incidents of successive ages. From this period onwards Persia continued to produce the finest examples of Mohammedan painting. Chinese influences were, it is true, prominent under the rule of the Mongol conquerors, and portraits of them occur (*e.g.*, in such a ms. as *Supplément persan* 1113 in the Bibliothèque Nationale); but native Persian genius began to re-assert itself in the reign of Tīmūr (1369–1404) and under his immediate successors, and freed itself from all such Chinese influences, except certain conventional forms of representation, such as clouds, etc. Several portraits of Tīmūr are extant, and his sons and grandsons, who divided his empire among themselves, were distinguished for an even more generous patronage of artists. But the art of painting in Persia is entirely anonymous until the reign of the last of the Timurid princes, Sultan

MINIATURES OF THE 17TH TO THE 19TH CENTURY

1. Portrait of Sir Kenelm Digby (1603–65), signed and dated 1627, by Peter Oliver (1594–1647), English. From the collection of the Hon. Frederic Wallop
2. Portrait of Charles, fifth Lord North, first Lord Grey of Rolleston, painted *c.* 1650–65, by Samuel Cooper (1609–72), English. From the collection of the Hon. Frederic Wallop
3. Portrait of Voltaire, by Louis Cheron (1655–1735), French. From the Pierpont Morgan collection, New York
4. Portrait of Madame du Barry, by Richard Cosway (1742–1821), English. From the Pierpont Morgan collection, New York
5. Portrait on ivory of the Hon. Frances Courtenay, by Andrew Plimer (1763–1837), English
6. Portrait of the artist in fancy costume, by Nicholas Lancret (1690–1743), French. From the Pierpont Morgan collection
7. Portrait on ivory of Lord Robert Fitzgerald, by George Engleheart (1750–1829), English
8. Portrait on a snuff-box, of the children of Mme. de Coincy, by Jean Baptiste Jacques Augustin (1759–1832), French. From the Pierpont Morgan collection, New York
9. Portrait of Marie Antoinette, Queen of France (1755–93), by Antoine Sergent (1751–1817), French. From the Pierpont Morgan collection
10. Portrait of the artist, by Peter Adolf Hall (Pierre Adolphe) (1739–93), Swedish. From the collection of His Majesty the King of Sweden
11. Portrait of Mlle. Constance Mayer, by Pierre Paul Prud'hon (1758–1823), French. From the Pierpont Morgan collection, New York
12. The artist's daughter, by Jean Baptiste Greuze (1725–1805), French. From the Pierpont Morgan collection, New York
13. Portrait of Mlle. de Bethisy, daughter of the *dame du palais* to Marie-Leszczynska, queen consort of Louis XV. of France, by François Dumont, the elder (1751–1831), French. From the Pierpont Morgan collection, New York
14. Portrait of Mrs. Baldwin, signed and dated 1782, by John Smart (1741–1811), English. From a private collection in London
15. Portrait of the Marquise de Gauville, by Nicolas de Largillière (1656–1746), French. From the Pierpont Morgan collection, New York
16. Portrait of Mrs. James Lowndes, by Edward Green Malbone (1777–1807), American
17. Portrait on ivory of Alexander Murray, by James Peale (1749–1831), American
18. Portrait of Queen Charlotte (1744–1818), wife of George III., by Ozias Humphry (1742–1810), English. From the collection of His Majesty the King of England
19. Portrait on ivory of George Washington, by Robert Field (1749–1819), English
20. Portrait of Mrs. Stephen van Rensselaer third, water colour on ivory, by Robert Fulton (1765–1815), American

Ḥusayn Mīrzā, who reigned in Harat from 1468 to 1505. The most famous painter in the annals of Persian art, Bihzād, during the earlier part of his career worked under the patronage of this prince, and more than one portrait of his patron is attributed to him. Later, Bihzād enjoyed the favour of Shāh Ismā'īl, the founder of the Safavid dynasty in 1502, and for about a century a succession of painters of extraordinary talent were actively employed in the service of the earlier monarchs of this dynasty. Their work has survived mainly in manuscripts of Persian poetry, which they were called upon to illustrate, and masters, such as Mīrak, Muẓaffar 'Alī, Qāsim 'Alī and Sultan Muḥammad, carried on in a brilliant manner the traditions of the school of Bihzād. Shāh 'Abbās (1587–1629) followed the practice of his forefathers in employing a number of court-painters, who worked in the royal atelier, but though their names have been recorded, it is difficult to assign to them, with any degree of certainty, the pictures that have survived from this period. Only a very few paintings bear the signature of any of these court-painters, with the important exception of Rizā 'Abbāsī, who was a prolific artist, and not only had the habit of signing his pictures, but in many instances also wrote out long inscriptions giving the exact date and the circumstances under which the pictures were made; he was a master in the art of portraiture, and his miniatures have preserved a record of Shāh 'Abbās, his patron, and of a considerable number of his contemporaries. A portrait of the master himself, who died in April 1635, is extant, copied 40 years later by an enthusiastic admirer, named Mu'īn Muṣavvir, who called himself his pupil.

India.—From the end of the 16th century onwards, portraiture constituted one of the most prominent forms of artistic activity not only in Persia, but also in India. The emperor Akbar (1542–1605) kept up a large establishment of over 100 painters, and employed them to illustrate his manuscripts, especially the translations which he had made for his use of works of Sanskrit literature into Persian. The emperor himself often sat for his portrait, and also ordered the portraits of the grandees of his court to be taken. Of the painters themselves very little more than their names is known, but these frequently occur, written apparently by some one of Akbar's clerical staff, not by the artists themselves, under the paintings with which they were credited. Among them, 'Abdus Samad was especially noted for his skill in portraiture and he was entrusted with the training of some of the other court-painters. Jahāngīr (1605–1628) was as generous a patron of painters as his father had been, and innumerable portraits of him and of his courtiers are in existence; in his memoirs, the emperor makes mention of several of these artists, and bestows especial praise on Abu'l Ḥasan, as having painted a picture of his accession, and on Bishandās, as a painter of portraits; the latter was sent to Persia in the suite of an ambassador accredited to that court, in order that he might there paint the portraits of the shāh and the chief nobles. Shāh Jahān (1628–1659) carried on the tradition of his father and grandfather in patronizing art. The head of his staff of painters was named Muḥammad Faqīrullāh Khān, and he was assisted by Mīr Hāshim, famous as a portrait painter. But the rigid orthodoxy of his son, Aurangzeb (1659–1707), caused him to be hostile to all forms of representational art, and during the long reign of this monarch the art of painting in India suffered a decline from which it never entirely recovered, and though many pictures, portraits especially, were produced, they fall short of the fine achievements of the court painters of the first five emperors of the Mughal dynasty.

Turkey.—Similarly, orthodox sentiment stood in the way of painting receiving so open and generous a patronage in Turkey, as it had once enjoyed in India, though some of the Ottoman sultans took painters into their service; the earliest of these were Persians, and it was not until the middle of the 15th century that there is any record of a painter of genuine Turkish stock, named Ḥusāmzāda Ṣan'ullāh. Mohammed II. (1451–1481) took a special interest in the work of Italian painters and medallists, and Gentile Bellini worked for him in Constantinople for a little more than a year, and trained a Turkish pupil, named Shiblīzāda Ahmad. Sulaymān the Magnificent (1520–1566) also encouraged painters, one of whom, named Ḥaydar, made copies of miniatures by François Clouet; but lack of intelligent patronage checked the growth of a school of painters in Turkey, and their achievement has consequently been more meagre and less distinguished than that of Mohammedan painters in either Persia or India.

EUROPEAN MINIATURE PAINTING

Portraits of living persons appear in illuminated manuscripts, especially of the 14th, 15th and 16th centuries and in many notable documents. They reached a high standard in France and the Netherlands. Hans Holbein the younger executed small portraits of very fine and dainty technique, such as are called in the present day miniatures; and though at this period there were other portrait painters who were responsible for somewhat similar work, such as Shute, Betts, Benninck and Teerlinc in England (*see* Salting collection, Victoria and Albert museum) Holbein is generally regarded as the earliest and greatest representative of the art. The technique of the European miniature painter was closely derived from that of the painter of illuminated manuscripts.

England.—The earliest known English miniature painter, Nicholas Hilliard (*c.* 1547–1619), in his work shows clear signs of such derivation, his colours are opaque, gold is used to heighten the effect, but the portraits have a flatness and absence of shadows entirely resembling the paintings of the illuminated manuscripts. His son's work is a little bolder than that of the father, and his miniatures somewhat richer in colour. Two painters named Isaac and Peter Oliver, father and son, succeeded Hilliard, Isaac (*c.* 1567–1617) being stated to have been a pupil of Hilliard, and Peter (1594–1647) his father's pupil. These two men were the earliest to give roundness and form to the faces that they painted, and they were responsible for larger portraits than Holbein or Hilliard had ever painted in miniature, some of them measuring as much as 10 in. by 9 inches.

The representations of all these four miniature painters are flat, everything is seen in one light, all in detail, and embroidery, lace or jewellery presented with almost microscopic minuteness.

The two Olivers were followed by two painters named Hoskins, again father and son, the elder, John (d. 1664) was the master of Samuel Cooper the greatest of English miniaturists. In the time of Hoskins, the influence of the old school of illuminators nearly passed away, the portrait was presented much more completely in the round, in distinguished fashion, painted with a full brush in easy rich masses, and the harmony of colours was deeper and grander. Hoskins was the first of the miniature painters to be able to represent in satisfactory fashion the appearance of flesh.

Hoskins was succeeded by Samuel Cooper, his nephew (1609–1672), who spent much of his early life in France and Holland, and whose work in miniature has been characterized as "life-size in little." His under-painting is often in sepia, but where flesh was concerned in vivid green with a transparent red lake over it. He painted faces supremely well, although erring a little on the ruddy side, and Walpole says of him that, "if a glass could expand Cooper's pictures to the size of Vandyck's, they would appear to have been painted for that proportion."

Up to this time, miniature portraits had been painted mainly upon the backs of playing cards, very occasionally upon thin skin, usually chicken-skin, stretched across such card, but Cooper experimented twice at least upon mutton bone. The use of ivory did not come in until long after his time. His portraits mark the supreme point in English miniature portrait painting.

He had a brother Alexander (d. 1660), whose works resemble those of Samuel Cooper, but are not as strong or as magnificent.

There were many other painters of his period; among them were David des Granges (1611–1675), whose work can be studied at Ham House and Windsor Castle, Richard Gibson (1615–1690), Mrs. Rosse, his daughter, who cleverly imitated the work of Samuel Cooper, and other painters, such as Flatman, who was also a poet, Nicholas Dixon, Sir B. Gerbier and Charles and Mary Beale. All these made use of opaque colours.

Just before 1768, there was a fashion for extremely small

miniatures, still, however, painted upon cardboard or occasionally upon vellum, and the work of such artists as Gervase Spencer (d. 1763), Hone and Scouler should be noted.

In the 18th century, we come to the earliest use of ivory as a suitable material on which to paint portrait miniatures. This provided miniature painters, especially those of France, with exactly the most suitable material upon which to use the newly discovered transparent colours. The establishment of the Royal Academy (1768) was largely responsible, in England, for the popularity of the miniature painting on ivory.

Richard Cosway (1742–1821) is usually regarded as the principal English exponent of the art, so much so that for a long time when little was known of other artists, miniatures on ivory specially well painted were invariably attributed to him. His works are brilliant and of considerable beauty, his dexterity being so great that the portrait, to use the words of a well known critic, looks as if it was blown on to the ivory, and was gently resting there. With all their beauty, however, Cosway's miniatures possess many faults in draughtsmanship, and these were exaggerated by one of his successors, Andrew Plimer (1763–1837) whose delightful portraits are often marked by forced chiaroscuro, experiments in strong colour and most inaccurate drawing. Plimer had a brother Nathaniel, who did better work than did his elder brother, and his miniatures are much smaller, and more difficult to acquire.

Perhaps the most popular man of this period was George Engleheart (1750–1829), who was responsible for nearly 4,000 miniatures, a careful account of which he kept in his ledgers. His work is bolder and stronger than that of Cosway. His paintings are usually signed by an initial, and often dated.

The most skilful draughtsman of the period was John Smart (1741–1811) whose work excelled all that of his contemporaries in its silky texture and elaborate finish, and in the extreme skill with the flesh, perchance sometimes too ruddy in colour, is painted. Amongst all the group, Smart alone seems to have had a profound knowledge of anatomy.

One of the most delightful miniature painters of the day was Ozias Humphry, whose work is broader than that of his contemporaries, and who was in many respects an original genius. Towards the end of his life, owing to failing eyesight, he had to devote his time to pastel painting. Nathaniel Hone and his son Horace Hone, Peter Paillou (1740–1800) and William Wood (1768–1809) are painters who stand out in somewhat marked fashion.

At the end of the 18th century, another group of artists come into view, such as Shelley, whose best portraits are groups of two or three persons, Hargreaves, a Liverpool painter, Mrs. Mee, who was responsible for a large number of portraits, Edridge, who drew also in pencil full length portraits, colouring the faces in miniature fashion, as did Cosway, Nixon, Collins, Crosse and others.

Lawrence and Raeburn, in the early part of their career, both painted miniatures, but works that can be definitely attributed to either of them are extremely rare, and can very seldom be identified. Hoppner is said to have painted one or two miniatures, one only is known bearing his signature.

Andrew Robertson started quite a new fashion in miniature portraits, desiring to make them more like small-sized paintings in oil, but his pigments were water-colours used with extreme skill and great knowledge. His paintings are particularly brilliant and also often executed with a very dark background, and full of dignity and force. The desire gradually came about in his time, and the time of those who followed him, to have much larger portraits than had hitherto been called miniatures, and at that period there was introduced the process of flattening out curved slices of ivory by hydraulic pressure. This enabled such men as Sir William Ross, Chalon, Newton and Thorburn to paint portraits of unusually large size, as large, and in some cases, larger than an octavo sheet of paper. In some instances, the ivory, by reason of climatic changes, has returned in a slight degree to its original curved shape, and hence these larger miniatures are often slightly cracked. Of this latest school, Chalon and Newton were the only two who worked in broad masses, the others, notably Ross, had an almost microscopically minute technique, and invariably worked under a magnifying glass.

All this school devoted too much attention to costume and accessories, and too little to the representation of the human face, presenting their works, moreover, in full direct light, with but little shadow, and comparatively formal and stiff in their positions.

Among modern miniaturists the work of Alyn Williams is of marked distinction and importance, and he has gathered about him a group of excellent modern miniature painters, but it would be invidious to name any others than Miss Brunton, whose work is so distinctive and almost miraculous in its combination of minute treatment and broad effect, that it stands out in sharp relief. Lately, an effort has been made to move away from the accepted microscopic minuteness to an effect of broader painting with excellent results, and even the modernist school has its exponents amongst the miniature painters of the present day, who aim at showing that the art is a living one, and that it progresses with the steady evolution that should characterize all artistic movements.

United States.—In the United States there have been many notable miniature painters. The earliest that can at present be identified was John Watson (*c.* 1715), who drew small portraits in pencil and in India ink. C. W. Peale was the most notable of the Philadelphia painters, and his works exhibit much charm. In Charleston (S.C.), Henry Bembridge did admirable work in about the middle of the century. Miniaturists who must be specially mentioned in connection with New York are J. S. Copley, Henry Pelham and Joseph Dunkerley, while John Ramage was also notable and for a while was known in connection with Boston also. Two Scotsmen, Archibald and Alexander Robertson, went out to America towards the end of the century, and did admirable work in miniature painting, as did also another Robertson, an Irishman named Walter. The best native talent in the United States belongs to a Rhode Island man, E. G. Malbone, and with him should be mentioned Benjamin Trott from Boston and Charles Fraser from Charleston; the latter continued to paint down to 1850. Perhaps the most famous of all was named Robert Field, who was responsible for some of the very finest miniatures ever painted in America. He is the subject of a notable book by H. Piers, *Robert Field* (1927) recently issued concerning him. Two New Englanders amongst the very last of the American miniature painters were Alban Clark of Massachusetts and R. M. Staigg of Newport, and in the early part of the 19th century, one ought not to forget to mention Henry Williams of Boston and Sarah Goodridge, and in New York, Dickinson, Wood, Inman and Cummings.

France.—In France, there has always been a very important series of miniature painters. Amongst the earliest portraits on vellum and paper were those painted by Clouet, father and son, Perreal and Fouquet, and following them is a long series of excellent painters who were, in almost every case, admirable draughtsmen and good colourists. Some of the finest portraits painted in France were, however, the work of a Swede named Pierre Adolphe Hall (1739–93), who, during the Pompadour period, was an exceedingly popular artist. A great painter was the Austrian, Heinrich Füger (1751–1818), who painted single portraits and groups on ivory in amazingly skilful fashion, charming graceful compositions in excellent colour.

Of French painters, amongst the best known are Dumont, Sicardi, and in later days Isabey and Augustin; the former died in 1855 and the latter in 1832. Probably no Frenchman painted portraits more skilfully than did Augustin, and those he produced of the great Napoleon are unequalled for beauty and brilliance.

Quite another school of miniature painters was represented by Fragonard, whose portraits are painted with a brush very full of colour in exceedingly broad manner, with a marked absence of the excessive minuteness of technique which is usually exhibited in a miniature painter's work. Other names that ought to be mentioned are those of Drouais, Nattier, Largilliere and Périn. The great Boucher also was responsible for a few miniatures.

Spain.—In Spain, Goya produced some excellent works, and there are also many other notable painters in Spain, who executed good miniatures.

Italy.—Rosalba Carriera (1675–1757), the famous Venetian

pastellist, was also a notable miniature painter.

TECHNIQUE

One is not able to speak with certainty respecting the vehicles that were used by the earlier painters (*see* G. C. Williamson, *The Art of the Miniature Painter*, 1926). Probably Holbein's portraits were executed with a distemper vehicle, either the white or the yolk of egg, or both combined, and it has been stated that by analysis absolute proof has been obtained of Holbein's use of albumen, and of his arrangement to neutralize the alkaline action of the albuminous liquid by means of weak acetic acid. Hilliard certainly ground his colours with gum arabic, and other gums similar to that were used by those who followed him. Sugar candy also was used, sometimes in lieu of the gum, and sometimes in connection with it, and honey has also been mentioned as one of the vehicles used by these painters. The use of glycerine as a vehicle did not come about until after 1800. Hilliard certainly painted upon parchment, especially upon what he calls abortive parchment, and with long, slender, highly pointed brushes, in some cases made from the hair of the English squirrel. The use of opaque colours by miniature painters continued during the 18th century, in some instances we know exactly what they were, because Bernard Lens painted his own portrait with his palette, dated 1724, and shows on it the actual colours set on the palette.

Respecting the colours used by the artists who painted on ivory, we have ample details, as many of them have left behind specimens of their colours and information concerning their technique and media.

Painting in oil upon copper, or very occasionally upon silver plates was an art that was peculiarly characteristic of the Netherlands and also of Italy. There was a long series of artists about whose art history we know very little, who in Holland produced numberless miniature paintings of this kind. They are seldom signed. The English and French miniature painters produced very few oil paintings on metal, in fact, hardly a single example can be attributed to any of them with certainty. In Italy, the art was more usually accepted, and there are several painters, particularly of the later Bolognese school, who are known to have practised this art, but small oil portraits on copper attributed to the great masters, such as Tintoretto in Italy, and Velasquez and El Greco in Spain, must be considered as having names attributed to them very much at haphazard. We have no evidence to support such a contention, but a considerable amount of evidence to set against it. There is a bare possibility that some of them may have experimented in such a medium, but they have left no record of such experiments, either amongst their papers or in contemporary records or by means of their own signatures.

Portraits in Enamel.—The art of portraits in enamel is an important section of the study of portrait miniatures. The very finest works of this kind were produced by Petitot (1607–1691) who worked under Louis XIV., and whose son succeeded him in the same profession. Among the chief exponents of this art who sometimes came and settled down in England, Boit and Zincke may be mentioned as examples. Enamel portraits required the greatest possible skill and a never-ending patience to produce them. A few moments too long exposure in the kiln might entirely ruin the work of a very long period. We do not even yet know how Petitot painted some of his very finest enamels, and what method he adopted for burning them. Some of his best are on gold instead of copper plates. The greatest English exponent of the art was Henry Bone, and there are many other members of the same family who were closely associated with him in producing fine portraits in enamel. Painters in enamel frequently also copied well known works that had been executed in oil, producing small-sized reproductions of great charm and beauty, with the added advantage of being imperishable and almost indestructible. (*See* PENCIL DRAWINGS; PAINTING; PORTRAITURE.) (G. C. W.)

MINIM (adapted from Lat. *minimus*, the smallest; a superlative formed from the Indo-Germanic root *min-*, small), the smallest possible part of a thing, a particle. In music the name "minim" (*nota minima*) was given by mediaeval musicians to a note whose value was half a semibreve. It was, as its name implies, the note of the shortest duration then in use. In modern music several notes of lesser value, as the "crotchet" and "quaver," have been added, and the minim is now about halfway in the scale of "values." According to Thomas Morley (*A Plaine and Easie Introduction to Practical Music*, 1597), its introduction into manuscript music is ascribed to Phillipus de Vitriaco, a musician of the 14th century. In medicine a minim is the smallest fluid measure.

MINIMI (or Minims), members of a Catholic monastic order founded in Italy in 1435 by St. Francis of Paula. The first rule of the order followed closely that of St. Francis of Assisi, but the second (1501) and third (1506) showed more independence. By the year of the death of St. Francis of Paula, 1507, the order had spread to France, Spain and Germany. In 1623 there were 359 convents and 6,430 members. After the French Revolution the number declined rapidly. In 1910 there were 19 convents, 15 of them in Italy, with about 330 friars.

MINIMUM WAGE. A wage-rate fixed either by collective agreement, or (more commonly) by legal enactment, or by some other means, as the lowest wage payable to workers either generally or in a particular craft or grade. The phrase is most frequently used in connection with the various minimum wage laws passed by numerous countries in recent years, and especially in Australia and Great Britain. But it has no necessary reference to a legal minimum; and the phrase is also used to describe wages arrived at by collective bargaining, or adopted as minima by employers without either bargaining or legal compulsion. These other uses, however, raise no special problem; and this article is concerned with the discussion of the *legal* minimum wage.

The idea of enforcing a legal minimum wage is closely bound up with the idea that society has certain obligations to safeguard the life-standard of its members. "Free" contract, without State interference, is in most countries still regarded as the normal method of determining the conditions of employment, but exceptions to this rule are more and more widely recognized. Just as one country after another has been driven, by the hard compulsion of facts, to build up a system of factory and similar legislation for the purpose of preventing inhuman and anti-social conditions of employment, so the evil of "sweated labour" is compelling them to legislate for the enforcement of wage-rates high enough to ensure for those covered by them employment at a "minimum standard of civilized life." Nowhere, indeed, has this purpose yet been wholly achieved; but the minimum wage laws now in force in various parts of the world represent a considerable advance.

While this has been the outstanding motive behind legislation for the enforcement of a minimum wage, it has in certain cases been intertwined with another—that of checking the development of strikes and industrial unrest. In Australia especially the laying down of enforceable minimum rates has been often combined with the prohibition of strikes and lock-outs and the enactment of compulsory arbitration. Where this is the case the rates of wages enforced by law are in effect maximum as well as minimum rates, whereas under systems of pure minimum wage legislation there is nothing to prevent the demanding or payment of higher rates. Thus, under the British Trade Boards Acts, only pure minimum rates are prescribed, and the workers, or their trade unions, are left perfectly free to claim, and, if they think fit, strike for, higher rates. On the other hand, the rates of wages fixed by the justices after the Black Death and in Elizabethan times began

as maximum rather than minimum rates, and only came later to be minima as well as maxima. At the time of their institution, the object was to prevent, not sweating or underpayment, but the rise of wages above a conventionally accepted standard.

The Elizabethan wage legislation, which fell gradually into disuse during the 17th and 18th centuries, was finally repealed in 1813, after the weavers and other classes of workers, whose wage-standards had been depressed by the Napoleonic wars and the Industrial Revolution, had vainly attempted to use it for the raising of wages by State aid. A minimum wage bill introduced by Samuel Whitbread in 1795, largely on behalf of the agricultural workers, was thrown out in face of the dominance of the ideas of free contract and the iron law of wages. Not for more than a century after Whitbread's failure was the British State to begin the direct legal regulation of wage-rates, though factory legislation made a timid beginning in 1819, and important truck acts, regulating the form in which wages might be paid, were passed early in the 19th century. In Great Britain, until the Trade Boards Act of 1909, the State contented itself with legislating against truck, and with the provision of purely voluntary machinery for conciliation and arbitration under such acts as the Conciliation Acts of 1867 and 1896.

Minimum Wage Acts.—The provision by law of machinery for prescribing legally enforceable minimum rates of wages began in 1896 in the Australian State of Victoria. Under the act of 1896, with later amendments, wages boards were set up in one trade after another, consisting of equal numbers of employers and workers, with an impartial chairman. These boards were given power to fix minimum rates enforceable on the employer; and provision was made for a court of industrial appeals. South Australia followed Victoria's lead, and established boards of a broadly similar type. Other Australian States, and later the Commonwealth of Australia, followed a different plan, already started by New Zealand in 1894, and introduced in varying forms the system of compulsory conciliation and arbitration, under which the rates fixed were binding on both parties, and not as minima on the employer alone.

The British Trade Boards Act of 1909 was based on the Victorian precedent, in that it set up boards for particular trades, with impartial chairmen (to whom it added certain impartial "appointed members"), and with power to fix binding minimum rates, but without any powers of compulsory arbitration. As this act and the still more important Trade Boards Act of 1918 are fully described in a separate article, they are not further dealt with here, save as illustrating the general principle of the legal minimum wage. Nor is there space in this article to deal with the widely varying experiments in minimum wage legislation which have been made in other countries. (*See* WAGES, and under the countries concerned.) It need only be said here that in both Europe and America the greater part of this legislation is confined to women workers, while many of the European acts deal only with home-workers. The French act of 1915, for example, is limited in both these ways.

The decision to institute some sort of minimum wage legislation in Great Britain followed on the Liberal election victory of 1906 and the return to parliament of a Labour Party which then for the first time became formidable enough to exert a real influence on the policy of the State. The ground for the act of 1909 was prepared by the exposures of the evil of "sweating" by the National Anti-Sweating League and other bodies, as well as by trade-union agitation. At the outset, two possible courses presented themselves. The State could have aimed at enforcing, over the whole range of industry and employment, a single minimum rate of wages (or perhaps different minima for men and women, boys and girls). But any such rate or rates would have necessarily been very low, as they could only have been based on the situation in the worst-placed industries. As in Victoria, the alternative was preferred of setting up a distinct board for each trade or industry, each with power to prescribe a rate or rates for the particular trade concerned. The boards were also given power, if they thought fit, to prescribe different minima for different localities; but they chose, as a rule, rather to fix minimum rates for a trade over the whole country, with the object of bringing the worse areas gradually up towards the level of the better.

The act of 1909 was only experimental, and covered only a few specially selected trades. The act of 1918 brought in many more (for details *see* TRADE BOARDS); but the regulation of wages by the State was still treated as an exceptional measure, and was extended only to trades in which, because the wages paid were abnormally low or no satisfactory machinery for collective bargaining existed, a special case of regulation was held to exist. In the great mass of British industries, including most of the great basic services, no legal minimum wage exists to-day. The Trade Boards Acts apply to about three million workers, out of a total employed population of 20 millions. The agricultural labourers, whose wages were first regulated by law by the Corn Production Act of 1917, have now a minimum wage fixed separately for each county under the Labour Government's Agricultural Wages Act of 1924. The miners, too, have a Minimum Wage Act passed in connection with the national mining strike of 1912; but, as will be seen, this is not a true minimum wage measure.

Though the trade-board method has been gradually extended to new trades—until further progress was stopped with the coming of the post-war slump in 1921—very many classes of low-paid workers are still outside the scope of any form of State wage-regulation. With many of these it would be possible to deal by the creation of more trade boards; but any such project is bound to encounter at least two difficulties. The Trade Boards Acts have been applied so far only to trades in which a large proportion of the total number of workers employed has been in receipt of exceptionally low wages. But many sections of low-paid workers are to be found in industries in which, taken as a whole, the rates of wages are relatively high. If the acts were applied to these cases, it would be necessary either to apply them to the whole trade or to the underpaid sections only; and in either case this would involve a new principle. The trade unions and employers would probably be alike opposed in many instances to the former method; while the latter would involve considerable difficulties of demarcation.

Moreover, even if the acts were extended as widely as possible to clearly defined trades, there would remain a large residue of workers, including many of the worst paid, employed in ill-defined or scattered occupations for which it would be difficult to establish any wage-fixing machinery on trade-board lines. It has been suggested that, in order to legislate for workers of this type, there should be set up some sort of general board, with power to prescribe minimum rates for any classes of workers for whom the establishment of a special board is difficult or inexpedient.

Coal Mines Minimum, 1912.—The Coal Mines Minimum Wage Act of 1912 stands in quite a different class from the legislation discussed above, and cannot properly be regarded as a minimum wage act at all. It was passed primarily in order to remedy a grievance peculiar to the mining industry—that of the man who, finding himself in an "abnormal place" in which coal-getting is especially difficult, is unable at piece-work prices to earn a reasonable wage. The act of 1912 provides for the payment to such a man of a minimum wage based on the wages actually in force in the district concerned. Thus, if the district wage fixed by collective bargaining falls, the legal minimum falls too. The act is designed, not to secure a particular rate of wages, but merely to protect individuals from earning, owing to conditions beyond their control, less than a standard established by the ordinary process of collective bargaining. It has, therefore, been of no effect in dealing with the severe fluctuations of miners' wages recently.

In general, the question of the legal minimum wage is bound up with the wider question of the State's duty to secure for all its citizens a reasonable standard of life. In Australia, where the conception has been furthest developed, the minimum wage has been gradually forced up in accordance with an expanding conception of the minimum standard of civilized living. The growing practice has then been to define in relation to human needs a "basic" wage, which is then established as a general minimum, rates in particular trades being fixed at varying levels above the

basic wage. In other countries, including Great Britain, legislation has been introduced only with great caution, and the boards entrusted with the task of fixing minimum rates have been guided largely by the immediate "ability to pay" of the trades concerned, with the result that they have had relatively little effect in raising the general standard of living. During the past few years, indeed, the tendency has been towards a narrow interpretation of their functions and powers. Under these circumstances, the often expressed fears that the fixing of minimum rates might "drive trade out of the country" have not been verified. In certain trades—notably tailoring—there has been some tendency to stimulate factory production and the use of machinery in place of home work and the small workshop. But on the whole the acts have had relatively little effect on the structure or organization of industry. They have, however, never been used in Great Britain with the purpose of bringing about any general rise in wages, and their utility has in practice been limited to the prevention of some of the grosser forms of "sweating." Within this limited sphere minimum wage legislation has undoubtedly produced good results, and would produce better if a more adequate system of inspection were provided. The number of inspectors is, however, still too small to ensure full enforcement of rates prescribed.

United States.—The fixing of wages of employees has not been favoured in the United States. Because of constitutional limitations on the powers of the legislatures and because of public opinion, legislation attempting to fix wages has followed tendencies different from those in other large industrial nations. Legislation fixing the wages of public employees and those engaged upon public works has been upheld as constitutional. Some acts, with regard to employees engaged on public works, fix a flat minimum rate while others provide that the rate shall be the "prevailing rate of wages" in the vicinity where the work is being done. With reference to private industrial enterprises the courts have recognized a difference between those affected with a public interest (as railroads) and other private industries. With reference to industries affected with a public interest there seems to be a tendency to recognize the power of the legislatures to fix wages at least in emergency cases. As to other private industries the courts do not look upon the fixing of wages of men, women and children in the same light. As to men in private industry the legislatures have not taken any action to fix wages, except by the compulsory arbitration law of Kansas which has been held unconstitutional. Minimum wage laws covering women and children in private employment have been passed and have received considerable attention since 1912. Massachusetts was the first State (1912) to enact one of these laws. The following year 8 States, California, Colorado, Minnesota, Nebraska, Oregon, Utah, Washington and Wisconsin passed laws. In 1915 Arkansas and Kansas acted. In 1917 the Arizona legislature passed a minimum wage act and the following year (1918) Congress passed a minimum wage act for the District of Columbia. In 1919, 3 laws were passed, North Dakota, Porto Rico and Texas, and since then, only South Dakota, 1923, has passed a law on the subject. Though 17 laws were passed only 15 are now on the statute books as Nebraska (1919) and Texas (1921) have repealed their acts.

With the exception of Massachusetts the States having minimum wage acts are not important industrial States. Most of the laws are general in their enumeration of industries covered by the act with a tendency to except domestic service and similar employment from the terms of the act. Most of the acts apply to male minors as well as females but some of the acts are limited to females only. The States may be divided into two groups according to the method of determining wage rates. Four acts, those of Arizona, Porto Rico, South Dakota and Utah, fix flat rates. Arkansas fixes a flat rate but gives power to a commission to change the rate. The other 12 acts provide a more flexible system. In these States an administrative body is created having power to establish minimum rates. In two of these, Massachusetts and Nebraska, the force of the rates depends upon public opinion. The administrative bodies created by the acts are of two kinds. Permanent and general bodies are intended to be permanent continuing bodies and generally are not restricted to the subject of minimum wages but have general powers as to the conditions of employment of women and minors. Advisory and special bodies have duties usually limited to the investigation of conditions and the making of recommendations. Advisory boards are provided for in most of the minimum wage acts. Various provisions exist concerning the personnel of these advisory boards but generally the employers, the employees and the public are represented. Many of the laws provide for the granting of special licences in the case of substandard workers who, because of age or physical or mental condition, cannot earn the standard wage.

The non-compulsory Massachusetts law was upheld as constitutional in the State courts. The Oregon Act of 1913 became the basis of an important test case. After being upheld in the State courts, the case was taken to the Supreme Court of the United States where it was argued Dec. 16–17, 1914, and reargued on Jan. 18, 1917. The court divided equally 4 to 4 on the question of constitutionality and the decision of the State court upholding the act was sustained April 9, 1917 (Mr. Justice Brandeis, who had originally appeared as attorney for the law, not voting). Partly because of the doubt as to the constitutionality of the acts the development became slow. After the passage of the District of Columbia Act in 1918, and with four changes in the personnel of the Supreme Court bench a new test case was taken to the Supreme Court of the United States. That court, by a five to three decision (Mr. Justice Brandeis not participating), held the act unconstitutional on April 9, 1923, in the case of *Adkins* v. *Children's Hospital*. This decision was followed in 1925 and 1927 by *per curiam* decisions holding the Arizona and Arkansas acts unconstitutional. Several of the States have accepted the Adkins case as controlling but have continued to enforce the acts with the voluntary co-operation of some employers and without prosecution for violation of the acts. The Adkins case seems to be limited to the application of the act to women and not necessarily as applied to children. The Massachusetts non-compulsory law is being enforced. Wisconsin in 1925 passed an act intended to save the constitutionality of that act by bringing it within the limitations laid down in the opinion in the Adkins case.

MINING ACCIDENTS: *see* COAL AND COAL MINING; DANGEROUS TRADES; INDUSTRIAL ACCIDENTS.

MINING ENGINEER. This term may be broadly considered to include anyone who is engaged in the extraction of minerals from the earth. The work of the mining engineer includes prospecting (*q.v.*) for deposits and various minerals, the development of mining methods and works required for the exploitation of proven deposits, and the installation of the necessary equipment above and below ground.

The mining engineer should be of rugged physique, capable of undergoing serious hardships. He should have an active and imaginative mind and must be able easily to adapt himself to varying circumstances. Above all, he must be an able executive. Because of consolidations and the centralized operation of mining properties, the number of mining engineers required is decreasing. While the training and experience at present expected of the mining engineer is much broader than formerly, in many instances it is true that continual broadening of the field is forcing him to specialize in some certain phase of the mining industry. Thus, there is a sharp distinction between a coal mining engineer and a metal mining engineer. Opportunities for the general mining engineer are, perhaps, greatest in Asia, Africa and South America where much pioneer work yet (1929) remains to be done.

A mining engineer should have a knowledge of the kinds and methods of mining and the fundamental sciences that are the foundation of all technical education. He should also be familiar

with geology, mineralogy, chemistry and the principles of mechanical, electrical and civil engineering. He should have a general knowledge of mining law and metallurgy. (F. J. G. Du.)

MINING, METALLIFEROUS, the winning of metals and their ores from the ground. Metals, in their pure state and also mechanically and chemically combined with other substances, occur all over the earth's surface. These deposits of metals and metal ores vary in extent and metal content and in their depth under the surface of the ground, which gives rise to different methods of mining. The broad classification of these methods, which is used by the American Institute of Mining and Metallurgical Engineers, divides metalliferous mining into two main fields: open-cut mining and underground mining.

Classification of Mining Methods

- Open-cut, with or without Stripping.
  - Benches
  - Glory-holes and milling
  - Placer mining
    - Hand sluicing
    - Dredging
    - Hydraulicking
- Underground Methods.
  - Breast Stoping. (Tabular, flat-dipping deposits or beds.)
    - Continuous horizon
    - Casual pillars
    - Room-and-pillar
  - Underhand Stoping. (Veins and large masses.)
    - Glory-hole and milling with pillars
    - Open stope
      - with stulls
      - with square-set timbering
  - Overhand Stoping. (Steep dipping veins or masses.)
    - Open stope
      - with pillars
      - with stulls
      - with square-set timbering
    - Filled stope
      - Horizontal cut and fill (flat-back)
      - Inclined cut and fill (rill)
      - Square-set timbering
      - Resuing or stripping
    - Shrinkage stope
    - Sub-level stopes
  - Top-slicing. (Wide veins or masses.)
    - Continuous horizon
    - Panel slicing
    - Block slicing
    - Inclined slicing
  - Caving. (Large masses.)
    - Sub-level caving
    - Block-caving
      - Undercut from main level
      - Undercut from sub-levels
      - Block-caving into chutes
      - Block-caving with branch raises
- Combined Methods. (Large masses.)
  - Alternate shrinkage stope and pillar, pillars mined by top-slicing, sub-level caving or block-caving
  - Square-set timbering: pillars mined by slicing.

OPEN-CUT MINING

This term is applied to the working of metalliferous deposits which either outcrop at the surface of the ground or are covered by a shallow overburden or capping which must be removed before the ore can be mined. Since the cost of removing the overburden is charged to the cost of mining, a point is reached, as the cover increases in thickness, beyond which open-cut mining does not pay and some method of underground mining must be used. Large deposits of copper and iron ores are worked by open-cut mining, usually by the bench method. The depth of capping varies from a few feet up to 300 feet. Power-driven shovels work on benches loading the ore into cars running on a track placed near the edge of the bench. The material is loosened by blasting, and care should be taken that the pieces are small enough to be handled easily by the shovels. The height of bank is determined by the thickness of the deposit, the size of the shovels used, the physical character of the ore and climatic conditions. The higher the bank the more material the shovel can handle from one position, but the greater is the danger of a slide burying the shovel and of falling rock injuring the men. The material may stand at a high angle when dry, but slides may occur in wet weather. Thick deposits are worked in several benches. The slope of the bank varies at different mines, but for preliminary investigations may be taken as 45° from the horizontal, giving a general slope of from 38° to 40° for the entire side of the cut.

The shape of the ore body has an important bearing on the feasibility of open-cut mining. Due to the slope which the sides of the cut must take, a narrow ore body cannot be mined as

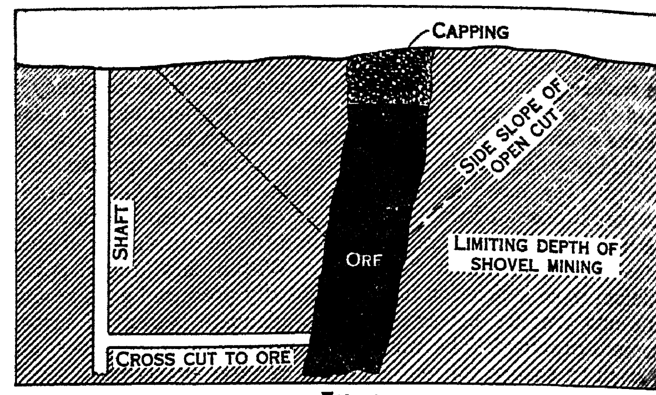

FIG. 1

economically by this method as a large flat lying deposit. If the deposit is irregular in outline it may be difficult to prevent diluting the ore with waste. Even under favourable conditions, it is seldom possible to mine the entire ore body without resorting to underground mining for some part of it. Fig. 1 illustrates how side slope limits the economical depth of open-cut mining. To carry shovel working to greater depth would require the removing of too much overburden, so for deeper working some method of underground mining must be used.

The electrically operated shovel fitted with caterpillar tread is superseding the steam shovel, especially in large scale work. The electric shovel eliminates the problems of water and fuel supply, which are of especial disadvantage in cold weather. Power-shovel work, due to the high cost of equipment, must be on a large scale, and consequently can be economically applied only to large ore deposits, in which case it gives a large output at a very low mining cost. Ample dump room must be available, if much capping is to be removed. No timbering is required; however, the surface of the ground is destroyed for further use, bad weather may seriously interfere with operations and a large outlay of capital is required.

Glory-hole Mining.—In this case a vertical connection or raise is driven to the surface from an underground haulage way. The top of this raise is broken out to form a funnel-shaped opening, which is widened and deepened by drilling and blasting around the inside. The broken ore slides down the funnel into the raise which serves as a chute, the ore being drawn off through gates into cars on the haulage level. This is a cheap method of mining, but it is dangerous especially if pieces of the wall tend to break off and the excavation is large. A series of holes may be mined until they intersect. The intervening ridges are then worked out. The entire operation of getting the ore into the chutes is called "milling."

PLACER MINING

Placer mining is a general term applied to deposits of minerals accumulated into workable quantities of economical importance through the natural processes of erosion and concentration. The heavy and not easily decomposed minerals in the parent rock are freed as the rock is broken down, and are sorted by the action of water and concentrated in the lower parts of stream beds. *Alluvial*, used largely in the British Empire, is applied to placers formed by the mechanical action of moving water, whether of streams, lakes or oceans. *Eluvial* is a term applied to placers found close to the parent rock, *see* fig. 2. Erosion has set free the gold which has worked down the slope due to the combined action of gravity and rains. Once a flowing stream is reached the gold may be carried a long distance before it is deposited. A placer deposit may be formed by one or more of a number of different minerals.

Placer deposits are found in present stream beds, in benches above present streams, in elevated channels of ancient streams now cutting across present drainage (as the White Channel placers of the Yukon), in gravels deeply buried (deep leads) beneath present streams or covered by lava flows. They have also been discovered at the mouths of streams flowing into lakes and as beach deposits formed by the breaking, transporting and sorting action of waves. Some beach deposits have been elevated above the present ocean level. Workable placers have also been formed by the action of wind, which carried away the lighter minerals leaving a residual concentrate of economic importance.

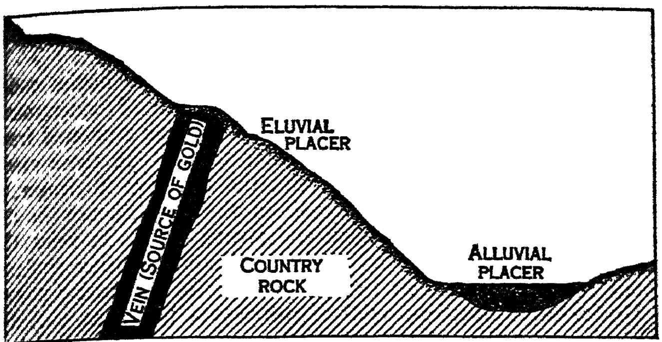

FIG. 2

The size of placer gold varies from nuggets of 2,000 oz. troy or more to such fine flakes that 2,000 of them are worth only 1 cent. Gold coated with silica, oxide of manganese or iron oxide will not be caught by mercury. Small pockets of auriferous gravel are worked by the pan or the rocker. A rocker is a small wooden trough or box mounted on two transverse rockers so the device can be given a side motion. By diligent work an experienced panner may handle 1 cu.yd. of gravel in 10 hours. Two men with a rocker can handle from 3 to 5 cu.yd. of gravel in 10 hr. under average conditions.

Sluicing and Hydraulicking.—A slightly sloping wooden trough (box sluice) or a ditch cut in hard gravel or rock (ground sluice) is used as a channel along which gold-bearing gravel is carried by a stream of water. Riffles, in the form of cobblestones, wooden blocks, wooden poles or steel rails are placed along the bottom of the sluice to aid in saving the gold. Sluices vary from 1 to 6 ft. in width and from 1 to 4 ft. in depth, their cross-section being proportional to the volume of material passing through them. Their length should be sufficient to allow the gravel to disintegrate and the gold to settle. This usually takes place in the first 100 to 300 feet. Additional length of sluice is required to save much of the finer gold (sluices are not sufficient savers of very fine gold) and to convey the gravel to the dump. The slope or grade of sluices is commonly specified as the drop in inches in a length of 12 feet. Sections are commonly 12 ft. long. A drop of 3 in., per box may be sufficient for small light gravel, but more common drops are 6 to 7 in. per box. A drop of 12 in. gives a current too swift to permit the settling of any but the coarsest gold.

Sluicing is the term applied to working placers where the gravel is carried to the head of the sluice by shovelling, in wheelbarrows, in small cars, by scrapers, by dragline excavators or by small steam shovels. Large placer deposits are worked by hydraulicking, the gravel being loosened from place and washed into the sluice by powerful jets of water from nozzles called hydraulic giants. To be effective the head of water on the giant should not be less than 200 ft., equivalent to a pressure of 86·8 lb. per square inch. In case more head room is required than natural conditions afford, additional lift of gravel may be had through the use of an hydraulic elevator, a steeply inclined pipe having a nozzle placed inside at the bottom. The gravel is washed into the elevator at a point just above the nozzle and is carried up by the force of the jet. Water for the hydraulic giant is measured in terms of the miner's inch, or a flow of 1·5 cu.ft. per minute. The volume of gravel loosened and washed through a sluice by a miner's inch of water used for 24 hr. varies with conditions of the gravel, the slope of the sluice and the pressure of the water. As a rough guide, under average conditions the duty of a miner's inch is from 3 to 6 cu.yd. of gravel per 24 hours.

Undercurrents are in some cases placed at an intermediate point or at the end of the main sluice to save fine gold. They are short sluices considerably wider than the main sluice, and are set on a steeper grade, generally at right-angles to the main sluice. A screen or grizzly in the main sluice lets the fine gravel, sand and gold pass through but retains the large rocks and sufficient water to move them in the main sluice. The discharge from the undercurrent is either returned to the main sluice through an auxiliary sluice of flatter grade or goes directly to the dump.

Drift Mining is the term applied to the working of placer deposits by underground methods of mining. It is classified under breast stoping. The paystreak is reached through a horizontal opening called a drift or adit (*q.v.*), or through a shallow vertical shaft. Small cars are commonly used for transporting the gravel, which is removed in some system of regular cuts or sluices across the paystreak. Posts and headboards are used to support the roof, but if the gravel is loosed a method of forepoling or tight timbering must be used. Frozen gravel must be thawed before it can be mined. Steam, hot water or cold water have been successfully used as thawing mediums, being forced into the gravel through pointed pipes. Drifting is more expensive than sluicing or hydraulicking and is used only for rich gravels. The thickness of pay gravel is generally between 2 and 8 feet.

UNDERGROUND METHODS

These include the various forms of stoping, top-slicing and caving.

BREAST STOPING

As a separate method of mining this is applied to thin ore deposits that are either horizontal or dip at a small angle with the horizontal. Stoping is the term applied to breaking the ore from place by drilling and blasting. The excavation in which the miners work is called a *stope*. Thickness of deposits worked by this method is not usually over 12 ft., although in modified form this system is applied to beds up to 70 ft. in thickness, as in the Wisconsin zinc district. In thin deposits the entire thickness of ore is mined at one time, thus advancing the working in a vertical face or breast. In thicker deposits the ore is mined in a series of benches. *Continuous horizon* implies a long working face which is attacked simultaneously at a number of points.

In the Missouri lead and zinc region the roof is supported by pillars of ore from 10 to 40 ft. in diameter, placed at irregular intervals. From 10 to 17% of the ore is left in the pillars, this amount depending upon the nature of the floor (hard or soft), the strength of the roof and total weight supported. The recovery of ore from the pillars is low, it being more economical to leave some of the ore than to use artificial means of support. To reduce the cost of mining, hand shovelling is replaced wherever feasible by some form of machine loading. Small power shovels are used in some large stopes. Concrete discs and concrete columns have proved a satisfactory means of support and in some places have supplanted wooden cribs filled with waste.

Room and Pillar.—This method applies to the systematic cutting of the deposit into regular lines of square or rectangular pillars, which later are removed as much as possible. At the Maywood iron mine, Yorkshire, England, a deposit of iron ore 7·5 ft. thick is cut into pillars 54 to 60 ft. by drives 15 ft. wide, leaving some 63% of the ore in pillars, which later are worked out in sections, using posts as temporary roof supports. Finally, the posts are pulled out and the roof settles down over.

UNDERHAND STOPING

As the name implies this is a method of working an ore body from the top down. Holes for blasting are drilled downward. Fig. 3 shows a composite section of underhand mining in a narrow vertical vein. In mining it is customary to concentrate the handling of ore and waste and the distribution of supplies on certain horizons called levels, which are commonly spaced 100 ft. apart vertically, though this distance may be greatly increased in some

mines. The ore mined between two consecutive levels is dropped through chutes to the level below for hauling to the shaft. On any level the passageways driven lengthwise of the vein are called drifts (a single drift may be called a level), and those driven across the vein from wall to wall are called cross-cuts. If the vein is inclined, the upper wall is the hanging wall and the lower wall is the footwall. Two levels are interconnected by verti-

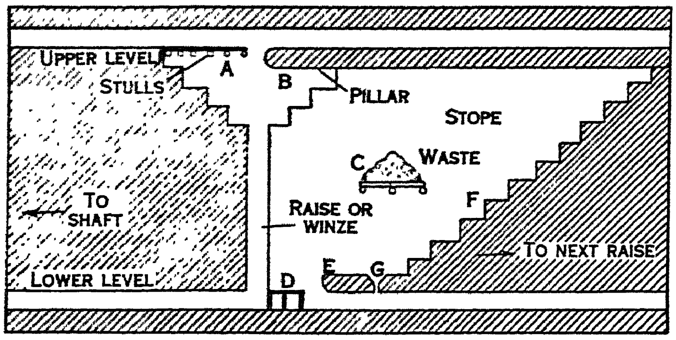

FIG. 3

cal or inclined openings called raises, if driven upward from a level, and winzes, if driven downward from a level. Thus the same connecting opening may be a raise or a winze depending upon which level is used as a reference point. The term back is applied both to the roof of an underground opening or to the entire body of ore between a level and the next one above. Since each main level must have a haulage system and a station must be made at the shaft, a large number of levels in a mine calls for a heavy development expense. To lessen this expense levels may be placed 1,000 ft. or more apart, if the vein is fairly constant in dip and has strong walls, as in some of the Rand mines. Raises are spaced from 100 to 200 or even 500 ft. apart horizontally.

An underhand stope, *see* fig. 3, is started by working outward from the top of a winze in a series of horizontal slices, which tect the lower level and to provide a means of loading cars, the lower level is either timbered, as shown at *D*, or a pillar of ore, *E*, is left, through which chutes, *G*, are cut at intervals of 25 to 50 feet. The face of the ore forms a rough slope rather than a series of steps as indicated at *F*. The angle of repose of broken ore is from 35° to 45°, the steeper angle being for hard ores. If possible, the slope should be such that the ore runs down under the influence of gravity, but in inclined veins it may be necessary to shovel the ore down the slope or to use mechanical scrapers.

Underhand stoping may be applied to large ore bodies under certain conditions. It generally takes the form of underground glory-holes (mill-holes), one series of holes being separated from another series by an intervening pillar of ore. In these cases, as in the working of a narrow vein, the men are in danger of rock falling from the back or walls of the stope, hence the desirability of having a firm back and strong walls. In veins, the maximum width worked by underhand stoping using stulls is about 20 ft., since longer timbers have little supporting power.

Underhand Stoping with Square-sets has been used for mining small bodies of ore. The term square-sets is applied to a flexible system of timber support. A complete set is composed of 12 pieces of timber, four each of posts, caps and girts. As additional sets are added each timber becomes common to four adjacent sets. Round timbers are also used in sets, but they require a different framing. Sets are held in place by short blocks placed at the corners and wedged tightly against the walls of the stope. By extending sets vertically and horizontally this skeleton framework may be shaped to fit a stope of very irregular outline. However, it is an expensive method of support and cannot withstand great pressure. If a few of the timbers are thrown out of line, the entire framework is likely to collapse. The ore is first stoped to make room for the top floor of sets, which are covered with lagging to hold back the sandy capping or back, then the excavation for the floor below is made. The second floor sets are supported from the top floor sets by using

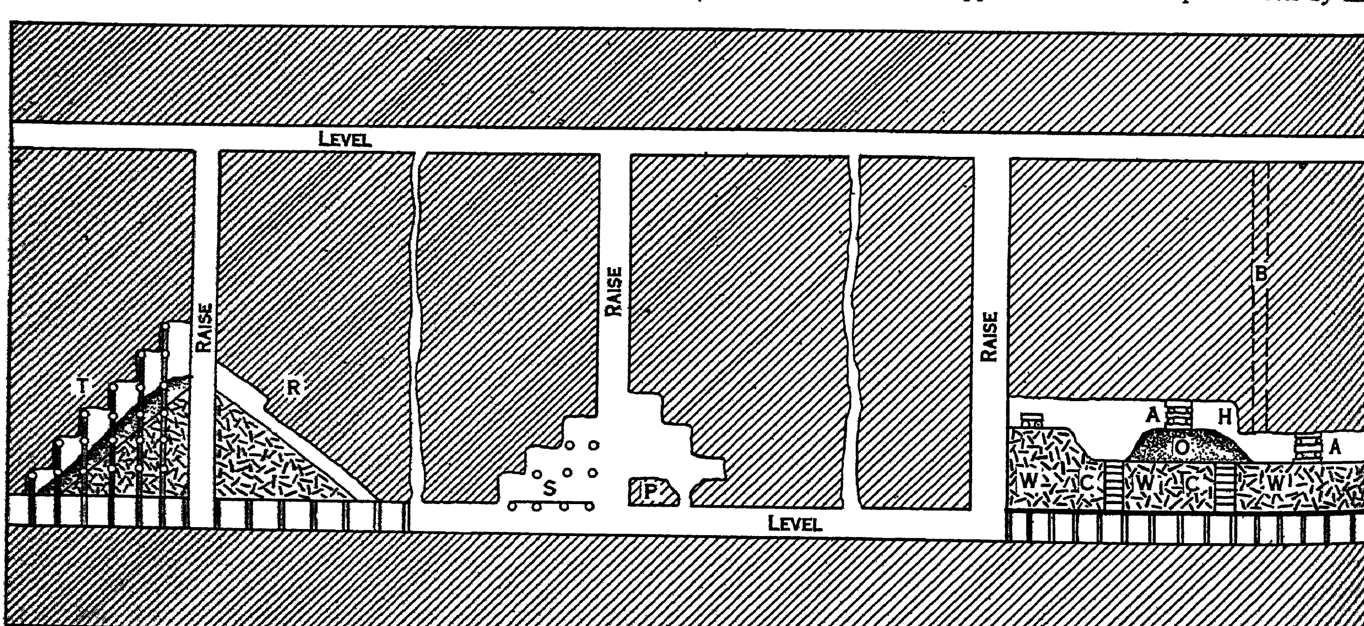

FIG. 4

leave the ore in step-like form. If the ore is rich, timbers called stulls are covered with plank (called lagging) to form the bottom of the level, as at *A*, but if the ore is lean, it is more economical to leave a pillar of ore as at *B*. Should the level be the lowest level in the mine, the ore must be hoisted to the top of the winze. The cost of mining is increased, so this procedure is used only for recovering small bodies of ore below a level. Raises and winzes are generally timbered to afford at least two closed compartments, one to be used as a chute for ore or waste and the other fitted with a ladder to serve as a manway. To pro- chains and planks nailed from a timber in the top set to another in the floor below. The second set timbers are then wedged in place and work on the third floor is started.

OVERHAND STOPING

Open Stopes.—In this system of mining, the stopes are advanced upward, the ore being removed in horizontal, vertical or inclined slices. The stopes are started from the bottom of a raise; either from the top of a protecting pillar of ore, as at *P*, fig. 4, or directly off the level, as at *S*, in which case the level

is protected by stulls or drift sets which are covered with lagging. Stulls used in narrow veins are commonly from 8 to 12 in. in diameter, though sizes up to 30 in., have been used in heavy ground. The upper ends of the stulls are held in place by wedges. Lagging may be plank or round poles. Scattered pillars of ore may be left to support the walls. Though the attempt is made later to recover this ore much of it may be lost. In wide veins so much ore would be required for pillars that square-set timbering is used.

As the stoping proceeds upward the miners must have some support on which to work. For veins having a dip of 40° or less, the men can work from the footwall, but on steeper dips stulls or square-sets are covered with lagging to afford temporary working platforms. Strong walls and firm ore require a minimum of support, and then the stope may be left open.

Filled Stopes.—In case the ore is likely to fall as soon as it is undercut and if the walls are weak a stronger support than can be given by timbering alone is required and filling the stope with waste is resorted to. The waste is secured from sorting the ore (the amount is seldom sufficient), from driving small drifts or inclined raises into the walls of the deposit, or outside the mine. In some cases the tailing from concentrating plants is used. This material may be dry or it may be mixed with water and washed into the mine through pipes in which case the water is drained from the filling and is pumped from the mine. This method is called *sand filling*. The *horizontal-cut-and-fill* or *flat-back* system of overhand mining is shown in fig. 4. At *H* the cut is being made horizontally to the right, the miners drilling holes from the top of the pile of broken ore at *O*. Chutes, *C*, are for drawing off the ore to the level below. These timbered chutes are built up to keep the top just above the waste filling, which is brought in through the upper level and dropped down the waste chute in the raise to be distributed through the stope in cars. As the mining progresses away from the main raise, additional waste raises, *B*, are driven at intervals to save hauling distance. Before a slice of ore is shot down, the waste filling is levelled and is covered with planks. The planks are removed when waste is to be dumped. After the slice *H* has been carried beyond the first waste raise, another slice may be started from the main raise. In this way several sets of miners may be working in a stope. In the Michigan copper mines where this system is followed, the ore is sorted in the stope. At the Champion mine about 53% of the material broken in the stopes is left for filling. The ore chutes are built of large pieces of waste arranged in circular form. Some support to the back may be afforded by cribs built on the waste or on the ore as at *A*, fig. 4, but no heavy weight can be supported in this way. For ore bodies of long horizontal extent, vertical pillars of ore are left at intervals, and additional support is afforded by horizontal pillars left just above and below.

Rill Stoping.—This method, also known as *inclined-cut-and-fill mining*, is a form of overhand stoping in which inclined slices are broken, as is shown at *R*, fig. 4. The method works well where the ore is hard and the walls are firm and regular. The slices or cuts are made either from the top down or the bottom up, the miners standing on the broken ore. After a slice has been shot down and the ore has drawn off at the level, waste is run in from the raise. The waste runs in under the influence of gravity and takes its own angle of repose. A layer of planks is laid on the waste, another slice of ore is shot down and drawn off, and the planks are removed for the next layer of waste filling. Both ore and waste require a minimum of handling. At *T*, fig. 4, stulls and posts are used as support. Here, the broken ore is shown lying on the plank-covered waste. Still stronger support is given by using square-sets. As the stope increases in height the lower point or toe moves away from the raise. The danger of falls of rocks from the back limits the length of the stopes, which in some cases may be only 50 to 60 feet. An ore chute is started from the level at the toe of the slope and is carried up, keeping pace with the waste filling. If two chutes are used, one for waste and the other for ore and a grizzly is placed over the ore chute, the larger pieces of waste may be sorted out. At the Pilares copper mine in Mexico no planks are used in the stope; water is used to wet the surface of the waste before the ore is shot down. After drawing off the ore, the fine material remaining is carefully scraped off the waste before additional filling is run in.

Filled Square Sets.—These offer a flexible method of mining heavy ground. By varying the number of sets opened on the bottom or sill floor of a stope and by limiting the vertical number of sets left unfilled, this system can be made to suit the nature of the ground being mined. If no great pressure is brought on the timbers, a sill floor of say 12 to 15 sets or even more may be opened. In bad ground, the sill floor may be only two or three sets. This area of horizontal cut is carried up to the level above, and then another similar cut is started next to the filled sets, and the operations are repeated. Thus a large block of heavy ground may be safely mined in a series of small vertical slices. In very heavy ground, the filling must be carried as close as possible to the working face. Chutes and manways are made by lining square sets tightly on the inside with vertically placed plank or lagging. Waste is confined within sets by placing lagging horizontally on the inside of the posts and spacing the plank a few inches apart unless the filling is very fine.

Resuing or Stripping.—This term is applied to the mining of rich narrow veins or of veins in which rich ore lies in a streak of less width than the vein. The object of resuing is to mine the ore clean and free from waste, and thus save diluting the ore with waste and sending a larger tonnage of lower grade ore to the mill or smelter. In fig. 5 *A* is the rich streak and *V* is the lean part of the vein. A level *L* is opened and the stoping is carried upward. The level is driven largely in the worthless rock, which is first removed and then the rich streak is shot down, canvas or hides being commonly used to catch the ore since the richest part is generally the finest. The ore should separate easily from the wall of the vein; if it adheres tightly to the wall some waste will be mixed with the ore.

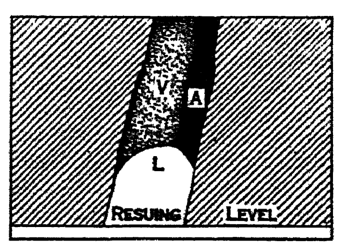

FIG. 5

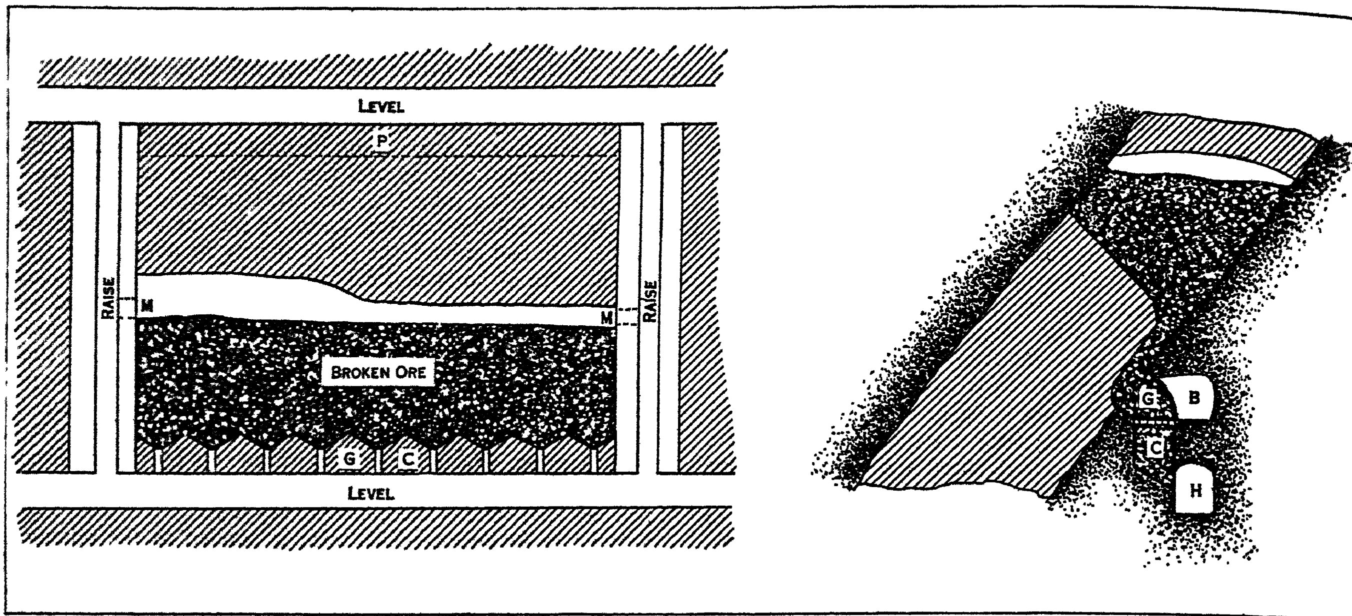
Shrinkage Stoping.—This is also called magazine stoping. The ore is mined by overhand stoping. Only enough ore is drawn from the stope to afford working space to the miners who stand on the broken ore while drilling holes in the back. Broken ore occupies some 60% more volume than ore in place, consequently about one third of the ore must be drawn off, as it is broken, through chutes closely spaced, from 25 to 50 ft., along the bottom of the stope. Two-thirds of the ore is left in the stope. This method of mining is best suited to hard ores of uniform character, with walls which are firm and regular and dip at not less than 60° from the horizontal. The ore should work easily down the stope when it is being drawn. Soft walls are likely to slab off and dilute the ore with barren rock. Sorting is not practised except under unusual conditions, and little timbering is required. Ore that packs in the stope must be loosened by blasting. If the ore breaks in large blocks, these must be drilled with shallow holes and blasted; this is called block holing. One disadvantage of this method lies in the long time the ore is left in stopes, this being two or three years in some cases, and entails high interest charges for carrying the ore.

Fig. 6 shows shrinkage stoping as applied to a large ore body. The lower level is protected by a pillar through which short raises, *C*, for chutes are put up at 25 ft. intervals. Raises are driven through the pillars at the ends of the stope. Short-cuts, driven through the pillars at small vertical intervals, connect with the working space in the stope, as shown at *M*. To prevent large pieces of ore from logging the chutes grizzlies, *G*, are placed at the top of the chutes *C*. A pillar of ore, indicated by the fine line at *P*, may be left to protect the upper level. Later, pillars are mined by another method. Fig. 7 illustrates shrinkage stoping in a steeply dipping vein. The ore passes through the grizzly *G* into the chute *C* along the haulage *H*. *B* is a bulldozing chamber in which men can work at blasting the large pieces which do not pass the grizzly.



FIGS. 6 & 7

Sub-level Stoping.—This mining method was developed in the Michigan iron mines. The principles of the method are illustrated in fig. 8. Main levels are from 100 to 150 ft. apart, and are connected by raise. At intervals of 20 to 25 ft. vertically, sub-levels 7 to 8 ft. high are driven from the raise to the end of the stope. These sub-levels are commonly a single drift down the centre of the stope. By driving cross-cuts at the end, sub-level No. 1 is for a short distance widened to the limits of the stope. Inclined holes are drilled around the chute raises *C* which are put up from the haulage level at intervals of 25 ft. or even less. These holes are blasted to give a funnel-shaped top to the chutes. Holes are now drilled in the back over the sub-level, and a slice in the centre of the stope from level to level and the sub-levels is shot down, the broken ore falling into the chutes. Sub-level No. 2 is taken back by first cross-cutting to the full width of the stope, and then drilling down holes in the floor to remove part of the lower pillar and "uppers" in the back to take out half of the upper pillar. Thus miners in No. 2 sub-level retreat toward the raise, drilling down holes in the slice *B* and up holes in the slice *D*. The ore falls into the chutes. The ore should be firm and free

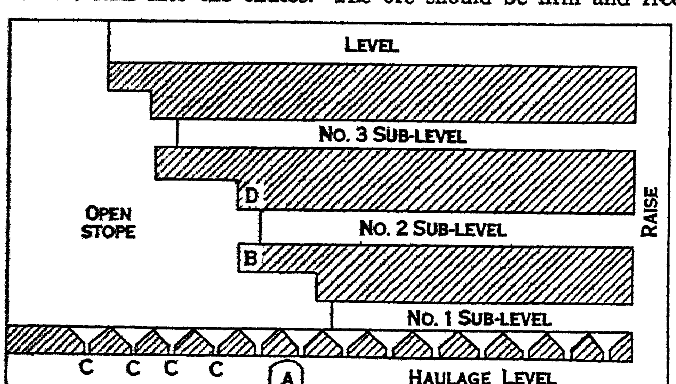


FIG. 8

from slips. The sub-levels are carried back in steps, one working face being some 30 ft. horizontally ahead of that above.

If the walls are soft some waste will fall and mix with the ore. If the ore is hard, the cost of driving the sub-levels and drilling the ore is increased. In long stopes a vertical cut may be made in the centre of the stope from level to level and the sub-levels are carried back each way from this centre point. In wide stopes, 40 to 100 ft. in width, two parallel haulage drifts may be driven. These are connected at intervals by cross cuts as at *A*. This method entails a high cost for development, but requires little timber and gives a large output from each stope because of the several working places. The ore can be drawn out at once. The method is limited to deposits having a dip of not less than 45°, since the ore should work freely down the footwall.

TOP SLICING

This method, developed from methods used in the north of England iron mines, was first used in the iron mines of the United States. Later it was adapted to the mining of copper and lead-zinc ores.

Continuous Horizon.—Mining is done in horizontal slices, 10 to 12 ft. thick, working downward from the top of the deposit. The first slice is taken just beneath the capping, which is supported by timbering. As the slice of ore is taken out lagging is laid on the floor to tightly cover the ore below. The posts supporting the capping are then shot out and the capping caves onto the timber floor or mat. This mat is temporarily supported by the timbering of the second slice. After the ore in the second slice is taken out, a timber floor is laid and the posts are shot out. Thus the timber mat, which serves to prevent the capping from mixing with the ore receives additions as each slice is stoped. From the haulage level a raise, containing a chute and manway, is put up to the top of the ore and a main drift is driven to the boundaries of the block. Cross drifts are turned off at right-angles to the main drift and are driven to the limits of the block. The ore is broken by breast stoping, and is shovelled into cars to be hauled to the chute. The back is supported by timbering. After a cross drift has been completed, the floor is covered with a layer of timber and the posts are shot out, using small charges of dynamite. The overlying capping or timber mat settles down onto the new floor. If capping in a caved drift tends to run into a working drift, the side of the latter is lagged to hold the capping. Since the timber is not recovered, it is as poor a grade as will do for temporary support. In variations of this method a form of square-set timbering is used, and successive cuts may be two sets wide and two or three sets high.

Panel, Block and Inclined Slicing.—A large ore body is not worked in one continuous horizon, but rather is a series of blocks or panels. Inclined top-slicing was devised to save shovelling the ore. The cuts (frequently called slices, though slice seems best applied to the entire series of cuts on one horizon) are inclined upwards from the chute at an angle of 33° with the horizontal, so the ore will roll down to the chute. This method does not permit sorting of the ore in the stope and is more difficult to work than horizontal slicing. The Mitchell method of top-slicing is a modified form in which inclined slices are carried up from a chute at 45° for from 11 to 15 ft. and are then turned horizontally. It is difficult to keep the working drifts open for a long time, hence a large ore body is worked in a series of small

independent units. Top-slicing is applicable to weak ore with poor walls. It is most suitable for deposits of large horizontal extent which have a capping that caves readily. It is a safe method and gives a high extraction of ore, up to 98%. However, the ore is mined by breast stoping and a large amount of timbering is required. The method is being replaced by others in which the ore is largely broken by undercutting and caving.

CAVING

Sub-level Caving.—This method is suitable for the large scale mining of ore that is moderately hard, that has fairly regular limits and a capping which caves readily. The method is used chiefly in the iron mines of the Lake Superior district. Fig. 9 illustrates the principles of the method. Details vary at different mines. From the haulage level (levels may be 75 to 100 ft. apart) raises are put up at 50 ft. intervals, and sub-levels are driven from the raises at vertical intervals of from 15 to 18 ft., leaving a horizontal pillar of ore some 9 ft. thick between the sub-levels. The development work on each sub-level consists of longitudinal drifts, marked No. 1 sub-level, No. 2 sub-level, etc., and cross drifts marked *D*. These are spaced about 50 ft. apart. Mining is started on the top sub-level, No. 4 in fig. 9, by driving a cross drift parallel to *D* across the block of ore at the end of the sub-level. The drift is timbered with three-piece sets of two slightly inclined posts and a cap and is lagged overhead. A second drift is driven alongside the first one, the feet of the posts in the two drifts overlap slightly. By removing a little of the lagging over the first drift, shallow holes can be drilled in the back and the ore blasted. Men in the second drift shovel the ore into cars for tramming to the chutes in the raises. After the ore is removed, the floor of the first drift is covered with a layer of timber, and a third drift is driven alongside the second drift and the operations are repeated. The capping caves and, as it is caught on the timber mat, enough pressure is developed by this weight on the ends of the horizontal pillars of ore to reduce considerably the amount of blasting needed to break the ore.

In fig. 9 the ore over drifts *A* has been shot down. Shovellers in drift *B* have removed this ore and have laid planks on the floor. As soon as a new drift has been driven alongside drifts *B*, mining the ore above *B* will be started. As in sub-level stoping, mining is done in a series of steps. From half to two-thirds of

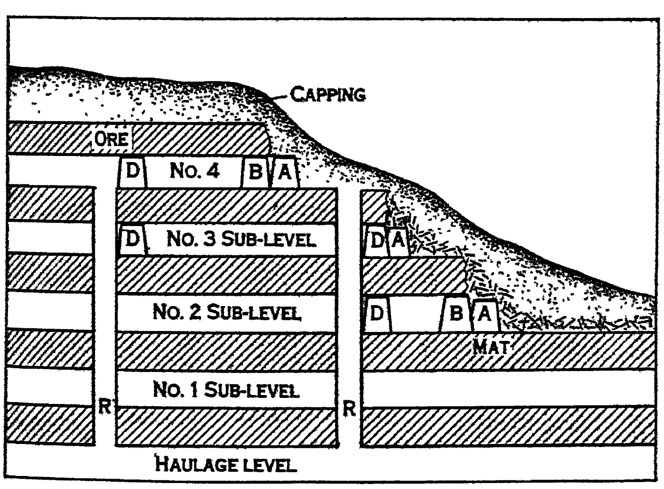

FIG. 9

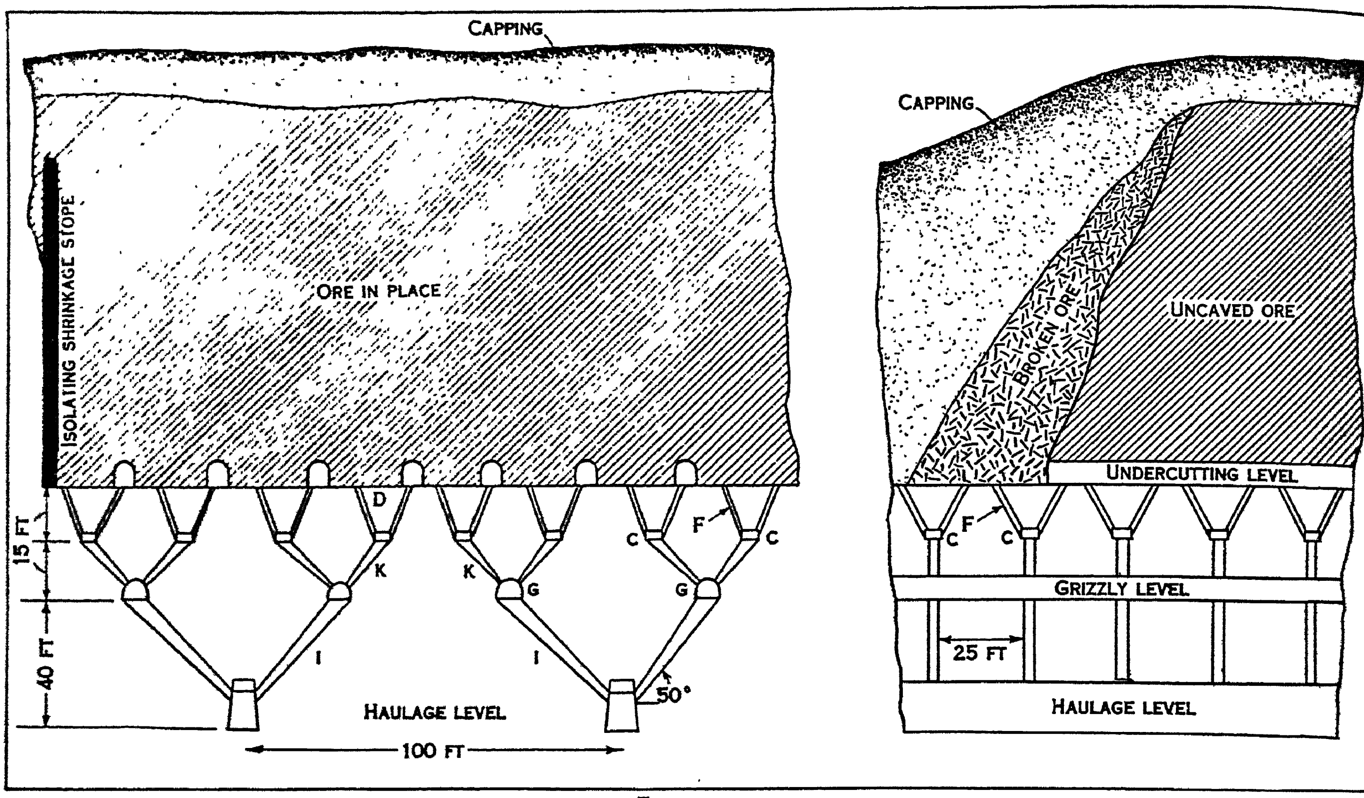
the ore is broken by caving. In some mines where mechanical scrapers are used, cuts are not taken at right angles to the main drifts but at a smaller angle to avoid working the scrapers around corners. The scrapers pull the ore to the chutes. Sub-level caving requires less timbering than top-slicing and the cost of mining is lower. However, the percentage of extraction is not so high and some capping becomes mixed with the ore.

Block-caving.—In this method a block of ore is undercut, and settles the height of the undercut. This relatively small movement of the ore is sufficient to break it into small pieces. Suitable ore bodies should be large, and the ore should be firm enough to stand well during the work of undercutting and yet be brittle enough to break up well during the process of settling. The capping should cave readily. The broken ore is drawn off at the bottom of the block until capping appears. Variations of block-caving are due to the methods of undercutting the ore and drawing off the ore. If *undercut from the main level,* the block is cut by intersecting drifts and cross drifts into a series of pillars, which are as small as safety permits. The pillars are drilled and blasted, and time is allowed for the ore to settle. At the Pewabic iron mine in Michigan, levels are from 100 to 125 ft. apart; the height of undercut is 7 feet. A block requires several weeks to settle, but continues to work for months. It was found that at the end of 6 to 8 months about 80% of the ore was fine enough to pass through a 3 in. ring. The broken ore is mined by driving a series of closely timbered drifts into the broken material. The ore runs in at the ends of the drifts and is shovelled into cars. When waste appears a few sets in the drift are blasted down and drawing is resumed at a new point, thus following a retreating system. If a block is *undercut from sub-level,* the general features are similar to those just described. From the main haulage-level, drifts are turned off at right-angles at say 50 ft. intervals, and are driven to the limits of the block. A sub-level is driven above the main level, and the block is undercut by intersecting drifts and cross drifts on the sub-level. Chutes are put up to the sub-level from the haulage level. The pillars are blasted and the ore is worked into chutes. In *caving into chutes,* the chutes are close together and their tops are widened into funnels. The ore as it caves falls into these funnels.

Block-caving With Branch Raises is a method followed at several large copper mines in the United States and in South America. The method is shown in figs. 10 and 11. From the haulage-level main inclined chutes (also called transfer raises or simply transfers), *i*, are driven to the grizzly level, where drifts, *g*, are used to connect a line of chutes. The tops of the chutes are covered with a grizzly made of rails to catch the large pieces of ore which would choke the chutes. From the grizzly level inclined chutes, *k*, are carried up and terminate in a square set, *C*, called a control set, from which two or four inclined raises, *F*, called "finger raises" are driven to the undercutting level at the bottom of the block. The tops of the finger raises are spaced 12·5 ft. apart each way, thus offering an ample number of points for drawing off the caved ore.

The ore is undercut by running a series of drifts, *D*, 25 ft. apart to the limits of the block. At one end of the block the ends of the drifts are widened. Holes are then drilled in the intervening ribs or pillars and in the back. Blasting these holes generally starts the caving. Isolating shrinkage stopes, called "boundary shrinks," are carried up across the ends or sides of the block before the ore is undercut to separate it from the adjoining ground and thus facilitate the caving. This method is suitable for ore that is soft or of medium hardness in which there is little or no waste. Hard ores which break in large blocks are better suited to shrinkage stoping. The capping should follow down freely after the ore, which should break into small pieces and run well into the chutes. Ores containing much fine material are likely to stick in the chutes, especially if wet. Details of the method vary at different mines. The undercutting level may be inclined to follow the bottom slope of the ore. Finger raises may vary in number from two to four and in slope from 33° to 45° or more. Chutes may have a slope as great as 70°, but vertical chutes tend to choke more easily than inclined ones. The spacing of the series of branch raises along the haulage way may vary from 25 to 100 feet.

The height of ore (called lift) in a block may be from 30 to 240 feet. A thick body of ore may be worked in more than one lift. For a given amount of development work, the higher the lift taken the less is the cost per ton for the development work, since the cost is spread over all the ore in a block. However, other factors such as the horizontal extent of the ore and the economic life of the workings must also be considered. Since the method is applied to low grade copper ores, between 1 and 2% copper,



FIGS. 10 & 11

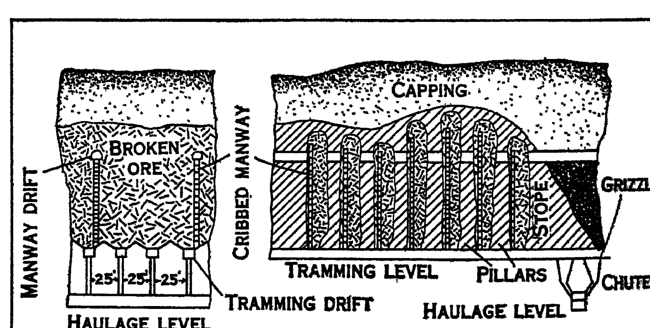
care must be taken to keep the diluting of ore by waste to a minimum. The line of contact between the broken ore and the cappings (*see* fig. 11) is usually between 40° and 70° with the horizontal. The flatter the angle the greater is the amount of broken ore in the stope, and trouble from packing of the ore is increased. The more temporary workings must be kept open a longer time, entailing a heavy expense. At the Ruth mine an angle of 40° resulted in a minimum dilution with capping; at the Inspiration mine an angle greater than 60° caused a tendency of the capping to break through into the chutes.

Results at different mines show a lowering of the estimated grade of the ore by only a small fraction of 1%, under favourable conditions less than 0·1%. The tonnage recovered from a block is generally slightly higher than the calculated volume of the block due to included capping. Some ore is lost. The actual recovery of the copper contents of blocks ranges from 83 to 99%.

COMBINED METHODS

Combined methods may take several forms, but variations of room and pillar mining, a series of alternating narrow stopes and pillars, are most common. The ore is sufficiently hard to permit of using shrinkage stoping in the rooms. The pillars serve to support the capping until the stopes are completed. The pillars are mined in a number of ways; *e.g.*, by top-slicing, sub-level caving or block-caving. In another variation of combined methods the stopes may be square-set stopes, and the pillars are mined by slicing. Figs. 12 and 13 illustrate one system of combined methods. Fig. 12 shows part of a longitudinal vertical cross-section through a stope, taken at right-angles to the plane of fig. 13. Stopes are about 15 ft. wide by 150 to 175 ft. long. Pillars are 10 ft. thick. The tramming level at the bottom of the stopes is a series of drifts 25 ft. apart laid out at right angles to the long axis of the stopes. From 75 to 100 ft. above the tramming level, manway drifts are run at 75 ft. intervals. Raises for manways are put up in the stopes and connect the tramway drifts with the manway drifts, thus affording good ventilation. As the ore is stoped the manways are cribbed to keep them open in the broken ore. Chain ladders are hung in the manways from the manway drifts. After the stopes in a block are completed, the pillars are cut off at the bottom and cave as the ore is drawn through chutes in the sides of the tramming drifts. The ore is trammed by hand to the grizzlies over the main chutes which lead to the haulage-level below. Undercutting the pillars and drawing off the ore is carefully controlled to give a steep line of contact between capping and broken ore. As one pillar is undercut the ore is drawn down to capping some 50 to 75 ft. farther back. Some 80% of the ore is drawn out through the chutes.

In regard to costs only generalized figures can be given. Mitke states that caving with branch raises costs from 37 to 96 cents per ton; combined shrinkage and caving (with one exception) costs from \$0.60 to \$1.00 per ton, and top-slicing due to the large amount of timber required costs from \$1.00 to \$2.50 per ton. To illustrate how conditions must control the choice of a mining method, V. A. Brussolo gives the following factors which determine the method to be followed: (1) safety, (2) size and shape



FIGS. 12 & 13

of ore body, (3) grade of the ore, (4) quantity of waste admixed with the ore, (5) character of rock surrounding the section to be mined, (6) flexibility. Of the ore mined at the Pilares mine during 1927, the percentage secured by different mining methods was as follows: horizontal cut and fill, 58·6%; rill stoping, 15·7%; shrinkage with filling, 14·4%; square-sets, 9·8%. Top-slicing, caving and combined methods account for the remaining 1·5%. (*See also* COAL AND COAL MINING; PROSPECTING; DREDGES AND DREDGING.)

Richardson, "Methods of Support of Hanging on New States, Area Ltd., with Special Reference to Concrete Columns," *Journal Chem. Met. and Min. Soc.* (South Africa, July, 1926); *see* also series of articles on mining methods by C. A. Mitke in the *Eng. and Min. Jour.* (Sept. 10, 1924; Oct. 8; Dec. 10, 24, 1917; March 3, April 7, May 1, 26, 1928); V. A. Brussolo, "Mining Methods at the Pilares Mine," *Min. Congress Jour.* (May, 1928). (R. S. L.)

MINION, a favourite, pet, or spoiled person. "Minion" is chiefly applied in a derogatory sense to the "creatures" of a royal court. In the sense pretty, delicate, dainty, the French form *mignon* or *mignonne* is often used in English. During the 17th century "minion" was the name of a type of cannon with a small bore. In printing, a size of type smaller than brevier and larger than nonpareil; it is also known as 7-point.

MINISTER, an official title both civil and ecclesiastical. The word *minister* as originally used in the Latin Church was a translation of the Greek διάκονος, deacon, and in this sense it is still technically used. *See* MINISTRY, THE CHRISTIAN.

For the civil title of minister *see* the articles MINISTRY and CABINET. For the history and meanings of the word "minister" in diplomacy, *see* DIPLOMACY.

MINISTRY, the office of a minister (*q.v.*) in all its meanings, political and religious, or the body of persons holding such an office and performing its duties; more particularly the body of persons who, in theory the servants at the head of the State, act as the responsible executive over the whole sphere of government. The word "ministry" is also in some cases applied to a particular department of government with its responsible head and permanent officials or staff.

In England, ever since the introduction of monarchical institutions the sovereign has always been surrounded by a select body of confidential advisers to assist the Crown in the government of the country. At no period could a king of England act, according to law, without advice in the public concerns of the kingdom; the institution of the Crown of England and the institution of the privy council (*q.v.*) are coeval. In the earlier stages the king's councillors, as confidential servants of the monarch, were present at every meeting of parliament in order to advise upon matters judicial in the House of Lords; but in the reign of Richard II. the privy council dissolved its judicial connection with the peers and assumed an independent jurisdiction of its own. In the reign of Henry VI. the king's council first assumed the name of privy council, and it was during the minority of this sovereign that a select council gradually emerged from the larger body of the privy council, which ultimately became the modern cabinet. Since the revolution of 1688, and the development of parliamentary government, the privy council has dwindled into comparative insignificance, and the power which it once swayed is now exercised by that unrecognized select committee of the council known as the cabinet (*q.v.*).

At first government by cabinet was as unpopular as it was irregular, and until the formation of the first parliamentary ministry by William III. the ministers of the king occupied no recognized position in the House of Commons; it was, indeed, a moot point whether they were entitled to sit at all in the lower chamber, and they were seldom of one mind in the administration of matters of importance. Before the revolution of 1688 there were ministers, but no ministry in the modern sense of the word; divisions in the cabinet were constantly occurring, and it was no uncommon thing to see ministers opposing one another in parliament upon measures that in modern times would be supported by a united cabinet. As the change from government by prerogative to government by parliament consequent upon the revolution of 1688 developed, and the House of Commons became more and more the centre and force of the State, the advantage of having ministers in the legislature to explain and defend the measures and policy of the executive Government began to be appreciated, and it became absolutely necessary that the advisers of the sovereign, who were responsible for every public act of the Crown, as well as for the general policy they had been called upon to administer, should have seats in both houses of parliament. These changes also introduced the practice and conception of having a leading minister who was to become known as the prime minister (*q.v.*). But political unanimity in the cabinet was not yet recognized as indispensable.

In 1812 an attempt was made to form a ministry consisting of men of opposite political principles, who were invited to accept office, not avowedly as a coalition government, but with an offer to the Whig leaders that their friends should be allowed a majority of one in the cabinet. This offer was declined on the plea that to construct a cabinet on "a system of counteraction was inconsistent with the prosecution of any uniform and beneficial course of policy." From that date it has been an established principle that all cabinets are to be formed on some basis of political union agreed upon by the members when they accept office together. It is now also distinctly understood that the members of a cabinet are jointly and severally responsible for each other's acts, and that any attempt to distinguish between a particular minister and his colleagues in such matters is unconstitutional.

During the 19th century the power of ministers was greatly extended, and their duties became more distinctly marked out. As now interpreted, the leading principles of the British Constitution are the personal irresponsibility of the sovereign, the responsibility of ministers, and the inquisitorial and controlling power of parliament. At the head of affairs is the prime minister, with the more important members of the administration constituting the cabinet. Certain of the subordinate members of the administration are occasionally invited to join the cabinet, while others are never in it.

For further details the articles CABINET, PRIVY COUNCIL, GOVERNMENT DEPARTMENTS, should be consulted, as well as the separate treatment of the more important offices under their own headings, as PRIME MINISTER, LORD HIGH CHANCELLOR, SECRETARY OF STATE; and FOREIGN OFFICE, ADMIRALTY, WAR OFFICE.

The corresponding lists of officers in the United States will be found under the title CABINET, a name which is universally used in that country.

TABLE OF LORD TREASURERS OR FIRST LORDS OF THE TREASURY FROM 1603, AND OF THE PRIME MINISTERS FROM 1721

[For the origin and history of the lord treasurer's office, *see* TREASURY, EXCHEQUER, and LORD HIGH TREASURER. Since the Commonwealth the office of lord treasurer has been executed by a board of commissioners, known as the lords of the Treasury, with the exception of the six lord treasurers whose names are printed in italics. Special rank was given to one of the commissioners as first lord of the Treasury, and from the end of the 17th century it has been customary for the leading minister of the Crown to occupy the office of first lord; in later times, therefore (with the few exceptions noted in the list given below), it has usually been held in conjunction with the premiership. The lord treasurer's commission sometimes enables the first lord to act also as chancellor of the exchequer (*see* Table of Chancellors of the Exchequer). The office of lord high treasurer of Scotland was united with that of England at the Union, and in 1816 the separate Irish Treasury was similarly incorporated.]

1603. Lord Buckhurst, cr. earl of Dorset 1604.
1608. Earl of Salisbury.
1612. Earl of Northampton and others. (Commissioners.)
1614. Earl of Suffolk.
1618. Archbishop Abbot and others. (Commissioners.)
1620. Sir H. Montagu, cr. Viscount Mandeville 1620, afterwards earl of Manchester.
1621. Lord Cranfield, cr. earl of Middlesex 1622.
1624. Sir J. Ley, cr. Lord Ley 1625, and earl of Marlborough 1626.
1628. Lord Weston, cr. earl of Portland 1633.
1635. Archbishop Laud and others. (Commissioners.)
1636. W. Juxon, bishop of London.
1641. Sir E. Littleton and others. (Commissioners.)
1643. Lord Cottington.
1649. Commissioners under the Commonwealth.
1660. Sir E. Hyde, after. earl of Clarendon, and others. (Commissioners.)
1660. *Earl of Southampton.*
1667. Duke of Albemarle and others. (Commissioners.)
1672. *Lord Clifford.*
1673. Viscount Dunblane, cr. earl of Danby 1674, after. duke of Leeds.
1679. Earl of Essex.
1679. Lord Hyde, cr. earl of Rochester 1682.
1684. Lord Godolphin.
1685. *Earl of Rochester.*
1687. Lord Bellasyse.
1689. Viscount Mordant, earl of Monmouth, after. earl of Peterborough.
1690. Viscount Lonsdale.
1690. Lord Godolphin.

1697. C. Montagu, cr. earl of Halifax 1700.
1699. Earl of Tankerville.
1700. Lord Godolphin.
1701. Earl of Carlisle.
1702. *Lord Godolphin*, after. earl of Godolphin.
1710. Earl Poulett.
1711. *Earl of Oxford.*
1714. *Duke of Shrewsbury*.
1714. Earl of Halifax.
1715. Earl of Carlisle.
1715. Sir R. Walpole.
1717. J. Stanhope, after. earl Stanhope.
1718. Earl of Sunderland.
1721. Sir R. Walpole (commonly regarded as the first of the prime ministers).
1742. Earl of Wilmington.
1743. Henry Pelham.
1754. Duke of Newcastle.
1756. Duke of Devonshire.
1757. Duke of Newcastle (W. Pitt and the duke of Newcastle's administration).
1762. Earl of Bute.
1763. George Grenville.
1765. Marquess of Rockingham.
1766. Duke of Grafton (W. Pitt, earl of Chatham, prime minister till 1768).
1770. Lord North.
1782. Marquess of Rockingham.
1782. Earl of Shelburne, after. marquess of Lansdowne.
1783. Duke of Portland (prime minister, Lord North, after. earl of Guilford).
1783. William Pitt.
1801. H. Addington, after. Viscount Sidmouth.
1804. William Pitt.
1806. Lord Grenville.
1807. Duke of Portland.
1809. Spencer Perceval.
1812. Earl of Liverpool.
1827. George Canning.
1827. Viscount Goderich, after. earl of Ripon.
1828. Duke of Wellington.
1830. Earl Grey.
1834. Viscount Melbourne.
1834. Sir R. Peel.
1835. Viscount Melbourne.
1841. Sir R. Peel.
1846. Lord J. Russell, cr. Earl Russell 1861.
1852. Earl of Derby.
1852. Earl of Aberdeen.
1855. Viscount Palmerston.
1858. Earl of Derby.
1859. Viscount Palmerston.
1865. Earl Russell.
1866. Earl of Derby.
1868. Benjamin Disraeli.
1868. W. E. Gladstone.
1874. B. Disraeli, cr. earl of Beaconsfield 1876.
1880. W. E. Gladstone.
1885. Sir Stafford Northcote, cr. earl of Iddesleigh 1885 (prime minister, marquess of Salisbury).
1886. W. E. Gladstone.
1886. Marquess of Salisbury.
1887. W. H. Smith (prime minister, Lord Salisbury).
1891. A. J. Balfour (prime minister, Lord Salisbury).
1892. W. E. Gladstone.
1894. Earl of Rosebery.
1895. A. J. Balfour (prime minister, Lord Salisbury till 1902; after 1902, A. J. Balfour).
1905 Sir H. Campbell-Bannerman.
1908. H. H. Asquith, cr. earl of Oxford and Asquith 1925.
1916. D. Lloyd George.
1922. A. Bonar Law.
1923. Stanley Baldwin.
1924. J. Ramsay MacDonald (from Jan. to Nov.).
1924. Stanley Baldwin.
1929. J. Ramsay MacDonald.

Table of Lord Chancellors (C.) or Lord Keepers (L.K.)

(For the history of these offices *see* under their own headings.)

1603. Sir T. Egerton, L.K., cr. Lord Ellesmere 1603, and Viscount Brackley 1616.
1617. Sir F. Bacon, L.K., cr. Lord Verulam 1618, and Viscount St. Albans 1621.
1621. J. Williams, bishop of Lincoln, L.K.
1625. Sir T. Coventry, L.K., cr. Lord Coventry 1628.
1640. Sir J. Finch, L.K., cr. Lord Finch 1640.
1641. Sir E. Littleton, L.K., cr. Lord Lyttleton 1641.
1645. Sir R. Lane, L.K.
1649. Interregnum.
1660. Sir E. Hyde, C., cr. Lord Hyde 1660, and earl of Clarendon 1661.
1667. Sir O. Bridgeman, L.K.
1672. Earl of Shaftesbury, C.
1673. Sir H. Finch, L.K., cr. Lord Finch 1674, C. 1675, cr. earl of Nottingham 1681.
1682. Sir F. North, L.K., cr. Lord Guilford 1683.
1685. Lord Jeffreys, C.
1690. Sir J. Maynard and others. (Commissioners.)
1690. Sir J. Trevor and others. (Commissioners.)
1693. Sir J. Somers, L.K., C., cr. Lord Somers 1697.
1700. Sir N. Wright, L.K.
1705. W. Cowper, L.K., cr. Lord Cowper 1706, C. 1707.
1710. Sir T. Trevor and others. (Commissioners.)
1710. Sir S. Harcourt, L.K., cr. Lord Harcourt 1711, C. 1713.
1714. Lord Cowper, C.
1718. Sir R. Tracy and others. (Commissioners.)
1718. Lord Parker, C., cr. earl of Macclesfield 1721.
1725. Sir J. Jekyll and others. (Commissioners.)
1725. Lord King, C.
1733. Lord Talbot of Hensol, C.
1737. Lord Hardwicke, C., cr. earl of Hardwicke 1754.
1756. Sir J. Willes and others. (Commissioners.)
1757. Sir R. Henley, the last lord keeper, cr. Lord Henley and C. 1760, and earl of Northington 1764.
1766. Lord Camden.
1770. Charles Yorke.
1770. Sir S. S. Smythe and others. (Commissioners.)
1771. Lord Apsley, succeeded as Earl Bathurst 1775.
1778. Lord Thurlow.
1783 Lord Loughborough and others. (Commissioners.)
1783. Lord Thurlow.
1792. Sir J. Eyre and others. (Commissioners.)
1793. Lord Loughborough, cr. earl of Rosslyn 1801.
1801. Lord Eldon.
1806. Lord Erskine.
1807. Lord Eldon.
1827. Lord Lyndhurst.
1830. Lord Brougham.
1834. Lord Lyndhurst.
1835. Sir C. C. Pepys and others. (Commissioners.)
1836. Lord Cottenham.
1841. Lord Lyndhurst.
1846. Lord Cottenham.
1850. Lord Langdale and others. (Commissioners.)
1850. Lord Truro.
1852. Lord St. Leonards.
1852. Lord Cranworth.
1858. Lord Chelmsford.
1859. Lord Campbell.
1861. Lord Westbury.
1865. Lord Cranworth.
1866. Lord Chelmsford.
1868. Lord Cairns.
1868. Lord Hatherley.
1872. Lord Selborne.
1874. Lord Cairns, cr. Earl Cairns 1878.
1880. Lord Selborne, cr. earl of Selborne 1882.
1885. Lord Halsbury.
1886. Lord Herschell.
1886. Lord Halsbury.
1892. Lord Herschell.
1895. Lord Halsbury, cr. earl of Halsbury 1898.
1905. Lord Loreburn.
1912. Lord Haldane.
1915. Lord Buckmaster.
1916. Lord Finlay.
1919. Lord Birkenhead, cr. earl of Birkenhead 1922.
1922. Lord Cave.
1924. Lord Haldane (from Jan. to Nov.).
1924. Lord Cave.
1928. Lord Hailsham.
1929. Lord Sankey.

Table of Chancellors of the Exchequer

The chancellor of the exchequer, as finance minister of the Crown, is required to be a member of the House of Commons, and is the person named second after the first lord of the Treasury in the patent appointing commissioners for executing the office of lord high treasurer (*see* p. 540, Table of Lord Treasurers). The title dates from the separate existence of the exchequer court, as the king's revenue court, in the reign of Henry III. (*See* Exchequer.) In Scotland the lord high treasurer, who in virtue of his office had a seat in the Scottish parliament, presided over the court of the exchequer, and this court was reserved by the Act of Union. But the judicial functions of the English and the Scottish courts of exchequer were transferred to the high court of justice and the court of session respectively in the early part of the 19th century. The office of chancellor of the exchequer has sometimes been held jointly with that of prime minister and first lord of the Treasury, and is so indicated by an "*" in the list of chancellors from the time of the Scottish Union given below:

1714. Sir R. Onslow.
1715. *Robert Walpole.
1717. *Lord Stanhope.
1718. John Aislabie.
1721. *Robert Walpole
1742. Sam. Sandys.
1743. *Henry Pelham.
1754. Hon. H B. Legge.
1761. Viscount Barrington.
1762. Sir Francis Dashwood, after. Lord le Despencer.
1763. *George Grenville.
1765. William Dowdeswell.
1766. Hon. Charles Townshend.
1767. Lord North.
1770. *Lord North.
1782. Lord John Cavendish.
William Pitt.
1783. Lord John Cavendish.
*William Pitt.
1801. *Henry Addington.
1804. *William Pitt.
1806. Lord Henry Petty.
1807. Spencer Perceval.
1809. *Spencer Perceval.
1812. N. Vansittart, after. Lord Bexley.
1823. F. J. Robinson, after. Viscount Goderich, and earl of Ripon.
1827. *G. Canning.
1827 J. C. Herries.
1828. H. Goulburn.
1830. Viscount Althorp, after. Earl Spencer.
1834. *Sir R. Peel.
1835. T. Spring-Rice, after. Lord Monteagle.
1839. F. T. Baring, after. Sir F.
1841. H. Goulburn.
1846. C. Wood, after. Sir Chas.
1852. B. Disraeli, after. earl of Beaconsfield.
W. E. Gladstone.
1855. Sir G. C. Lewis.
1858. B. Disraeli.
1859 W. E. Gladstone.
1866. B. Disraeli.
1868. G. W. Hunt.
R. Lowe.
1873. *W. E Gladstone.
1874. Sir S. Northcote, after. earl of Iddesleigh.
1880. *W. E. Gladstone.
1882. H. C. E. Childers.
1885. Sir M. Hicks-Beach.
1886. Sir William Harcourt.
Lord Randolph Churchill
1887. G. J. Goschen.
1892. Sir W. Harcourt.
1895. Sir M. Hicks-Beach.
1902. C. T. Ritchie.
J. Austen Chamberlain, after. Sir A.
1905. H. H. Asquith, after. earl of Oxford and Asquith.
1908. D. L. George.
1915. R. McKenna.
1916. A. Bonar Law.
1919. A. Chamberlain.
1921. Sir R. S. Horne.
1922. S. Baldwin.
1923. N. Chamberlain.
1924. P. Snowden.
1924. W. S. Churchill.
1929. P. Snowden.

Table of Secretaries of State

[With the substitution of two secretaries for one, there was, at first, no distinction of departments, each secretary taking whatever work the king saw fit to entrust him with. During the reigns of the first two Stuarts, there was a tendency to entrust one secretary with the correspondence with Protestant states and their allies, and the other with the correspondence with Catholic states. Probably in the reign of Charles II., and certainly as early as 1691, two departments, the Northern and the Southern, were instituted. In 1782 the departments were changed to Home and Foreign; *see* Secretary of State.]

TABLE OF SECRETARIES OF STATE FROM 1603

1603.	Sir R. Cecil, cr. Lord Cecil 1603, Viscount Cranbone 1604, earl of Salisbury 1605.	
1612.	Vacant.	
1614.	Sir R. Winwood.	
1615.	. . . .	Sir T. Lake.
1618.	Sir R. Naunton.	
1619.	. . . .	Sir G. Calvert.
1623.	Sir E. Conway, cr. Lord Conway 1625.	
1625.	. . . .	Sir A. Morton.
1625.	. . . .	Sir J. Coke.
1628.	Viscount Dorchester.	
1632.	Sir F. Windebank.	
1640.	. . . .	Sir H. Vane.
1641.	Sir E. Nicholas.	
1642.	. . . .	Viscount Falkland.
1643.	. . . .	Lord Digby.
1643.	Interregnum.	
1660.	Sir E. Nicholas. . . .	Sir W. Morrice.
1662.	Sir H. Bennet, cr. earl of Arlington 1665.	
1668.	. . . .	Sir J. Trevor.
1672.	. . . .	Henry Coventry.

1830 . . .	Viscount Melbourne	Viscount Palmerston	Viscount Goderich, after. earl of Ripon.
1833 . . .	..	..	E. G. S. Stanley, after. Lord Stanley and earl of Derby.
1834 . . .	Viscount Duncannon, after. earl of Bessborough	..	T. Spring-Rice, after. Lord Monteagle.
1834 . . .	H. Goulburn	Duke of Wellington	Earl of Aberdeen.
1835 . . .	Lord J. Russell	Viscount Palmerston	Lord Glenelg.
1839 . . .	..	..	Marquess of Normanby.
1839 . . .	Marquess of Normanby	..	Lord J. Russell.
1841 . . .	Sir J. Graham, Bart.	Earl of Aberdeen	Lord Stanley, after. earl of Derby.
1845 . . .	..	..	W. E. Gladstone.
1846 . . .	Sir G. Grey	Viscount Palmerston	Earl Grey.
1852 . . .	Spencer H. Walpole	Earl of Malmesbury	Sir J. S. Pakington, after. Lord Hampton.
1852 . . .	Viscount Palmerston	Lord J. Russell	Duke of Newcastle.

TABLE OF FOREIGN SECRETARIES FROM 1853

1853. Earl of Clarendon.
1858. Earl of Malmesbury.
1859. Lord J. Russell, cr. Earl Russell 1861.
1865. Earl of Clarendon.
1866. Lord Stanley, after. 15th earl of Derby.
1868. Earl of Clarendon.

1870. Earl Granville.	1900. Marquess of Lansdowne.
1874. Earl of Derby.	1905. Sir E. Grey, cr. Viscount Grey 1916.
1878. Marquess of Salisbury.	1916. A. J. Balfour, cr. earl of Balfour 1922.
1880. Earl Granville.	1919. Earl Curzon, cr. Marquess Curzon 1921.
1885. Marquess of Salisbury.	1924. J. Ramsay MacDonald.
1886. Earl of Rosebery.	J. Austen Chamberlain, after. Sir A.
1886. Earl of Iddesleigh.	1929. Arthur Henderson.
1887. Marquess of Salisbury.	
1892. Earl of Rosebery.	
1894. Earl of Kimberley.	
1895. Marquess of Salisbury.	

Particulars of the leading ministers in modern times and the events with which their names are associated may be read in the article ENGLISH HISTORY. H. H. Asquith (Earl of Oxford and Asquith), was *home secretary* 1892–95; H. J. (Viscount) Gladstone (1905–10); W. S. Churchill (1910–11); R. McKenna (1911–15); Sir J. Simon (1915–16); H. (Sir Herbert) Samuel (1916); Sir G. (Earl) Cave (1916–19); E. Shortt (1919–22); W. C. (Viscount) Bridgeman (1922–23); A. Henderson (1924); Sir W. Joynson-Hicks (Viscount Brentford) (1924–29); and J. R. Clynes (1929–) occupied the same office. H. (Sir Henry) Campbell-Bannerman was *secretary for war* in 1886 and 1892–95; R. B. (Viscount) Haldane (1905–12). The resignation of Colonel (Major-General) J. E. B. Seely from this office in 1914 led to the prime minister (Asquith) taking it into his own hands from March to August of that year. The *war secretaries* who followed during the war were Earl Kitchener (1914–16); D. Lloyd George (June to December 1916); the Earl of Derby (1916–18); and Viscount Milner (April to December 1918). The *war secretaries* since the war have been W. S. Churchill (1918–21); Sir L. Worthington-Evans (1921–22); the Earl of Derby (1922–24); S. Walsh (1924) and T. Shaw (1929–). At the *Colonial Office*, Sir M. Hicks-Beach (Viscount St. Aldwyn) was secretary 1874–80 and Joseph Chamberlain 1895–1902; among others the office was held by A. Bonar Law and W. H. (Viscount) Long during the World War; J. H. Thomas (1924). In 1926, during the term of L. C. M. S. Amery (1924–29), a Dominions Office was set up and Mr. Amery held both offices until 1929; Lord Passfield (Sidney Webb) succeeded him in both posts. John (Viscount) Morley was *secretary for India* in 1905–10 and was followed by the Earl of Crewe (Marquess of Crewe) during 1910–15; J. A. (Sir Austen) Chamberlain (1915–17); Edwin Samuel Montagu (1917–22); Viscount Peel (1922–24); Lord Olivier (1924); Earl of Birkenhead (1924–28); Viscount Peel (1928–29); and W. Benn (1929–).

MINISTRY, THE CHRISTIAN. The purpose of this article must be to trace the history of the existing Christian ministries, assuming, as with but insignificant exceptions all Christian communities do, that a ministry is necessary for their welfare, and indeed for their existence. Practically, our enquiry must be into the development of local ministries. We cannot consider the authority or the actions of Apostles or prophets except as they shaped the constitution of the primitive churches.

That they did so, is clear. We find St. Paul appointing in the churches which he founded officers named "bishops" or "elders," titles which are synonymous. As his was a spiritual office it was a spiritual authority that he conveyed. In fact, a generation which expected an immediate and sudden return of the Lord, could have no interests that were not spiritual. There was one Christian duty that was pre-eminently spiritual. It was that of reproducing the Last Supper. It was dramatic. The leading Christian took the place of our Lord; he was, whether permanently or for the occasion, the chief of the body of bishops or elders. The rest of them sat at meat with him, while the congregation stood around. The sacred acts were repeated. Before liturgies were thought of, the president uttered an extemporary prayer; he spoke as an inspired prophet. Soon, as part of the same process which led to the use of written Gospels in lieu of reminiscences which were growing faint or came to be at second hand, a fixed form of service was composed. There was no longer the primitive confidence. Soon also, some unknown man of genius changed the actual into a symbolic meal. When those three steps had been taken, the church had advanced far towards its permanent shape. There was no necessity for an exceptional or prophetic ministry, and, in fact, the apostles who claimed to be such in the third generation had come to be regarded with suspicion, and the class soon died out.

Thus the local ministry had the field to itself. We have seen that the celebration of the Eucharist was its characteristic office. On this ground Ignatius calls the bishop the representative of Christ, and the presbyters the representatives of the Apostles. But the whole tendency of Christian thought was monarchical. Perhaps the original churches were collegiate, the authority which came to be vested in the bishop being at first held collectively by the body of presbyters or bishops. But this soon ceased. The government passed into the hands of the bishop, with the body of presbyters as his council. In fact there was an analogy with the mediaeval guilds of western Europe. In them, as they survive in the city of London, the society is divided into two classes, the "court" which governs and the "livery," from which the "court" is elected, but which has itself no powers of administration. So, under the Roman empire, the guild, or *collegium* was divided into the *ordo* which ruled and the *plebs* which obeyed, the whole membership being often called the *populus*. When the Christian societies grew in numbers it was natural that they should avail themselves of the liberty allowed to humble folk of combining in *collegia illicita, i.e.,* unlicensed, rather than illegal, guilds for such purposes as that of a burial club. No doubt other definitely religious ends were served by these organizations, in which the lead was naturally taken by the *ordo*. It is strange that in Latin and its derivative languages the technical term "orders" should have been borrowed from this quite secondary side of the office. In several languages *plebs* has similarly come to mean "parish"; Italian *pieve,* Welsh *plwyf*.

The authority of the ministry has been attributed to a grant from the Christian community, regarded as directly inspired by its Founder, of powers with which He had endowed it as a corporate body, to certain of its members. It has also been regarded as a power over the members of the church which was bestowed by the Founder, first upon His Apostles and subsequently, through them, on a permanent line of successors. In explanation of this was developed the doctrine of Orders as sacramental. In its final form, as held in the Roman communion, there are three distinct sacraments of orders, those of bishop, priest and deacon. The papacy, in spite of its authority, is not regarded as having the same sanction, for it has "no outward and visible sign." A pope is regarded as becoming invested with his office from the moment that he signifies his assent to his election.

But this doctrine, which was to become classical, in the form of a theory of the transmission of authority by the laying on of the bishop's hands, could not be older than the systematic development of Christian thought on the subject of sacraments. St. Ignatius had not asserted more than that the Eucharist of the bishop is more securely authentic than that celebrated by any other; he had not claimed that it, received at his hands or at those of his delegate, is alone valid. And the argument of St. Irenaeus that the test of orthodoxy is the doctrine handed down from the Apostles through the bishops is an appeal to succession in office, not to transmission of office. The successors of St. John, who had learned each from his predecessor, what St. John had taught, were witnesses who could be trusted, especially as the line was still brief and therefore the opportunities of error few.

In any case, the position of the bishop became secure, and he was universally established in the Christian churches. This pre-eminence of the one member of the ministry had the inevitable effect of depressing the others. The presbyters, or priests, remained as the council of the local church under the bishop's presidence. They still sat while others stood at worship, they were consulted by the bishop in all matters of importance, and they had the dignity of a corporate body. To this day, at the ordination of a priest, all members of that order who are present join in laying their hands upon the candidate for admission to their order. This has never been done at the ordination of deacons, upon whom the bishop alone lays hands. The reason is that originally deacons were the personal officers of the bishop,

chosen by him to be his assistants, and were not a corporate body. He was only concerned in their admission to orders. Presbyterate and diaconate were two separate branches of the clerical office, as in England now the professions of solicitor and barrister are distinct within the legal calling, nor was it usual to pass from the one to the other. But election to the episcopate was equally within the reach of both. In fact, a deacon had in early times the better chance, especially if at the time of vacancy he held the office of the bishop's chief deacon, or in later terms of archdeacon. At Rome the deacon usually succeeded.

This deacon was the administrative officer of the diocese. He managed its finance, he supervised the conduct of the minor clergy and the laity. He was better known to the congregation than anyone except the bishop, for he, like the other deacons, gave his whole time to his work, while the presbyters, apart from their duty as the bishop's counsellors, were only occasionally employed when the bishop had need of their services. This is strikingly shown in the consistent use of the title *sacerdos*, till well into the fourth century, for the bishop and for the bishop alone. St. Cyprian never uses it otherwise, and though other writers are not equally uniform in their usage, the word "priest" as we understand it and as it is employed in the Old Testament, normally means both in Greek and Latin none other than the bishop. He was still the regular celebrant, though he would from time to time charge one of the presbyters to execute this office for him; and indeed, as the churches grew larger and places of worship more numerous, these presbyters came regularly to preside at the Eucharist in places to which they were appointed, though that where the bishop himself for the occasion presided was for that day the centre of the local church. With the usual ministration of the Eucharist the deacons were thus more habitually connected than the priest. A deacon must be present to assist; it could even be said that he consecrated the chalice, for it was his duty to pour some of the consecrated wine into each of the flagons from which it was drawn for the communion of the laity. In this way as in many others the deacons were always before the public eye. No instance is known of a bishop, however small his see, who had no deacon. Many bishops had no more than one. The traditional number at Rome was seven, which may be due to the fact that Rome was divided for ecclesiastical as well as civil purposes into fourteen regions, over two of which each deacon may have presided. No doubt the record of the Acts, according to which seven was the number of deacons instituted at Jerusalem had its weight; but it is very doubtful whether deacons, as we know them, owe their origin to the Apostolic decision. Rome is the first church which is known to have had deacons with local authority; Alexandria the first with priests who had "parishes," to use the later term of their own. Perhaps we may trace the definite subordination of deacon to priest, which ended in the former office becoming a mere apprenticeship for the latter, to the idea, which sprang up in the fifth century, of a correspondence between the three orders of the Christian with the three orders of the Jewish. The name "levite" came to be not infrequently used for "deacon." It is more important that the second order of the ministry, in accordance with the same analogy, gained the title of *sacerdos*, the bishop being identified with the Jewish high priest. This must have led to the impression that the chief and characteristic function of the priest (a name which survived in general use) was that of celebrating the Eucharist. In fact, as Christianity spread so widely that it was beyond the power of the bishop to satisfy the need, the ordinary minister of both sacraments came to be not the bishop but the priest.

Passing over the minor orders, which are very ancient but only of archaeological interest, we must turn to the organization of the ministry, the theory of which had come to be that of transmission by laying on of hands. The bishop elect was approved and also consecrated (though the formal distinction between "consecration" to the episcopate and "ordination" to lower grades of the ministry is comparatively late) by neighbouring bishops who assembled at the vacant see on news of the late bishop's death. They admitted him to their own community by a corporate laying on of hands, just as the priest was admitted to his order by a similar act, the significance of which has been made less conspicuous by the lead taken by the bishop in the ordination. In any case, but perhaps wrongly, the validity of the rite, whether it be sacramental or no, has been regarded as dependent on the fact that the bishop's hands have been imposed. In regard to the third order there is no doubt of the historical justification for the bishop's acting alone.

When his staff was duly constituted by ordination, it was inevitable that it should be organized. We have seen the beginnings of local priests and deacons. But general organization could only be arranged after the peace and favour conferred by Constantine the Great. It was his will that the church should be co-extensive with his empire, that all its subjects should be induced—and persuasion before long was changed into compulsion—to become Christian, and that the doctrine throughout the Church should be uniform. Thus there arose a problem of administration, which was solved by making the area of civil administration that of the ecclesiastical diocese; and by constituting metropolitan and patriarchal regions corresponding to higher areas of civil government. As men grew familiar with these arrangements, which survived in principle, and often in detail, the fall of the western empire, they came to attach a certain sacredness to them; to the most important of those arrangements, that which gave unique authority to the patriarchate of Rome, they gave an actually theological significance. And the systematizing genius of an age which worked out scholasticism made the whole scheme of religious thought coherent; it was assumed that all was equally true and equally important.

Towards the end of the middle ages the weakest point in the system came to be the personal life, as contrasted with the official claims, of the clergy. Notorious scandals led men on to dispute the current theory of the ministry; and the religious practices which hitherto had satisfied the public conscience lost their impressiveness. Not to speak of earlier attempts at revolt, when Luther proclaimed his new system it was in fact a contradiction to the old. The clergy, though necessary for religion, were not authoritative; they were simply means towards the end of promoting the spiritual life of the community. Luther revived the mediaeval conception of the monarch as the vicar of God on earth. It was for him to provide religious ministrations for his people, and to compel them to take advantage of the provision. The theory had been worked out by opponents of the papal autocracy, especially in the fourteenth century, and was now to be put in practice. A sufficient justification was found in abuses which Rome, itself notoriously unreformed, refused to correct. The monarch (and the class was construed to include quite insignificant princes of Germany) was therefore bidden by virtue of his God-given *summepiskopat,* as it was called in Prussia till 1918, to correct the Church, and to provide for the continuance of a satisfactory ministry. Of its character the prince was to be judge; in Luther's eyes it was a heinous crime for anyone to officiate as a minister of religion without the prince's sanction. Such was the external authority of the Church; inwardly it was verified by the assurance which Luther and his followers enjoyed that they were in a satisfactory spiritual state. But Lutheranism has laboured under the difficulty of reconciling the two standards, that of loyalty to the society and that of inward feeling. The latter, known as Pietism, has always been suspected as tending to breed insincerity and disloyalty.

The rival school of reformed thought, while agreeing with the Lutheran in such traditional essentials as acceptance of the Bible, the Augustinian theology, and the duty of enforcing conformity to the recognized Church, assigned a higher office to the ministry and the Church. The latter is not under the authority of the state, but is the immediate organ of Christ, and its ministry has authority from Him, not from the monarch. It has also a pattern prescribed in Scripture. As the Old Testament gives direction for civil life, so do the epistles of the New for the organization of the Church. While Luther had been indifferent to systems of church-government, rejecting the opportunity of continuing the historical ministry which the adhesion of several bishops to his cause had given him and satisfied to dispense with any justification for

his ministry save that of its efficiency and the monarch's approval, Calvin framed a doctrine which raised the ministry to the mediaeval level. It had for him Divine authority; and its members formed a corporate body which not only should, in national synods, guide the religious life of nations, but also, when the world was fully reformed, assemble to control the universal faith and morals. But there was one profound change; Calvin taught the parity of ministers. There is but one sacred order; for St. Paul bishop was synonymous with presbyter, and his teaching is binding upon later generations. Authority is vested, not in Pope or bishop, but in representatives chosen out of the one order. First at Geneva, and then in Scotland and the Netherlands on a national scale, this government was established, and buttressed with an elaborate theology, which armed the ministry with formidable powers.

Both these novel systems had their weight in England. But there the Reformation began simply as Catholicism without the Pope, though under Edward VI. there was a swift though brief movement towards the continental pattern. The ancient ministry was retained, and survived even when, after the Marian reaction, England became definitely Protestant. This survival of antiquity had to be justified. Why, it was asked, is the English ministry different from that of the other reformed churches? The answer given, and found satisfactory on the continent, was that the ordination of its ministry is a matter within the power of each national church. The English, in its discretion, had chosen to retain the ancient use. It did not condemn other reformed churches which, of choice or of necessity, had dispensed with bishops. It recognized their ministries, and conversely they did the same, though each had no doubt that it had chosen the better course. This was the line taken by Ken, the future bishop and non-juror, when resident in Holland as chaplain to Mary, who was to be the queen of William III. But such tolerance did not satisfy the keener spirits on any side, and when the English Presbyterians under Elizabeth protested that English orders, because conferred by bishops, were invalid, Bancroft and his followers retorted that it was the orders of their critics that were invalid, because given by presbyters. When such arguments were in use reconciliation was no longer possible.

But, at any rate, both sides in this debate believed that it was Divinely ordered that churches should be national, covering the whole ground and including all citizens. Early in the Reformation period a contrary doctrine had been taught, chiefly, though not exclusively, by Anabaptists. This doctrine was that the little Apostolic churches, each independent of the others and united only in love, were the permanent pattern which Christians were bound to follow. Certain devout people felt drawn together. They associated freely; none might be compelled to join the society, nor might it be forced to admit any to membership. Every such society was complete in itself, and was immediately under Christ. By His authority it chose its minister, or ministers. But the choice, once made, was binding, for it was in the name of Christ, and by His inspiration, that it had been made, and the members must recognize His Will in it. Such was the doctrine in its best and most definite shape. But unhappily there can be no doubt that in many instances the appointment of a minister among Congregationalists has been practically a business agreement in which higher considerations have not lastingly prevailed. Their mode of religious organization has had little vogue outside the peoples of English speech; and in England their chief historical importance is that under Cromwell they frustrated the attempt to set up a Presbyterian church. One effect of this temporary victory was that they reduced the English Presbyterians from an organized society to a number of separate congregations, which were unable to escape the same declension from their original standard in regard to the ministry that had affected their rivals.

It remains to speak of the Methodist ministry. It is often said that John Wesley was driven out of the national church. But Wesley had reached the conviction that the Presbyterians were right as to the parity of ministers; he held that he had as much right to ordain as to administer the Lord's supper. He believed also in the value for practical religion of the society which he had founded, and organized with much skill. For him it was authenticated by its usefulness, and he was resolved to gain for it the loyalty of his adherents, for so he would be assured of their continuance in piety. To this end he ordained ministers first for America and Scotland, and finally for England. He did not realize that this meant separation; but he had inspired so strong a Methodist patriotism that his followers, many of whom had never been churchmen, had little attachment to the Church of England. They therefore continued to appoint ministers after his death in 1791 though they did not practice the laying on of hands till 1836, when they resumed it while carefully stating that it is not essential. Methodists, in all its forms, reject the Presbyterian theory of the transmission of the ministry. The corporate Methodist body claims to have the right of conferring the ministry, and holds that spiritual success verifies the claim.

Three great systems, we have seen, lay stress in different ways on corporate life; the historical, within which the authority of the ministry has been differently explained, the Presbyterian, which claimed to be a reversion to a primitive type which ought never to have been forsaken, and the Methodist, which frankly justifies itself by its success in edification. We have also considered the isolating type, in which the single congregation invested by Christ with His authority, appoints its minister. In none of these systems, widely as they may differ, is there any hesitation in asserting that a Power higher than human is at work. Even where, as with the Friends, the ministry may seem to a superficial observation to be reduced to insignificance because it was, and for the most part, except in the United States, still is voluntary, it is really taken most seriously as a Divine appointment. Not only in practice, but in principle, the Christian ministry is recognized universally as a providential ordinance, necessary for the maintenance of the society and for the sustenance of the spiritual life of its members.

MINISTRY OF FOOD: *see* War Control of Food.

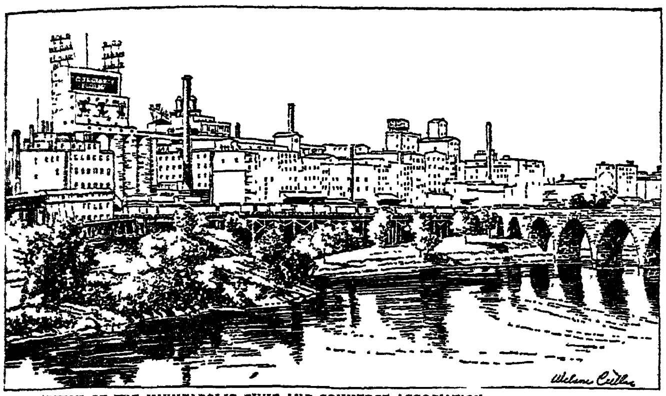
MINK, a name for certain large species of the genus *Putorius* (Polecat), distinguished by slight structural modifications connected with their semi-aquatic habits. The two best-known species, *P. lutreola,* of eastern Europe, and *P. vison,* the mink of North America are very similar. The former inhabits Finland, Poland and the greater part of Russia, west of the Ural Mountains. The latter is found throughout North America. Another form, *P. sibiricus,* from eastern Asia, connects the true minks with the polecats.

In size the mink resembles the English polecat—the length of the head and body being usually from 15 to 18in., that of the tail about 9in. The female is smaller than the male. The tail is bushy, but tapering at the end. The ears are rounded, and scarcely project beyond the fur. The pelage consists of a dense, soft, matted underfur, mixed with long, stiff, lustrous hairs. The gloss is greatest on the upper parts; on the tail the bristly hairs predominate. Northern specimens have the finest pelage. In colour the animal is ordinarily of a rich dark brown, with the back usually the darker and the tail nearly black. There is some white on the jaws, and often irregular white patches on the under parts. The fur is important in commerce.

The principal characteristic of the mink is its amphibious mode of life. It is to the water what the other weasels are to the land, or martens to the trees. It swims and dives with ease. It makes its nest in burrows in the banks of streams, producing five or six young once a year about April. Its food is very varied comprising crustacea, molluscs and members of all the vertebrate classes. It has a very disagreeable smell. (*See* Carnivora.)

MINNEAPOLIS, the largest city of Minnesota, U.S.A., a port of entry, and the county seat of Hennepin county; at the Falls of St. Anthony and the head of navigation on the Mississippi river, 2,160 m. from its mouth, immediately above and west of St. Paul, and exactly midway between the equator and the north pole. It is on Federal highways 10, 12 and 55; has direct airmail

service to Chicago, connecting there with the transcontinental airways, and is served by ten trunk railroad lines (the Burlington Route, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Omaha, the Great Northern, the Minneapolis and St. Louis, the Minneapolis, Northfield and Southern, the Northern Pacific, the Rock Island and the Soo Line) and by electric railways, terminal switching and belt lines, motor coach and truck lines in all directions and river barges. The population was 380,582 in 1920, of whom 88,032 were foreign-born white (largely from northern Europe and Canada), and was 464,356 in 1930, being the 15th city in the United States. The "Twin Cities" and their immediate suburbs constitute a great urban community with a population in 1930 of about 800,000. Minneapolis lies on both sides of the river, on a plateau 800 ft. above sea-level at the Falls and rising to points several hundred feet higher. It covers 58·72 sq.m. and has 22 m. of frontage on the Mississippi, which here averages about 1,200 ft. in width. Nineteen bridges (12 highway and 7 railroad) cross the river within the city limits, and some of them have great structural beauty. Clustered about the Falls, mostly on the west bank of the river, and approached by a long, low bridge of concrete, are the great flour mills, forming a huge mass of limestone masonry, impressive by its bulk and outline. With the addition in recent years of large creameries to the mill district, the silhouette against the western sky has come to be known as "the bread and butter skyline." Minnehaha Creek, the outlet of Lake Minnetonka, flows through the southern part of the city, and just before joining the Mississippi plunges over a cliff 50 ft. high in the falls celebrated by Longfellow (who never saw them, but formed his idea from a photograph) in his poem "Hiawatha." Minnehaha Falls are in one of the city's parks. Adjoining it, in grounds of 51 ac., given to the State by the city, is the State soldiers' home (1887). Just beyond (lying between Minneapolis and St. Paul, at the mouth of the Minnesota river) is the Ft. Snelling Military Reservation (established 1819), where the original fort built in 1822, an ivy-covered round stone tower, stands, with the modern barracks and other buildings of the post, on a high bluff overlooking the gorge of the Mississippi and the valley of the Minnesota. At Ft. Snelling a U.S. Veterans hospital of 560 beds was constructed in 1926–27. There are six large natural lakes and several smaller ones within the city limits. Twelve miles west is Lake Minnetonka, one of the oldest and most famous summer resorts of the North-west, a beautiful body of water 12 m. long, surrounded by wooded hills, with a dozen islands and a shore-line so indented by inlets and points that its length is variously estimated at from 250 to 500 miles. The city owns 131 parks, covering 4,777 ac., of which about 1,000 ac. is outside the city limits. The system embraces a playground or neighbourhood park for every square mile of residential area (and more than an acre to each hundred of the population), 4 public golf courses, 36 athletic fields, 131 tennis courts, 32 skating rinks, 11 lighted hockey rinks and 4 public bath-houses; and 56 m. of boulevards encircling the city, connecting the lakes and the larger parks and passing through beautiful residential districts—called the "Grand Rounds," one section of which is the Victory Memorial Driveway, dedicated in 1921.



BY COURTESY OF THE MINNEAPOLIS CIVIC AND COMMERCE ASSOCIATION

"THE MILLING SKYLINE." THE MISSISSIPPI RIVER WITH FLOUR MILLS IN THE BACKGROUND

Minneapolis has wide streets and many fine public and business buildings. Building permits in the nine years following the World War (1919–27) represented values aggregating $193,524,500. The assessed valuation of property for 1927 was $426,858,182. There are some 150 hotels of all grades, many of them with from 300 to 600 guest-rooms. A magnificent municipal auditorium of granite and Bedford stone (completed in 1927 at a cost exceeding $3,000,000) has an assembly room seating 10,545, a stage 50 by 90 ft., and many ingenious interior arrangements for comfort and convenience The Federal Reserve Bank, designed by Cass Gilbert and completed in 1924, is impressive and unusual. With only one entrance, and lighted entirely from above, it conveys a sense of tremendous strength and security. The Art Institute, designed by McKim, Mead and White (opened 1915) is a beautiful building 575 ft. long by 500 ft. deep. The main campus of the University of Minnesota (*q.v.*) occupies 128 ac. in a bend on the east bank of the Mississippi, entirely within the city of Minneapolis. Its memorial stadium (opened 1924) seats 52,000 spectators. Among the other educational institutions in the city are Augsburg college and Theological Seminary (Norwegian Lutheran, 1869), the Minnesota College of Law, Northwestern College of Law, the William Hood Dunwoody Industrial Institute (an endowed trade school founded in 1914) and the Minneapolis School of Art The public school system includes (1928) 88 elementary, 16 junior and senior high, and several special and vocational schools—a total of 113; and there are 21 parochial schools maintained by the Roman Catholic church. The public library (470,000 volumes, 1928) grew out of a private institution, the Athenaeum. There are 272 churches in the city, representing many faiths and denominations. The hospitals, public and private, have an aggregate of 3,500 beds. The civic and philanthropic agencies of the city, public and private, are affiliated for the purpose of promoting the general welfare in a Council of Social Agencies; and the 65 or 70 organizations among them which are not financed by endowment or from the public treasury or in some special way unite in a joint campaign for funds which raises about $1,100,000 annually. Three general daily newspapers are published in English, one in German, and one in Norwegian and Danish. There are special daily publications devoted to the interests of finance and commerce, the building trades, farming and grain dealers. The city operates under a charter secured in 1872, revised in 1881, and readopted in 1920 with the addition of the numerous amendments made to that date. Under the "home rule" amendment to the State Constitution, new charters representing various plans of government were formulated and presented to the voters in 1900, 1904, 1906 and 1913, but all were rejected. Administrative powers, under the present charter, are vested in a mayor, a council, and several boards (school, library, estimate and taxation and public welfare). Since 1912 the non-partisan system of nomination has been in effect. A city-planning commission was established in 1919, and in 1924 a zoning ordinance was adopted. The water-supply is taken from the Mississippi river, filtered and purified and distributed by a gravity system through 765 m. of mains. With extensions already planned, the plant will have a capacity of 150,000,000 gal. a day, while the average daily consumption at present is about 46,000,000 gallons.

Minneapolis is the principal industrial, commercial and financial centre of the North-west, with an immediate trade territory embracing Minnesota, North and South Dakota, Montana, and the northern part of Nebraska, Iowa, Wisconsin and Michigan. It is the seat of the Ninth Federal Reserve Bank, serving a territory in which there are 2,800 banks. Deposits in the 30 local banking institutions amounted to $344,666,507 on June 30, 1928; and debits to individual accounts aggregated $4,837,608,000 for the year 1928. The 1,200 factories and 1,200 wholesale houses have a total annual business estimated at $1,300,000,000. With the completion of improvements undertaken by the U.S. Government in 1894, navigation of the Mississippi up to the heart of the city was opened on July 3, 1917, when the first steamer passed through the new lock and tied up at the new municipal dock. Since then a

revival of river traffic (for freight) on the Upper Mississippi has set in, and this will be an important supplement to the transport facilities afforded by the ten trunk railways and numerous motor-truck lines which focus at Minneapolis. The terminal yards of the railroads have a capacity of 35,000 freight cars; and 623,790 were received and despatched in 1927. The enormous water-power of the Falls of St. Anthony, of which 60,000 h.p. is utilized, was the original factor determining the development of Minneapolis as a manufacturing centre. The perpendicular fall of the water is about 50 ft. and the rapids below add about 35 ft. In 1868 erosion of the soft limestone ledge threatened to destroy the source of power, but the loss was averted by the construction of a series of dams, a wooden "apron," and a concrete floor (completed 1879) at the joint expense of the U.S. Government and the citizens of Minneapolis. Flour-milling has long been the city's chief industry. The vast lumber industry, developed earlier and for many years equally important, reached its peak in 1899, with an output of 600,000,000 board feet, and then gradually dwindled, as the pine forests were exhausted and replaced by wheat fields, until in 1920 the last saw-mill went out of existence. The flour mills have a daily capacity of 78,800 bbl., and the grain elevators can store 63,433,000 bushels. The total output of the mills in 1927 was 11,540,042 barrels. Minneapolis is still the largest primary wheat market and the largest producer of flour and other grain products in the country, but since the World War reduction of freight rates *via* the Great Lakes has operated to transfer some of the grain trade and milling business to Buffalo and other points in the East. It is one of the world's largest markets for high-grade butter, its own creameries producing annually 7,500,000 lb.; and it is the largest flaxseed market and producer of linseed oil and cake, with mills having a capacity of 16,450,000 bu. of flax, 880,500 bbl. of oil, and 334,000 tons of cake. Other leading manufactures are motor vehicles, bodies and parts; knit goods; foundry and machine-shop products; structural and ornamental iron work. Three of the railroads have extensive construction and repair shops in the city, employing together some 5,000 men. The aggregate factory output in 1927 was valued at $348,416,571. Since the World War the "open shop" has prevailed in most of the trades.

History.—The first European visitor of record to the site of Minneapolis was Father Louis Hennepin, the French Jesuit missionary, who discovered the Falls of St. Anthony and named them for his patron saint. Probably he was preceded by some of the adventurous *coureurs de bois,* few of whom left written records of their travels; and Radisson and Groseilliers seem to have visited the region two decades earlier. The land east of the Mississippi became U.S. territory at the close of the American Revolution, but the west side was under Spanish and then French sovereignty until the purchase of the Louisiana territory in 1803. In 1766 the site was visited by the American traveller, Jonathan Carver; and in 1805 by Lieut. Pike, who bought from the Indians for a military reservation a tract including the greater part of the west side of the city. The fort was built in 1819. In 1822 its commandant set up a lumber mill, and a little later used it to grind flour also, but it was never profitable. In 1838 Franklin Steele built the first claim shanty on the east side of the Mississippi, opposite the Falls; by 1845 there was a population of 200 and the village of St. Anthony was incorporated; in 1848 Steele dammed the east channel of the river above the Falls and erected a group of saw-mills; and in 1852 Richard Rogers built a new and modern flour-mill. Meanwhile, by special act of Congress in 1849, permission was given to two Mexican War veterans to settle on the military reservation west of the river. Squatters followed, until by the time the land was opened to settlement in 1854 there was a population of about 200, who set up a village government in 1855, and named their settlement Minneapolis. There was great rivalry for commercial and industrial leadership between the two settlements. St. Anthony was chartered as a city in 1860; Minneapolis in 1867; in 1870 the population of Minneapolis was 13,066, of St. Anthony, 5,013; and in 1872 they united, under the name of the larger. About 1859 the milling industry began to develop. Farmers hauled their wheat to the St. Anthony mills from as far north as St. Cloud and as far south as Mankato, and camped on the island below the Falls until they could get it ground. The period of great expansion began about 1870, when the lumbering industry had provided an accumulation of capital and the agricultural development of the country was increasing the supply of wheat. The output increased from 200,000 bbl. in 1870 to 2,051,840 in 1880, 6,988,830 in 1890 and 15,982,725 in 1900. The maximum on record was 17,769,280 bbl. in 1914. In 1878 some of the mills were destroyed by a flour-dust explosion, in which 18 employees lost their lives. Pop. in 1880 was 46,887; in 1890 164,738; in 1900 202,718; in 1910 301,408; and in 1920 380,582. Minneapolis, like its neighbour Saint Paul, has a low general death rate, a low infant mortality, little illiteracy, a small proportion of children employed for wages, a high percentage in school, a high percentage of home ownership and an index figure for cost of living below the average for large American cities.

MINNESINGERS, the name given to the German lyric poets of the 12th and 13th centuries. The term *Minnesang,* strictly applicable to the poems expressing the homage (*Minnedienst*) rendered by the knight to his mistress, is applied to the whole body of lyric poetry of the period, whether dealing with love, religion or politics. The idea of *amour courtois,* with its excessive worship of woman, its minute etiquette and its artificial sentiment, was introduced into German poetry from Provençal literature; but the German *Minnesang* was no slavish imitation of the poetry of the troubadours. Its tone was, on the whole, healthier and more sincere. The minnesinger usually belonged to the lower ranks of the nobility, and his verses were addressed to a married woman, often above him in rank. He was not permitted to give his lady's name, or to betray her identity; and a direct expression of passion would also have contravened the rules. The poems were from the first sung in open court to a melody (*Weise*) of the poet's own composing, with the accompaniment of a fiddle or small harp.

The Older Songs.—These consisted of a single strophe cast in three divisions, two (known as *Stollen*) identical in form, stating and developing the argument, the third (*Abgesang*) of different form, giving the conclusion. Later on, two or more strophes were used in a single poem, but the principle of their structure was retained. In this form were cast the *Tagelied,* a dialogue describing the parting of lovers at dawn; and the crusading song. Side by side with these existed the *Spruch,* written in a single undivided stanza, destined for recitation and often cast in the form of a fable. The lay (*Leich*) was written in unequal strophes, each formed of two equal divisions. It was applied in the first instance to sacred lyrics, and was first used in love poems by the Alsatian minnesinger Ulrich von Gutenberg.

The earliest minnesinger whose name has come down to us is von Kürenberg (*fl. c.* 1160), a scion of an Austrian knightly family whose castle lay on the Danube, west of Linz. His songs, however, contradict the root idea of *Minnedienst,* since the lady is the wooer, and the poet, at the most, an acquiescent lover. They take the form of laments for an absent lover, complaints of his faithlessness and the like. Among the other Austrian and south German lyrists who show small trace of foreign influence was Dietmar von Aist (d. *c.* 1171), though some of the songs attributed to him seem to be of later date. While the love-song remained in the hands of noble singers, the *Spruch* was cultivated by humbler poets. The elder of the two or three poets concealed under the name of Spervogel was a wandering singer who found patronage at the court of the burgraves of Regensburg, one of whom himself figures among the earlier minnesingers.

Characteristic Period.—In German *Minnesang* this begins at the close of the 12th century with the establishment of the Provençal tradition in western Germany through the poems of Heinrich von Veldeke and Friedrich von Hausen. National elements abound in Veldeke's songs, although the *amour courtois* dominates the whole; Friedrich von Hausen (d. 1190) followed Provençal models closely, as did also the Swiss Count Rudolf von Fenis. The greatest name among the earlier minnesingers is that of Heinrich von Morungen, a Thuringian poet who lived on in popular story in

the ballad of "The Noble Moringer." He brought great imaginative power to bear on the common subjects of *Minnesang*, and his poetry has a very modern note. The formal art and science of *Minnesang* reached full development in the subtle love-songs of Reinmar, the Alsatian "nightingale of Hagenau." He became a member of the court of Duke Leopold V. (d. 1194) of Austria, and there Walther von der Vogelweide (*q.v.*) was first his disciple, and then perhaps his rival. Walther, the greatest of mediaeval German lyric poets, had Reinmar's technical art, but in feeling was more nearly allied to Morungen. He raised the *Spruch* to the dignity of a serious political poem, which proved a potent weapon against the policy of Innocent III. The *Tagelieder* of Wolfram von Eschenbach give him a high place in *Minnesang*, although his fame, like that of Heinrich von Veldeke and Hartmann von Aue, chiefly rests on his epics. A new style—called by Lachmann *höfische Dorfpoesie*—was developed by Neidhart von Reuental (d. *c.* 1250), who belonged to the lower Bavarian nobility. He wrote songs to accompany the dances of the village beauties, and comic and realistic descriptions of village life to please the court. He was acknowledged by the Meistersinger as one of the 12 masters of song. Nevertheless, with him the decadence may be said to have begun.

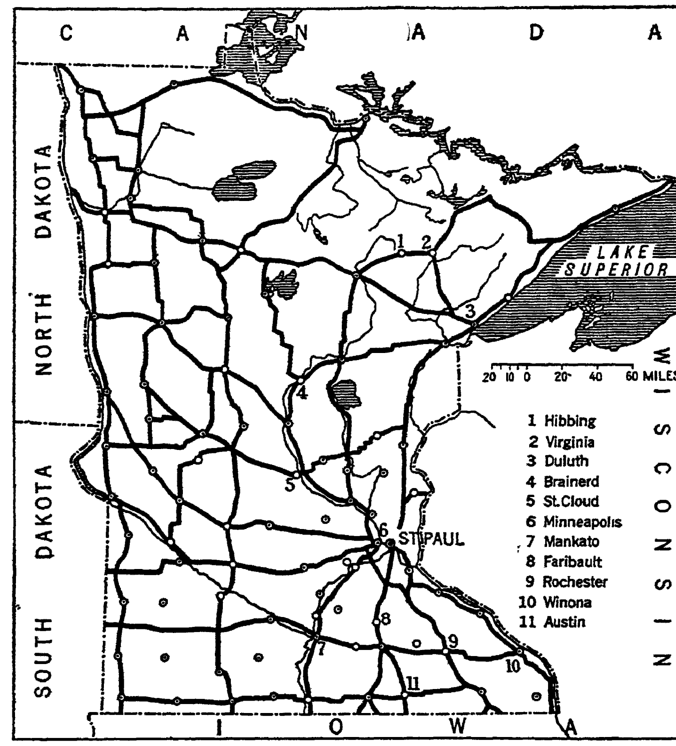
The Styrian poet Ulrich von Lichtenstein (d. *c.* 1275) unconsciously caricatured chivalry itself by his *Frauendienst*, in which he relates the absurd feats which he had undertaken at his lady's command, while Steinmar (*fl. c.* 1276) deliberately parodied court poetry in his praises of rustic beauty and good living. In the lays, songs and proverbs of Tannhäuser something of both elements, of the court and the village, is to be found. The Austrian poet Reinmar von Zweter (d. *c.* 1260) left some hundreds of *Sprüche* political or social in their import. The didactic motive came more and more to the front in the 13th century. The wandering Swabian poet Marner (d. *c.* 1270) cultivated especially the *Spruch*, laughed at the Provençal and courtly tradition, and there is no very great step from his learning and his feuds to the conditions of *Meistergesang*.

BIBLIOGRAPHY.—The chief mss. containing the work of the 300 or more minnesingers whose work has been partially preserved are the old Heidelberg ms. (13th century), the Weingarten-Stuttgart ms. (14th century) and the Great Heidelberg ms. (14th century), formerly known as the Manasse ms. This last is the most comprehensive of all. It has been printed by F. Pfaff (Heidelberg, 1899). The completest collection of the minnesingers' verses is F. H. von der Hagen, *Minnesinger* (4 vols., Leipzig, 1838); K. Lachmann and M. Haupt, *Des Minnesangs Frühling* (ed. F. Vogt, 3rd ed., Leipzig, 1920) is a collection of the minnesingers prior to Walther von der Vogelweide. There is a comprehensive selection of 97 minnesingers by Karl Bartsch, *Deutsche Liederdichter des 12. bis 14. Jahrhunderts* (ed. W. Golther, 7th ed., 1914); *see* also F. Pfaff, *Der Minnesang der 12. bis 14. Jahrhunderts*, pt. i. (Stuttgart, 1892). English translations of early German lyrics are F. C. Nicholson, *Old German Love Songs* (1907). *See* also WALTHER V. D. VOGELWEIDE.

For historical and critical work on the minnesingers, *see* H. Paul, *Grundriss der germanischen Philologie*, vol. ii. (Strasbourg, 2nd ed., 1901), where further references will be found; also A. E. Schönbach, *Die Anfänge des deutschen Minnesanges* (Graz, 1898); F. Grimme, *Geschichte der Minnesänger*, vol. i. (Paderborn, 1892); K. Wechssler, *Das Kulturproblem des Minnesangs*, i. (Halle, 1909).

MINNESOTA, a north-central State of the United States of America. It is bounded north by the Canadian provinces of Manitoba and Ontario, east by Lake Superior and Wisconsin, south by Iowa and west by South and North Dakota. It is the eleventh State in size in the Union, with a total area of 84,682 sq.m., of which 3,824 sq.m. are water surface. It is about 400 m. long (43° 30′ to 49° 24′ N.) and averages 240 m. wide (89° 29′ to 97° 15′ W.). Its name, of Sioux Indian origin, was first applied to the river of that name, and means "cloudy," "turbid," or "invisible" water.

Physical Features.—An extensive water-parting in the north-central part of the State, an elevation whose inclination is almost imperceptible, determines the course of three great continental river systems. From this central elevation the land slopes off in all directions. The highest point in the State, however, is in the Misquah hills north of Lake Superior, where the altitude reaches 2,230 ft.; another high point of 1,960 ft. occurs in the Coteau des Prairies in the south-west; and the Mesabi range, in St. Louis county, rises to an elevation of 1,920 feet. The average elevation is 1,200 feet. Only in the valleys of the Red, Minnesota and Mississippi rivers and along the shore of Lake Superior does the altitude drop below 800 ft., the lowest being 602 feet. The south-



MAP OF MAIN ROADS IN MINNESOTA

ern part of the State was originally open, rolling prairie interspersed with groves of oak and other deciduous timber. A region known as the "Big Woods," composed of broad-leaved, hard-wood trees, extended up the Minnesota valley to the big bend. The northern part, aside from the Red river valley, was one dense coniferous forest, made up largely of white, Norway and jack pine, but containing also some birch, poplar, maple and oak. Outside of certain forest reserves much of the land has been cleared or the best timber cut, though about 15 million acres of Minnesota land —much of it in the rocky eastern area north of Lake Superior—is better suited to forest than to any other use. Of the three river systems mentioned above, the Mississippi—which has its source in Lake Itasca in the north-central part of the State—drains, with its tributaries, approximately the southern two-thirds of the State. Below its junction with the St. Croix, it forms the eastern boundary and is bordered by high bluffs, well-wooded for the most part, but crowned here and there by picturesque limestone cliffs. Its tributaries in this region, the Cannon, Zumbro and Root rivers, also flow through beautiful and fertile, though narrow valleys, considerably below the general level of the prairies. The principal tributaries, however, are the St. Croix and Minnesota rivers. The former forms the Wisconsin boundary for some distance, and is navigable for about 50 m. from its mouth. The latter rises in Big Stone lake on the western boundary and flows, with a great angle to the south, almost entirely across the State, a course of about 450 miles. All these tributaries furnish considerable water-power, as does the Mississippi itself at the Falls of St. Anthony, St. Cloud and Little Falls.

Glacial action not only determined the direction and character of these rivers, but made numerous swamps, and by scouring out rock basins, damming rivers and leaving morainal hollows became responsible for the countless lakes of Minnesota. Doubtless it has many more than any other State in the Union, the number being estimated at over 10,000. The lakes in the south, which occupy glacial moraines for the most part, are generally broad and shal-

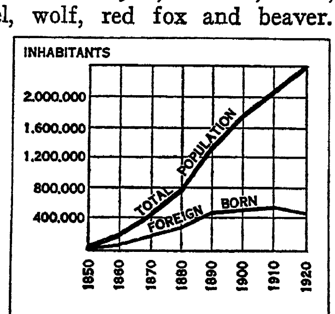
low, while those in the north, formed by glacial basins scoured in solid rock, are generally deep, with ragged, rocky, pine-covered shores. The most interesting feature of the glacial epoch is the extinct Lake Agassiz, which the receding ice of the later glacial period left in the Red river valley of Minnesota, North Dakota and Manitoba. This lake drained southward into the Gulf of Mexico by way of the Minnesota and Mississippi rivers until the ice-sheet that had prevented its natural drainage to the north had melted sufficiently to allow it to be drained off into Hudson bay through the Nelson river. The remarkably level character of the Red river district is due to horizontal deposits in the bottom of this lake, which have been little dissected by river erosion. The largest of the present lakes in this district, Red lake, has an area of 494 square miles. On the northern boundary are the Lake of the Woods (1,485 sq.m.) and Rainy lake (345 sq.m.), draining northward into Hudson bay. The "Park Region" centring in Otter Tail county, contains several thousand lakes. Lake Minnetonka, near Minneapolis, has many bays and islands. There are 22 State parks, 13 of which have areas of over 100 acres. These include Itasca State park (32,000 ac.) about the sources of the Mississippi; Interstate park in Chisago county, and the Minneopa State park, containing Minneopa falls, near Mankato.

Over the greater part of the State the soil consists of surface drift of glacial origin—a dark brown or black sandy loam of great fertility, adapted to cereal crops. In the east-central part of the State the soil is sandy and is devoted largely to potatoes.

Fauna.—The lakes provide excellent fishing. The State game and fish commissioner has charge of a number of hatcheries and field stations which annually help to restock the lakes and streams; in 1926–27 they distributed 520,173,700 young fish. Game birds are abundant. In the lake regions ducks are especially plentiful and more than a million are killed by hunters each year. As a result of short open seasons and the establishment of game refuges, the number of quail, sharp-tailed grouse, upland plover and ring-necked pheasants is increasing. Bear, deer, moose, elk and caribou are the only large game animals.

There is a permanent closed season on all these animals except deer and bear, and only every other season is open for deer, which enjoy a wide range over the northern half of the State. Refuges have been established, and despite the fact that about 22,000 deer are killed in open seasons by sportsmen, their numbers are increasing. The important fur animals are lynx, bobcats, mink, muskrat, skunk, raccoon, weasel, wolf, red fox and beaver.

Climate.—Minnesota has a comparatively low mean annual temperature, but there is great variation, the average annual range for Minneapolis and St. Paul being 119°. The cold increases not only from south to north, but to some degree from east to west. The amount of rain decreases from east to west, varying from nearly 31 in. to less than 25 in. at some points, but in all sections there is enough moisture for humid farming.



GRAPH OF GROWTH OF POPULATION IN MINNESOTA, AND NUMBER OF FOREIGN-BORN, 1850–1920

Population.—In 1920 Minnesota had a population of 2,387,125 and ranked 17th among the States. In 1930 the population was 2,563,953, an increase of 176,828 or 17·4 percent. The state ranked 18th; the density per sq.m. was 31·7 against 29·5 in 1920. Of the 1920 total, 2,368,936 were whites, 8,809 negroes and 8,761 Indians. The negroes increased by 1,725 between 1910–20 and the Indians decreased by 292. The Indians were mostly Chippewa in the northern part of the State. The foreign-born population numbered 486,164; of these 112,117 were from Sweden, 90,188 from Norway, 74,634 from Germany, 33,732 from Canada, 29,108 from Finland and 25,125 from the United Kingdom and Ireland. In recent years many south-eastern Europeans have settled in the northern iron-mining districts. The urban population represented 34·1% of the whole in 1900, and 44·1% in 1920. The following table gives the population and the percentage of increase of cities having more than 20,000 inhabitants in 1930:—

Cities	1930	1920	1920-30 Inc.	1910
Minneapolis . .	464,356	380,582	22·0	301,408
St. Paul . . .	271,606	234,698	15·7	214,744
Duluth . . .	101,463	98,917	2·6	78,466
St. Cloud . . .	21,000	15,873	32·3	10,600
Winona . . .	20,850	19,143	8·9	18,583
Rochester . . .	20,621	13,722	50·3	7,844

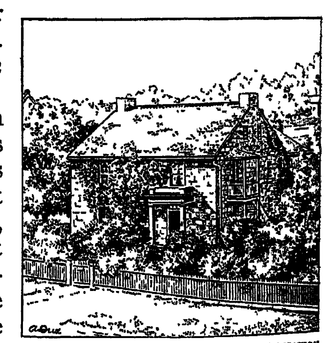
Government is conducted under a Constitution adopted on Oct. 13, 1857, and frequently amended. A proposed amendment must be passed by a majority in both houses of the legislature and be approved by a majority of the votes cast at a general election. The legislature is composed of two houses—the senate and the house of representatives—members of the former being chosen for four years and of the latter for two years. There may be one senator for every 5,000 people, and one representative for every 2,000 people. There has been no reapportionment, however, since 1913. There were, in 1927, 67 senators and 131 representatives. The executive department is made up of a governor, lieutenant governor, secretary of State, treasurer and attorney general, all elected for two years, and an auditor elected for four years. Since 1925 the governor, secretary of State, treasurer, auditor and attorney general together constitute an executive council which unifies the executive policy of the administration.

The governor has a veto which must be exercised within three days after a bill is passed, or it becomes law without his signature. A two-thirds vote of each house is necessary to override the veto. The lieutenant governor presides over the senate and succeeds the governor in case of the latter's death. A Reorganization Act, passed in 1925, combined some of the existing State boards and commissions and created the department of administration and finance. This is administered by a commission of three—comptroller, commissioner of the budget, and commissioner of purchases—appointed by the governor and removable at his pleasure.

The supreme court consists of a chief justice and four associate justices, each elected for a term of six years, and two commissioners who are appointed by the court. The State is divided into 19 judicial districts, each of which has a district court. In most districts one district judge is able to care for all cases. In every county there is a probate court presided over by a probate judge, and justices of the peace and municipal justices handle local cases.

Finance.—Tangible property was valued in 1922 at $8,548,000,000, giving the State a rank of 12th in wealth. This valuation represents an increase over that for 1912 of $3,116,000,000. The per caput wealth in 1922 averaged $3,442.

Taxable property was valued in 1926 at $6,667,617,283 and its assessed valuation in 1927 was $2,403,963,745. On this a direct State tax of 7·70 mills was levied, resulting in $15,011,334 direct taxes. The receipts were apportioned as follows: to the State revenue fund 3·3 mills; to the soldiers' bonus fund 1·50 mills; to the road and bridge fund 1·00 mill; and to the State school tax fund 1·23 mills. An additional tax of $26,695,256 was levied by the counties, $9,533,333 by townships, $40,200,180 by school districts, and $38,558,066 by cities and villages.



BY COURTESY OF THE ST. PAUL ASSOCIATION
SIBLEY HOUSE, WHERE THE FIRST GOVERNOR OF MINNESOTA LIVED

According to a report made by the bureau of the census in 1926, the cost of general government in Minnesota averaged 58 cents per caput, as compared with an average of 75 cents for all the States. Per caput expenditures for the development and conservation of natural resources amounted to $1.20 as compared with a 45 cent average throughout the United States. Per caput expendi-

tures for education amounted to $5.79 as against $3.57, the average in all States.

On Dec. 31, 1927 there were 1,163 banks (281 of them national banks) with total resources and liabilities amounting to $1,162,-417,000, capital and surplus of $96,557,000, and deposits of $890,213,000, of which $517,243,000 were savings deposits. In the general depression during the four years preceding 1926 the banks suffered greatly, there being 70 suspensions in 1926 and 46 in 1927 among State banks.

Education.—General supervision of the State public school system is placed in the State department of education and control of the department is vested in a non-salaried board of education, consisting of five representative citizens appointed by the governor and approved by the senate. The board's powers are exercised through the State commissioner of education, whom it elects.

As soon as the required standards are met the department metes out State aid in a certain fixed proportion. In addition to this fixed aid there is a supplemental aid designed mainly to help the poor school districts. In 1927 there were 400 consolidated schools, and 32,289 pupils were transported to and from them. Other means also were used to improve the rural schools. Only 2,054 rural schools were taught by teachers with first-grade certificates in 1911; in 1928 the number holding first-grade certificates or advanced diplomas was 8,137.

Pupils enrolled in the public school system numbered 440,083 in 1909–10 and 550,330 in 1926–27. Of the latter number 464,461 were in elementary schools, and 85,869 in secondary schools. The number of teachers was 22,099, and they received salaries amounting to $27,698,732. Total expenditures for the public school system of the State have increased from $13,724,000 in 1909–10 to $54,264,674 in 1926–27.

Teachers are trained at the College of Education in the University of Minnesota and at six teachers' colleges, and in high-school normal training departments. The teachers' colleges in 1927–28 had 3,307 students and 225 instructors. There were, in addition to those enrolled in teachers' colleges, 22,646 collegiate students in the State in 1925–26, 1,142 post-graduates and 2,446 professional students. In 1926–27 there were also 63 nurses' training schools in the State with 3,851 students, and in 1924–25, 17 commercial schools with 4,833 students.

Most important of the institutions of higher learning is the University of Minnesota (*q.v.*). Privately supported colleges of liberal arts are Carleton and St. Olaf at Northfield, Gustavus Adolphus at St. Peter; Hamline and Macalester at St. Paul; and St. John's at Collegeville.

Charities and Corrections.—The State board of control, created in 1901, had, in 1926, general control over 18 State charity and corrective institutions, and supervision over 14 county tuberculosis sanatoria. It inspects jails, poorhouses, infirmaries; inspects and licenses maternity hospitals and infant's homes; supervises the administration of mother's pensions; safeguards the interests of illegitimate children; administers the soldiers' welfare fund; appoints county child welfare boards; and acts as a board of parole and discharge for the State Training school for boys and the Home school for girls.

Agriculture and Live Stock.—Minnesota is pre-eminently an agricultural State. In farm value of all crops it ranked fifth among the States in 1924 and 1925, and in 1926, because of unfavourable crop conditions, seventh. In 1926, however, it was first in the production of barley and flax, second in oats and rye, third in spring wheat and potatoes and fifth in corn. These rankings indicate the extent to which crop diversification is practised. The total acreage devoted to all crops was approximately 18,000,-000 and their estimated value for 1926 was $327,008,000, as compared with $372,062,000 for the year 1925 and $421,485,000 for the year 1924. Lower prices and unfavourable weather conditions were responsible for the decrease in value. The acreage and value of the principal crops in 1926 follow: corn, 4,343,000 ac., $82,691,-000; oats, 4,532,000 ac., $43,915,000 (1926 yield exceptionally poor); tame hay, 2,091,000 ac., $38,922,000; potatoes, 298,000 ac., $34,270,000; spring wheat, 1,967,000 ac., $30,243,000; flax, 910,-000 ac., $16,851,000; barley, 1,307,000 ac., $16,664,000; and wild hay, 1,865,000 ac., $15,964,000. The spring wheat acreage is gradually decreasing, while that of flax is rapidly increasing. Apples are the only fruit crop raised commercially to any extent. Live stock marketed in 1926 totalled $166,008,395 as compared with $142,095,045 in 1925. Horses on farms have decreased since 1918; there were 810,000 valued at $62,645,000 on Jan. 1, 1927, as compared with 827,000 head valued at $66,733,000 a year earlier. Minnesota ranked sixth in the number of all cattle on farms on Jan. 1, 1927, there being 2,739,000 head valued at $125,165,000. In 1925 and 1926 sheep-raising made rapid progress, the 670,000 reported Jan. 1, 1927, being a larger number than in any previous year. They were valued at $6,529,000. The wool production has shown a corresponding increase, the 1926 production amounting to 3,392,000 lb., as compared with the 1919–23 average of 2,547,000 pounds. In 1927 swine numbered 3,525,000 with a farm value of $61,688,000. The aggregate gross value of all live stock on farms amounted to $257,119,000 on Jan. 1, 1927. In the five-year period from 1920–25 butter production nearly doubled, increasing from 139,000,000 lb. to 260,000,000 lb. In dairy products generally Minnesota is second only to Wisconsin.

The number of farms in 1927 was 175,139, nearly 3,000 less than in 1920, and the total area of farm land also was somewhat less. The farm population in 1925 was 875,749, or 33·5% of the total population. The average acreage per farm was 159·7; 58·1% of the land area was occupied by farms. The depression in the farm industry after the World War is shown by the decrease in value of all farm property from $3,787,420,000 in 1920 to $2,761,684,000 in 1925. The decrease was mainly in land, for the value of buildings increased. The average value per farm dropped from $21,221 to $14,672, and land from $91.00 per acre to $59.77.

Mining and Lumbering.—From 1919 to 1924 inclusive Minnesota supplied approximately 60% of the entire iron ore production of the nation. In 1927 36,504,854 of the 61,778,000 tons which formed the national output were mined in the State. The value of ore shipped amounted to $90,289,000 in 1927. The ore comes from three distinct districts known as the Vermilion, Mesabi and Cuyuna ranges, named in the order of their discovery and development. All these ranges lie in the northern part of the State, the Vermilion farthest to the east and the Cuyuna farthest to the west (*see* Iron and Mining).

Iron represents about 98% of Minnesota's total mineral output and is the only metal produced. The remainder is made up largely of quarry products. In early years the quarrying of limestone was very important, especially along the bluffs of the Mississippi and its tributaries. As population pushed northward into the granite country and as prosperity began to demand a more permanent building stone, granite assumed greater importance. The value of the stone output in 1923 was $2,412,000.

Minnesota was formerly one of the leading lumber States. In 1899 it held third rank with an output of 2,342,000,000 ft., but careless exploitation has reduced the timber resources. The production of 1919 was but 700,000,000 ft. and by 1925 it had dropped to 579,000,000 feet. In the latter year the State fell to 18th place in lumber production but still held first place in the production of white pine. Wood pulp production is also important, amounting in 1925 to 81,542 tons. In preparation for reforestation the State forestry department was reorganized in 1925. There are two national forests with a combined area of 1,490,000 ac., and two State forests of 21,000 acres.

Manufactures.—In 1925 manufactures were valued at $1,101,-856,000, of which $331,932,000 was added by factory processes. There were 100,614 men employed in manufacturing at wages amounting to $123,767,000. First in importance was the flour and feed-milling industry with an output in 1925 valued at $215,637,-578, exceeding that of any other State. The lumber and flour-milling industries built up Minneapolis, which for many years has been the centre of flour-milling in the United States. It produces about 60% of the mill products of Minnesota. In 1927 there were in Minneapolis 66 elevators with a storage capacity of 63,433,000 bu., greater than that of any other city in the world. Slaughtering and meat-packing was the second manufacturing industry, its output in 1925 amounting to $182,555,429. This industry centres in

South St. Paul. Minnesota's advance as a dairy State was accompanied by an increase in the manufacture of dairy products, an industry third in importance in 1925 with an output valued at $123,456,850. It is widely distributed among the smaller towns. Saw-mill, planing-mill and other timber products amounted in value to $42,289,000 in 1925. Minneapolis in the last decades of the 19th century was the mill centre of the lumber industry, but the last saw-mill there was dismantled in 1921. Next in importance are motor vehicles, $38,761,000; railroad car and repair shops, $35,829,552; and linseed-oil, meal and cake products, $32,933,341. Printing and publishing, bakery products, knit goods, boots and shoes, confectionery and ice-cream contribute greatly to the total. Iron ore is now worked in huge iron and steel plants near Duluth, and farm machinery is manufactured in large quantities.

One of the phenomena of recent years has been the development of electric light and power. Production in kilowatt hours increased from 87,579,000 in 1907 to 1,040,000,000 in 1926.

Transport.—Both by water and by land Minnesota is exceptionally well provided with transport facilities. Duluth stands at the head of the Great Lakes and through its port passes most of the iron-ore and a large share of the grain grown in the Northwest. It also is a receiving port and distributing point for coal and other products for the Northwest. Railways connect with the iron ranges, while others, expanding and intersecting, reach out into the wheat lands of the Dakotas, Montana and western Canada. At the head of navigation on the Mississippi stand Minneapolis and St. Paul. Efforts have been made in recent years, with some success in 1927 and 1928, to develop freighting on the river between Minneapolis and St. Louis, but perhaps the greatest importance of the river is the check it affords against extravagant freight rates by rail. In 1927, 369 buses were operating over 6,211 m. of route, carrying 12,351,612 passengers.

Of the 6,936 m. in the State trunk highway system, 1,327 m. were paved and 4,936 m. were heavily gravelled at the beginning of 1928. Disbursements for this trunk system amounted in 1925 to $17,599,213 and in 1926 to $19,439,209. Building and maintenance of the trunk highways has been financed by motor tax, gasolene tax and Federal aid entirely, and no bonds have been issued. Provision is made for keeping the trunk system open for motor travel all winter. The rural roads have a mileage of 110,929, of which 25,628 m. are surfaced. Expenditures on rural roads of all classes amounted to $30,349,000 in 1926 and $30,702,000 in 1927. Motor vehicles registered in the State numbered 654,350 in 1927, as compared with 332,652 in 1921 and 28,776 in 1912.

History.—The first European visitors to the territory now embraced in the State of Minnesota found it occupied mainly by two Indian tribes, the Ojibway or Chippewa, who lived in the heavily wooded northern portion, and the Dakota or Sioux, who made their homes in the more open country of the South and West. Between the two tribes there was almost continual warfare. The first white men known to have entered the State were Frenchmen. Radisson and Groseilliers may have reached Minnesota territory on an expedition overland from Lake Michigan in 1655. It is more probable that they visited Minnesota on a journey south-west from Lake Superior about 1659. Daniel Greysolon, sieur du Luth (Duluth), is known to have penetrated the territory south-west of Lake Superior in 1679 as far as Mille Lacs, where he set up the standard of Louis XIV. The following year Du Luth crossed via the Bois Brule-St. Croix route to the Mississippi, where he met a party of three Frenchmen led by Michael Accault. They had been sent up the river by La Salle to make the first exploration of the upper Mississippi. Accompanying this expedition was Father Louis Hennepin, who during his wanderings before meeting Du Luth discovered and named the falls of St. Anthony, and who later wrote the first published description of the country. Nicolas Perrot, a trader, ascended the Mississippi in 1686 to Lake Pepin, on the east shore of which he built a fort. Again in 1688 he visited the region, and in 1689 he proclaimed the sovereignty of France over it. In 1695 Le Sueur, who had traded on the upper Mississippi for some years, established a post on Isle Pelée (Prairie island) in the Mississippi between Hastings and Red Wing. In 1700 he ascended the Minnesota river to the mouth of the Blue Earth river at Mankato, whereon he built Fort L'Huillier.

A period of lethargy followed these early explorations, due to the death in 1698 of the energetic governor, Frontenac, who had encouraged them, and the absorption of France in the War of the Spanish Succession (1701–13). All French garrisons in the northwest were withdrawn. Not until Sept. 1727 did another French expedition reach the region. Then the Sieur de la Perrière landed on the west bank of Lake Pepin, built a fort, and the Jesuit fathers who accompanied him established a mission, but both institutions were short lived. In 1731 a party under La Vérendrye explored the chain of lakes along the northern border of Minnesota, and a detachment under his nephew, La Jémeraye, built Fort St. Pierre on the north bank of Rainy Lake. In the next year the main expedition pushed on to the Lake of the Woods, where, within Minnesota borders, they built Fort St. Charles, occupied for 20 years, or longer than any French establishment in the territory. In the treaty of Paris (1763) at the close of the Seven Years War in Europe, the French ceded to England all their possessions east of the Mississippi except the island on which New Orleans is located; those west of that river they had cautiously ceded to Spain in a secret treaty the previous year.

During the period of English and Spanish possession fur-trading operations were carried on by traders of both nations. The only notable explorer to enter the Minnesota country at this time was Jonathan Carver, who was sent out to treat with the Indians, in 1766, by Major Rogers, commandant at Mackinac, and who spent the winter of 1766–67 among the Sioux of the Minnesota valley. In the spring he went down the Minnesota with a large party of Indians and at a cave near the present site of St. Paul, since known by his name, he held a council with the natives. Thence he travelled to Prairie du Chien, where he joined an expedition under Capt. Tute sent out by Rogers to find a route to the "western sea." Carver later published a lively account of his travels, which was widely read in Europe. After the Revolutionary War, the English relinquished their portion of the region (Treaty of Paris, 1783) to the newly formed United States. There was no force to expel the English from the north-west wilderness, however, and the British flag remained flying over the trading-posts of the Northwest Company in Minnesota until after the War of 1812. This company had been formed to organize systematically the fur trade of the north-west. Its headquarters for the region during the last two decades of the 18th century were at Grand Portage, at the east end of the famous portage between Lake Superior and the Pigeon river.

In 1803 the western part of Minnesota was acquired by the United States as part of the Louisiana Purchase. In 1805–06, at the instance of President Thomas Jefferson, Lieut. Zebulon M. Pike led an exploring expedition up the Mississippi as far as Leech lake and Upper Red Cedar or Cass lake. He visited the main posts of the North-west Company and took formal possession for the United States. He also negotiated with the Indians for a tract of land at the confluence of the Minnesota and Mississippi rivers upon which, in 1819, the post later known as Ft. Snelling was established. For many years this remained the most north-western military post in the United States, and it was also the centre of the fur trade in the region. In 1816 the Northwest Company's traders were forced out of Minnesota and their posts were taken over by the American Fur Company, which was soon doing business throughout the upper valley of the Mississippi. In 1818 the jurisdiction of Michigan Territory was extended to the Mississippi river, and its governor, Lewis Cass, in 1820 conducted an expedition to search for the source of the Mississippi, which he was satisfied was in the large body of water named Cass lake in his honour. In 1823 extensive explorations of the Minnesota and Red river valleys were conducted by Major Stephen S. Long, and subsequently knowledge of the Minnesota country was extended by investigations of the region by Henry R. Schoolcraft, who discovered Lake Itasca, the source of the Mississippi, in 1832.

A settlement was attempted in 1812 by Lord Selkirk in Hudson's Bay Company territory in the Red river valley, but failed. A nucleus of settlement also grew up at Mendota, on the Minnesota river opposite, Ft. Snelling, the headquarters of the American

Fur Company. In 1837 two treaties, one with the Chippewa and the other with the Sioux, were negotiated, extinguishing the Indian title to the wedge of land between the Mississippi and St. Croix rivers and opening it to settlement. Following these treaties thriving settlements grew up at St. Paul and Stillwater. In 1849 the bill organizing the Territory of Minnesota was passed by Congress and Alexander Ramsey was appointed governor. The first territorial legislature met at St. Paul on Sept. 3 of the same year. By the Federal census of 1850 the territory had 6,077 inhabitants, most of whom lived east of the Mississippi, or along the Red river in the extreme north-west. Treaties negotiated in 1851 with the Sioux opened to settlement the greater part of the land in the territory west of the Mississippi; and treaties with the Chippewa in 1854 and 1855, negotiated largely in the interests of the lumbermen, extinguished the Indian title to nearly two-thirds of the northern half of the State. Such an unparalleled rush to the new lands took place that a census in 1857 showed a population of 150,037. The lumbering business was booming and building up the towns of Stillwater and St. Anthony (Minneapolis). River steamers to the number of 119 in 1855 and 292 in 1857 landed at St. Paul with settlers and goods, making that city the commercial centre of the territory. Other river towns proved prosperous ports of entry from which settlers trekked to the interior, sometimes individually, sometimes by whole colonies transplanted from Eastern States. In July 1857, a convention met and drew up a State Constitution, which was adopted the following October by an almost unanimous popular vote. On May 11, 1858, the State was admitted to the Union with its present boundaries.

Minnesota furnished nearly 22,000 men for the Federal armies during the Civil War. Even more important to the State than the war in the South was the need for defending her frontier against the uprising of the Indians within her borders. The Sioux felt that they had been deceived and outdone in the treaty of 1851. In 1858 their small reservation was halved and most of the payment went to the traders. Many of the natives resented the Government's attempts to make them farmers. When in the summer of 1862 there was delay in the payment of annuities, bands of the Sioux suddenly began to massacre the settlers in the Minnesota valley. These attacks continued with increasing fury (more than 350 whites losing their lives) until forces under Col. Sibley decisively defeated the Indians under Little Crow, their principal leader, at Wood lake. Three days later 269 white captives were released. Many of the Sioux fled into the Dakota country, but expeditions under Sibley in 1863 and Sully in 1863 and 1864 marched against them and drove them beyond the Missouri.

The coming of peace marked the beginning of a new period of rapid growth, the Federal census of 1870 showing a population of 439,706 or a gain of 155·6% in ten years. During the same decade railway construction, which had begun with a line between St. Paul and St. Anthony in 1862, reached close to 1,000 miles. The period 1870–80 was one of great discontent among the farmers, and one expression of their feeling was their opposition to certain wide-spread abuses of the railroads. A number of regulatory laws, usually called the "granger-acts" because they were sponsored by farmer organizations known as "granges," passed the legislature. Cases arising out of these acts, and carried to the U.S. Supreme Court, which decided against the railroads, had far-reaching results in establishing principles of public regulation of common carriers. The railways themselves suffered severely in the panic of 1873, while the farmers were troubled by severe and repeated grasshopper invasions that destroyed the crops over large areas. Despite these setbacks, Minnesota's population increased 77·6% in the decade from 1870 to 1880; settlements spread over the prairies of the west and south-west, and down the Red river valley. Many of the newcomers were Scandinavian and German immigrants. Wheat became the great crop of the prairies.

In the north the forests were falling under the organized attack of great lumber companies. Agricultural conditions revived, railroads again were being built, and the basis was laid for steady growth in the following decades. In 1884 the mining of iron-ore was begun on the Vermilion range and in 1890 and 1891 the much larger deposits of the Mesabi range were discovered. Railways were built to the mines and by 1900 31 million tons of ore had been taken out. By the end of 1927, 780,323,313 tons had been shipped from the Mesabi and 53,095,923 tons from the Vermilion range. In 1911 shipments began from the Cuyuna range and by 1927 they totalled 25,106,581 tons. Scores of prosperous towns have grown up along the ranges, and the mines have also contributed largely to the prosperity of Duluth.

As wheat began to exhaust the land, the farmers turned more and more to diversified farming and the raising of live stock, and gradually dairying came into prominence. Immediately following the World War agrarian unrest manifested itself first in the Non-Partisan League and later in the Farmer-Labor Party. This party was able to elect two members to the U.S. Senate—one to fill an unexpired term. In 1924, however, the State elections were carried by the Republicans, including one senator.

Bibliography.—For contemporary conditions consult the reports and publications of various State officers, boards and departments, especially the *Biennial Reports* of the treasurer, tax commission, auditor, commissioner of highways, etc.; also the publications of the agricultural experiment station of the University of Minnesota, the *Bulletins* of the State department of agriculture, and State dairy and food department, and *Bulletins* of the experiment station of the University of Minnesota School of Mines (No. 4 being a "Bibliography of Minnesota Mining and Geology," 1915).

The best history of the State is W. W. Folwell, *A History of Minnesota* (St. Paul, 1921–). Valuable also are E. D. Neill, *History of Minnesota* (4th ed., Minneapolis, 1882); and *Minnesota in Three Centuries*, by various authors (1908). For other phases of the State's history and life *see* N. H. Winchell, *The Aborigines of Minnesota* (St. Paul, 1911); D. E. Willard, *The Story of the North Star State* (St. Paul, 1922); W. H. C. Folsom, *Fifty Years in the North-west* (St. Paul, 1888); H. P. Hall, *Observations* (St. Paul, 1904), *Minnesota in the Civil and Indian Wars* (St. Paul, 1890); W. P. Shortridge, *The Transition of a Typical Frontier* (Menasha, 1922); J. G. Pyle, *The Life of James J. Hill* (1917); M. W. Odland, *Life of Knute Nelson* (Minneapolis, 1926); M. L. Hansen, *Old Fort Snelling* (Iowa City, 1918); J. F. Williams, *A History of the City of Saint Paul* (St. Paul, 1876); W. Van Brunt, *Duluth and St. Louis County, Minnesota* (Chicago, 1921); A. N. (S. J. Bu.)

MINNESOTA, UNIVERSITY OF, established under the Territorial Act in 1851 and perpetuated by provisions of the State Constitution, the university of Minnesota began its work of instruction in 1868. By 1928 it had become one of the largest of American universities. The scope of its instruction is exemplified by the fact that during the academic year from Sept. 1926 to June 1927, 12,232 students pursued regular work in such varied subjects as science, literature and arts; engineering and architecture; agriculture, forestry and home economy; law; medicine, nursing and medical technical service; dentistry and dental nursing; mines; pharmacy; chemistry; education; business administration; graduate and special war courses.

The university also conducts a summer session in nearly all of its schools and colleges with a total enrolment of over 5,000 students. It conducts four schools of agriculture of less than college grade, and one teacher-training high school, the enrolment in the five schools being 1,430 during 1926-27. Extension courses having regular class instruction in sciences, arts, business administration and engineering were pursued by 6,318 students, correspondence study courses by 2,184 students, and a wide variety of special short courses by 1,512 students. A total of 1,916 degrees was granted during 1926–27, of which 195 were awarded by the graduate school, 34 of these being the degree of Doctor of Philosophy.

The university carries on an extensive programme including

research and State service. In co-operation with the Federal Government the agricultural experiment station, through an expenditure of $392,000, studies important agricultural problems. The Mayo foundation for research in medicine works in co-operation with the Mayo clinic at Rochester, Minn., upon the most fundamental problems of human diseases. The engineering experiment station also conducts researches. State services of a wide variety are provided by the university in lecture courses, entertainments, reading and study materials, boys' and girls' club work and county agricultural agents. (L. D. C.)

MINNOW (*Phoxinus phoxinus*), a cyprinid fish of Europe and northern Asia, distinguished from the dace and chub by its small scales. A length of 3 or 4 in. is usual, but specimens 7 in. long are known. In America the name is given to other small cyprinids, and to some cyprinodonts. Top minnow is the name given in America to those species of the cyprinodont genus *Fundulus*, which swim at the surface, particularly *F. notatus*.

MINO DI GIOVANNI (1431–1484), called DA FIESOLE, Italian sculptor, was born at Poppi in the Casentino. He had property at Fiesole. Vasari's account of him is very inaccurate. Mino was a friend and fellow-worker with Desiderio da Settignano and Matteo Civitale, all three being about the same age. Mino's sculpture is remarkable for its finish and delicacy of details, as well as for its spirituality and strong devotional feeling. Of Mino's earlier works, the finest are in the duomo of Fiesole, the altarpiece and tomb of Bishop Salutati, executed before 1466. In the Badia of Florence are an altarpiece and the tombs of Bernardo Giugni (1466) and of Count Hugo of Andersburg (1481), all sculptured in white marble, with life-sized recumbent effigies and attendant angels. The pulpit in Prato Cathedral, in which he collaborated with Antonio Rossellino, finished in 1473, is very delicately sculptured with bas-reliefs of great minuteness, but somewhat weakly designed. Soon after the completion of this work Mino went to Rome, where he executed the tomb of Pope Paul II. (now in the crypt of St. Peter's), the tomb of Francesco Tornabuoni in S. Maria sopra Minerva, and a beautiful little marble tabernacle for the holy oils in S. Maria in Trastevere. Some of Mino's portrait busts and profile bas-reliefs are preserved in the Bargello at Florence; at the Berlin Museum and in the collections of Baron Schickler and of Dreyfus in Paris; they are full of life and expression.

See Vasari, Milanesi's ed. (1878–82); Wilhelm Bode, *Die italienische Plastik* (Berlin, 1893); D. Angeli, *Mino da Fiesole* (Florence, 1905).

MINOR, a word used both as an adjective and as a substantive for that which is less than or inferior to another. "Minor Friars," or "Minorites," was the name (*fratres minores*, lesser brothers) given by St. Francis to the order he founded (*see* FRANCISCANS); "minor canons" are clergymen attached to a cathedral or collegiate church, but not members of the chapter, who read and sing the daily service. (For the distinction between holy and minor orders in Christian hierarchy *see* ORDERS.) The name "Minor Prophets" is used collectively of the twelve prophetical books of the Old Testament from Hosea to Malachi inclusive. For the "minor premise" in Logic, *see* SYLLOGISM. In law, a "minor" is a person under legal age (*see* INFANT).

For the "minor of a determinant" in mathematics, *see* DETERMINANT. In astronomy, the term minor planets is given to the members of the solar system which have their orbits between those of Mars and Jupiter (*see* PLANETS, MINOR).

As used in music the term minor is opposed to major as indicating an interval of smaller size, a minor interval containing a semitone less than the corresponding major interval. (*See* MAJOR and HARMONY.)

MINORCA (Menorca), the second in size of the group of Spanish islands in the Mediterranean sea, known as the Balearic islands (*q.v.*), 27 m. E.N.E. of Majorca. Pop. (1920), 42,147; area, 260 sq.m. The coast is deeply indented, especially on the north, with numerous creeks and bays—that of Port Mahon (17,866), being one of the finest in the Mediterranean, if not the best of them all, according to the popular rhyme—

> Junio, Julio, Agosto y Puerto Mahon
> Los mejores puertos del Mediterraneo son—

"June, July, August and Port Mahon are the best harbours of the Mediterranean." (*See* PORT MAHON.) The climate is not so equable as that of Majorca, and the island is exposed in autumn and winter to the violence of the north winds. Its soil is of very unequal quality; that of the higher districts being light, fine, and fertile, and producing regular harvests without much labour, while that of the plains is chalky, scanty, and unfit for pasture or the plough. Some of the valleys have a good alluvial soil; and where the hills have been terraced they are cultivated to the summit. The *Hedysarum coronarium* or *zulla*, as it is called by the Spaniards, is largely cultivated for fodder. Wine, oil, potatoes, hemp and flax are produced in moderate quantities; fruit of all kinds, including melons, pomegranates, figs and almonds, is abundant. Horned cattle, sheep and goats are reared, and small game abound. In the district of Mercadal and in Mt. Santa Agueda are found fine marbles and porphyries; lime and slate are also abundant. Lead, copper and iron might be worked were it not for the scarcity of fuel. There are manufactures of wool, hemp and flax. A road, constructed in 1713–15 by Richard Kane, runs through the island from south-east to north-west, and connects Port Mahon with Ciudadela.

MINORITIES, the protection of racial, linguistic and religious minorities in the sphere of international law. Such protection is not an innovation introduced by the treaties concluded at the end of the World War. Diplomatic history affords several examples of treaties containing special clauses which aim at providing certain guarantees for groups of the population of a different race, language or religion from that of the majority of the population of the State to which they belong. (X.)

HISTORY

The World War has been described as a "War of Nationalities." At any rate, it resulted in the overthrow of four empires, and the creation in Europe of a number of new or greatly enlarged States, which were based on the principle of nationality. This process was imperfectly carried out, partly because its complete application is impossible in a continent where the nationalities are so mixed, and partly because the victors refused in some cases to apply it to their disadvantage. Nevertheless, many of the previous minorities became majorities in the newly organized States, and others were able to coalesce with men of the same nationality already organized in a State. Naturally so great a reversal of conditions has created difficult problems, which can only be understood by a reference to history.

Religious Minorities.—Since no State is comprised of an absolutely homogeneous mass of people of the same race and religion, there have always been "minorities" of one kind or another. In the middle ages there were religious minorities, such as the Albigenses in southern France, which developed an organization of their own, so strong that they were considered specially dangerous and suppressed by the Church by special means. After the Reformation had completely disrupted the religious unity of Europe, religious minorities were present in all States and were treated with great rigour in the majority of them. In some cases the ruler tried to enforce the religion of a minority, but in nearly all cases this failed, and the religion of the majority was adopted as that of the State and that of the minority forbidden. After 1648 the religious position was stabilized and played a less important part and gradually in some countries the idea of toleration of religious belief grew up. But to the end of the 19th century there was always a tendency in some States to deny full religious equality to minority sects.

Nationality.—Meanwhile, minorities of another and even more disruptive kind had been growing up. From the end of the 18th century onwards the idea of nationality, which had long been in existence in western Europe grew immensely stronger and penetrated throughout the Continent. The exact causes of this great increase in national feeling are not exactly known. It can be partially traced to the French Revolution, whose ideas were carried all over Europe by Napoleon's armies but perhaps, the most important cause was the spread of education. Dormant nationalities were awakened or made much more self-conscious by

teachers, who, drawn largely from the middle class, and in revolt against the aristocratic and semi-feudal government, which still persisted in many parts of Europe, used the national feeling as a means of revolt against rulers, who were often of another nationality. The universities, some of which were newly founded, were sometimes the centre of such movements, and the professor was their prophet. The historians, especially, by reviving a knowledge of periods in which the racial minorities had played a great part, had a great effect on their compatriots. Moreover, the change in industry and transport enhanced the efficiency and importance of the State machine. The unit became larger and men no longer thought in terms of their village or county. Their contacts with officials at a distance became more numerous especially after the extension of railways. Both this cause, and the spread of education made language assume a new importance. It was irksome to be governed by men who could not be understood, and impossible to be educated by them.

The growth of democratic ideas made men desire to choose their rulers, and elected assemblies inevitably increased the expression of national feelings. Thus each minority began to demand more and more government by its own nationals, and, where these were organized in another State, to look to that State for help against its own rulers. Side by side with these national aspirations there still persisted religious ties such as those of the Greek or Roman Churches, which were sometimes strong enough to hold the other in check. There were, moreover, racial as distinct from national groups, which helped to unite Slav and Teuton or was at any rate an instrument in the hands of Russia and Germany, the most powerful representatives of each "race."

These forces operating throughout the 19th century were one of the main causes of the formation of the German empire and the unification of Italy, bringing together men of the same nationality, hitherto divided into small units. But the German empire made by the sword of Prussia contained also Danes and Lorrainers incorporated in it by force, as well as the Poles given to Prussia by the Treaty of Vienna (1815). Italy on the other hand, being weak, many Italians were still left under the domination of the Austrian Government. Meanwhile, as a result of national feeling, the Austro-Hungarian empire had grown less united. The German part had been cut off from Germany by Prussia's arms. The Hungarians established an equality with the German-ruled half of the monarchy. In both parts, the Slavs became self-conscious after the revolution of 1848 and struggled to express themselves. The same process had begun even earlier in the Balkan peninsula, where the Christian nationalities, with the assistance of the Great Powers, especially of Russia, threw off the Turkish yoke and gradually obtained autonomy and complete independence, the whole culminating in the Balkan Wars of 1912–13, when they had become strong enough to defeat the Turks themselves. The nationalities along the Russian frontier, also, developed from the same causes, but only two were strong enough to make their cause much known in the rest of the world—the Finns, because of their previous connection with Sweden and semi-independence, and the unquenchable Poles, whose insurrections in 1830 and 1863, though ruthlessly put down, had shown that they were still determined to assert their national rights. In other countries there were also, minorities, which did not accept their position, the most alive being the Irish, whose struggle for Home Rule or semi-independence went on uninterruptedly throughout the 19th century.

In pre-war Europe, therefore, there was a body of people, which has been estimated at about 100 millions, which was discontented with its rulers, and wished to obtain complete independence, or to unite with some other State, or to have some form of autonomy inside their present State. There were the people of Alsace-Lorraine the majority preferring France to Germany, or at least some form of autonomy, and the Danes of Schleswig, as well as the Poles of Posen and Upper Silesia of whom the former could look back to citizenship in a Polish State of fairly recent date, while the latter, though most of them were more recent emigrants, were still conscious of their Polish nationality, which was reinforced by their Catholicism, which contrasted with the Protestantism of the Prussian State.

Austria-Hungary was a mosaic of nationalities. In the Austrian part they had been given much autonomy. The Czechs and Poles of the north and the Slavs of the south had obtained many cultural rights, and played a great part in the government. In the Hungarian part, however, the Magyars since they had won their own rights in 1867 had done their best to deny them to their minorities. The Slovaks and Ruthenes in the north, one with an affinity to the Czechs, and the other to the Ruthenes of Galicia and Russia, were kept down in every way. The Croats and Serbs of the south, and the Rumans of Transylvania were more able to assert themselves after an independent Rumania and Serbia came into existence. But they were denied adequate representation under a pseudo-democratic constitution, and their cultural rights were reduced to the lowest possible minimum. The situation was indeed a difficult one, for islands of Magyars and Germans extended into these lands, and especially in Transylvania, the landlords tended to be of the dominant race. An economic motive was thus added to the other causes of the increase of the national spirit of the minorities, whose combined total was greater than that of the Germans in Austria, or that of the Magyars in Hungary.

In the Balkans, though the Turks were confined to the region round Constantinople the subsequent interference of the Powers and the war between the Balkan States had resulted in large minorities being left under alien rule. Rumania, Serbia and Greece all had Bulgarian subjects. Indeed the mixture of races in Macedonia and other parts was such that minorities were inevitable, though the final arrangement might have been much juster. The creation of Albania had made another national State, but both in its northern frontier with Serbia and its southern with Greece national minorities were necessarily left in all three States.

Meanwhile in the Russian empire the Poles were subjected to worse treatment than in Germany and, of course, much worse than in Austria. The Finns lost many of their old privileges and grew more rebellious in consequence. The peasants of the Baltic provinces of Esths, Letts and Lithuanians were also much affected by the revolution in Russia, a result of the weakness of the Government in the Russo-Japanese War, and there were fierce agrarian outbreaks, later ruthlessly suppressed. In Ireland by 1914 the attempt by the Liberal Government to pass a Home Rule bill against the wishes of the Protestant minority had brought civil war into sight.

The World War.—The war completely reversed this situation. From the outset each side endeavoured to foment the aspirations of the minorities under the control of their enemies. The Germans were at first the most active, and had most success, because of their military victories over Russia. By this means a new Poland was constituted and the Baltic nationalities revived under German control. Attempts were even made to create a Ruthenian revival in South Russia. But the Allied efforts were in the long run more lasting and effective. They were gradually able to reach the minorities of Austria-Hungary, efforts which were facilitated by the co-operation of exiles, who established "Governments" in the Allied countries. The accession of the United States, where President Wilson had already advocated the right of self-determination, added strength to their agitation and money was contributed by their American kinsmen. When therefore, the tide of war turned, the national minorities of Austria-Hungary asserted their right to complete independence, and though, by the secret treaties with Italy and Rumania, the Allies had somewhat violated the principle of nationality, yet they were already pledged to recognize the claims of the Czechs, the Southern Slavs, the Rumanians, the Poles to form new States out of the mosaic.

Thus the Peace treaties were a recognition of the rights which the minorities had claimed, and the new frontier lines of Europe followed more closely than any that had preceded them the ethnographical frontier lines. But, of course, in the intermixture of nationalities it was inevitable that minorities should still exist, and it was perhaps also inevitable that the defeated countries should lose more than a strict interpretation of ethnographical frontiers would have taken from them. Some mitigation was obtained by the institution of plebiscites in Schleswig, Klagenfurt

and in Upper Silesia, where the line of demarcation was later settled by the League of Nations. Nevertheless, both against Germany in the east, against Austria in the south and most of all on all the frontiers of Hungary, lines were drawn, which were in some cases determined by other considerations, and included greater minorities than was necessary in the new States. While such a transfer would in any case have caused great suffering and protest, this has been increased by the arbitrary nature of some of these frontier lines. And since many of the former minorities now rule over those who had previously tyrannized over them, bitter memories tend to make them unjust in their turn. Germany, for example, while accepting to a certain extent the loss of Posen to Poland, has felt deeply the loss of Danzig, the corridor to Poland and the partition of Upper Silesia, though these two last can be defended on ethnographical grounds. The Polish State includes also other nationalities, such as the Ruthenians of Galicia, and the White Russians, which were increased by the occupation of Vilna. The Czechs were allotted all Bohemia and therefore, the two and a half million Germans in it became a minority, while strategic reasons included numbers of Hungarians in Slovakia, as well as the Ruthenes of the Carpathians. Similarly the Rumans obtained not only the inevitable islands of Magyars and Germans in Transylvania, but also a large slice of Hungary proper, though not nearly so much as their secret treaty had promised them. The Italians, also, obtained a large portion of South Tirol, which was almost purely German, while their extension round the Adriatic brought many Slovenes and Serbs under their rule. Thus in one way or another nearly thirty millions of Europeans were still living as "minorities," the majority necessarily so, since they were surrounded by men of other race, but others arbitrarily included as a result of the war.

The situation was naturally much worse in some parts than others. The Germans of Czechoslovakia for example were united by many ties to the Czechs and were soon to take part in the activities of the new State. But the situation is very different as regards the Magyars who are sustained by the unceasing propaganda of their compatriots in Hungary. Even worse is the situation between Hungary and Rumania, where a policy of land expropriation has added bitterness to the struggle. The minorities in Greece and Yugoslavia have been sustained by an active organization, which styles itself "Macedonian," and is only partially connected with Bulgaria. The Germans of the Tirol, in spite of promises made in 1919, have been subjected by the Italian Fascist Government to a régime, which has caused a loud outcry not only in Austria, but also in Germany. Europe still contains, therefore, in its minorities a number of explosive forces of which the future is uncertain, but which obviously need special treatment. How far that has been organized under the League of Nations is described below, but it remains to sketch here such efforts as were made in the 19th century with a similar object and the causes of their failure.

The protection of minorities by the action of an outside power is a very old one. It constantly occurred with regard to religious minorities, Cromwell's action on behalf of the Protestants of Piedmont being a well-known one. But the attempt to protect by international treaty dates only from the settlement of 1814–15; the British Government insisted on clauses being inserted in the treaty which guaranteed, though only in vague terms, the rights of the Poles to special treatment by the Governments of Russia, Austria and Prussia. It was on these clauses that Britain and France founded their protests against Russian action after the insurrections of 1830 and 1863. Moreover, when the new State of the Netherlands was created in 1814, by adding Belgium to Holland, the new king guaranteed, in a document drawn up by the victorious Allies, religious equality and equal commercial opportunity to his new Belgian subjects. It was, however, in the Balkan peninsula, that the principle was to receive its fullest recognition. New States were created out of the Turkish empire by the action of the Powers, who had therefore both the opportunity and the duty to place limits on the sovereign power of the new States, as a condition of their recognition. This policy began in 1830 in connection with Greece and was continued throughout the century. It was again applied to Greece in 1863, and 1881, when additions to its territory were agreed to by the Powers and it was made a cardinal feature of the Treaty of Berlin. Clauses protecting religious minorities were inserted, as a condition of the recognition of Serbia, Montenegro, Bulgaria and Rumania. Turkey herself could not be treated in exactly the same manner, since she was already an established State. But in return for the guarantee of her territory made in 1856 at the Treaty of Paris, the sultan made, expressly as it was said of his own free will, a declaration that he would maintain religious liberty, while in the Treaty of Berlin the Powers took note of a similar declaration.

One of the main causes of these provisions especially as regards Rumania was a desire to protect the Jews. Efforts to obtain for them full civil rights and freedom of religion in Germany by international action had been made as early as the Treaty of Vienna (1815). Jewish communities in France, Britain and, later, in the United States not only influenced their Governments, while the Treaty of Berlin was being made, but established organizations to watch over the execution of the clauses of the treaty, which protected the Jews with the other national minorities.

Nevertheless, it was admitted that this attempt to protect the minorities by treaty was not a success. No machinery was set up to see that the promises of the new States were carried out, and they were often evaded or broken. Protests could be made and were sometimes made by one of the signatories of the treaty, but there was no means of ascertaining the facts and no method by which the Great Powers could act as a body in the name of Europe. Consequently the new governments who resented interference in their domestic concerns by outside Powers found it comparatively easy to defy their sponsors, when they wished to do so. When, therefore, the question arose at the Paris Conference, where again the Jewish community through a special delegation brought their influence to bear on the proceedings, it was only natural that some new method of control should be sought to protect the minorities in the new or greatly enlarged States, which were then being made. Opportunity was found in the permanent machinery of the League of Nations, to whom the supervision of the special treaties on this subject was entrusted. It was, of course, only on new States or on States that had been greatly enlarged as a result of the war that the obligations were imposed. No Great Power would submit to them, and Italy therefore, in spite of her new accessions of territory, is outside this machinery described below.

Bibliography.—The best account of how the present position arose is in *Les Minorités Nationales d'Europe et la Guerre Mondiale*, by Th. Ruyssen (1923), which has a good bibliography. For the history of protection of minorities in the 19th century *see* Iford L. Evans, "The Protection of Minorities," *British Year Book of International Law, 1923–24;* H. W. V. Temperley, *A History of the Peace Conference of Paris*, vol. v. Chapter II. (an authoritative account of the motives of the Powers). A German account is in F. Wertheimer, *Deutschland, die Minderheiten und der Völkerbund* (Berlin, 1926). For the influence of the Jews *see* Max J. Kohler and Simon Wolf, *Jewish Disabilities in the Balkan States* (New York, the American Jewish Committee, 1916) and Lucien Wolf, *Notes in the Diplomatic History of the Jewish Question* (Jewish Historical Society of England, 1919). (C. K. W.)

THE LEAGUE OF NATIONS

In the new system established after the World War, the League of Nations was entrusted with the task of guaranteeing the stipulations concerning the position of minorities. The States established, restored or territorially enlarged by the treaties of peace, as well as Austria, Bulgaria, Hungary and Turkey, accepted certain special obligations concerning the position of racial, linguistic and religious minorities in their territories; these undertakings, which were recognized in general as fundamental laws of the States in question, and as obligations of international concern, were placed under the guarantee of the League of Nations.

It is perhaps well to mention that, in accordance with these provisions, minorities consist—apart from a clause concerning all the *inhabitants* of a country—of those of its *nationals* who belong to a different race or religion, or speak a different language from the majority of the population. The system therefore does not affect either foreigners living in a country the majority of whose population belongs to a different race, religion or language from

their own, or nationals of the country belonging to minorities other than racial, religious or linguistic minorities, such as social or political minorities, etc.

International Instruments.—The international instruments in force in 1928 containing stipulations for the protection of minorities placed under the guarantee of the League of Nations may be classified as follows:

1. Special treaties signed at Paris during the Peace Conference:

(1) Treaty between the Principal Allied and Associated Powers and Poland, signed at Versailles on June 28, 1919;
(2) Treaty between the Principal Allied and Associated Powers and the Kingdom of the Serbs, Croats and Slovenes, signed at St. Germain on Sept. 10, 1919;
(3) Treaty between the Principal Allied and Associated Powers and Czechoslovakia, signed at St. Germain on Sept. 10, 1919;
(4) Treaty between the Principal Allied and Associated Powers and Rumania, signed at Paris on Dec. 9, 1919;
(5) Treaty between the Principal Allied and Associated Powers and Greece, signed at Sèvres on Aug. 10, 1920.

2. Special chapters inserted in the general treaties of peace:

(1) Treaty of Peace with Austria, signed at St. Germain-en-Laye on Sept. 10, 1919 (part iii., section v., articles 62 to 69);
(2) Treaty of Peace with Bulgaria, signed at Neuilly-sur-Seine on Nov. 27, 1919 (part iii., section iv., articles 49 to 57);
(3) Treaty of Peace with Hungary, signed at Trianon on June 4, 1920 (part iii., section vi., articles 54 to 60);
(4) Treaty of Peace with Turkey, signed at Lausanne on July 24, 1923 (part i., section iii., articles 37 to 45).

3. Declarations made before the Council of the League of Nations:

(1) Declaration by Albania, dated Oct. 2, 1921;
(2) Declaration by Estonia, dated Sept. 17, 1923;
(3) Declaration by Finland (in respect of the Åland islands), dated June 27, 1921;
(4) Declaration by Latvia, dated July 7, 1923;
(5) Declaration by Lithuania, dated May 12, 1922.

4. Conventions:

(1) German-Polish Convention on Upper Silesia, dated May 15, 1922 (part iii.);
(2) Convention concerning the Memel Territory, dated May 8, 1924 (Article 11, and Articles 26 and 27 of the Statute annexed to the Convention).

These lists of existing international instruments show the exceptional character of the system of protection of minorities by the League of Nations. The creators of the system had no intention of establishing a general jurisprudence applicable wherever racial, linguistic or religious minorities existed. They simply aimed at facilitating the solution of the problems which might arise from the existence of racial, linguistic or religious minorities in certain countries in which there was reason to suppose that, owing to special circumstances, these problems might present particular difficulties.

It is not enough to ascertain that a more or less considerable proportion of the population of a country belongs to a different race, language or religion to that of the majority in order to deduce the existence of a minority problem which would justify a special system of international protection being set up. The French-speaking population of Switzerland and, even more, the population of the Italian-speaking cantons constitute linguistic minorities, but nobody could maintain that they need international protection. On the other hand, there are genuine minorities in Europe which have not been placed under the protection of the League of Nations, and whose situation, in the opinion of many, constitutes a delicate problem which could have been resolved more easily and rapidly if the League had been able to intervene. The population of the minorities which, in virtue of existing engagements, have been placed under the protection of the League of Nations, may be estimated approximately between 25 and 30 millions. It is extremely difficult to speak of the minorities outside this system of protection, because it is almost impossible to draw a line between the cases where the existence of a minority population raises the problem of international protection and where such a problem does not arise. The existence of these minority groups has led to proposals being made that a general system of minorities protection by the League of Nations should be applied to all States equally, and at different times discussions on this subject have taken place in the League assembly. It must also be kept in mind that a certain number of questions which before the war presented themselves rather in the form of an aspiration towards territorial autonomy are tending now to develop into minorities questions.

These very brief indications, which do not pretend to have included all the European minorities which have remained outside the scope of the League's protection, should, nevertheless, suffice to explain why the notion of a general system of minorities protection by the League of Nations, applicable to all States, is upheld by a large number of persons, and why it should already have been the subject of frequent discussion in the League.

Even while the minorities treaties were being drafted at the Peace Conference, several of the States concerned raised objections. At the plenary meeting of the Conference on May 31, 1919, the representatives of these countries stated that they were prepared to accept obligations regarding the protection of minorities if all the States Members of the League accepted similar obligations. (*See* H. W. V. Temperley, *History of the Peace Conference,* vol. v., p. 129.)

Moreover, the Polish delegation, in a memorandum submitted to the Peace Conference, pointed out that the Treaty of Versailles contained no stipulations concerning the protection of minorities in Germany similar to those which Poland was asked to accept concerning the protection of German minorities in Poland. Germany, in the chapter of her counter-proposals to the peace terms which concerned the League of Nations, demanded the general protection of minorities, and in particular the protection of the German minorities in the territories ceded by her; she declared her willingness to treat minorities in her own territory according to the same principles.

At the meeting of May 31, 1919, M. Clemenceau and President Wilson replied to these objections. Their arguments will be found in Clemenceau's covering letter to Paderewski referred to below. Furthermore, the Allies, on their reply of June 16, 1919, to the German counter-proposals, called attention to the guarantees which would be given by the minorities treaties to the German minorities in the ceded territories, and noted the German delegation's declaration that Germany was prepared to treat minorities in her territory according to the same principles.

The tendency towards the generalization of the system of the protection of minorities became evident once more at the third session of the Assembly of the League of Nations (1922). In the Sixth committee of this Assembly the Latvian representative, Dr. Walters, put forward the idea of a minorities law established on the same basis for all States. The Finnish representative, M. Erich, proposed that the Assembly should ask the Council to set up a commission to study the question of the protection of minorities in general. The Estonian representative supported this proposal, which, however, was subsequently withdrawn. Finally, the Sixth committee submitted to the Assembly a number of resolutions, which the Assembly adopted at its meeting of Sept. 21, 1922. The fourth of these resolutions was as follows:

> The Assembly expresses the hope that the States which are not bound by any legal obligations to the League with respect to minorities will nevertheless observe in the treatment of their own racial, religious or linguistic minorities at least as high a standard of justice and toleration as is required by any of the treaties and by the regular action of the Council.

Three years later, in 1925, at the sixth session of the Assembly (meeting of Sept. 14, 1925), the Lithuanian delegation submitted the following proposal:

> The Lithuanian delegation proposes that the Sixth Assembly of the League should set up a special committee to prepare a draft convention to include all the States Members of the League of Nations and setting forth their common rights and duties in regard to minorities.

This proposal was discussed by the Sixth committee of the Assembly at its meeting of Sept. 16, 1925. The majority of the speakers who took part in the debate were opposed to the Lithuanian view; a few wished to reserve their opinion; and the Rumanian and Polish representatives declared themselves in favour of the proposal in principle. The Lithuanian delegate having finally withdrawn his proposal, the Assembly decided, on Sept. 22, to

inform the Council of the discussion which had taken place in the Sixth committee in this connection. The Council, at its meeting of Dec. 9, 1925, merely took note of the Assembly's resolution.

At the same meeting of the Council, M. de Mello Franco, (Brazil), as rapporteur on minorities questions, stated his personal views, in the course of which he pronounced definitely against generalizing the system for the protection of minorities. In M. de Mello Franco's opinion, "the mere co-existence of groups of persons forming collective entities, racially different, in the territory and under the jurisdiction of a State, is not sufficient to create the obligation to recognize the existence in that State, side by side with the majority of its population, of a minority requiring a protection entrusted to the League of Nations. In order that a minority, according to the meaning of the present treaties, should exist, it must be the product of struggles, going back for centuries, or perhaps for shorter periods, between certain nationalities, and of the transference of certain territories from one sovereignty to another through successive historic phases." As these factors were not constant in all the States Members of the League of Nations, it would not be possible, in M. de Mello Franco's opinion, for all these States to adhere to a general convention such as that proposed by the Lithuanian representative.

THE PROTECTION OF MINORITIES UNDER THE GUARANTEE OF THE LEAGUE OF NATIONS

The Minorities Treaties.—In pursuance of certain clauses in the general treaties of peace, Greece, Poland, Rumania, Czechoslovakia and the Kingdom of the Serbs, Croats and Slovenes agreed to the insertion in special treaties with the principal Allied and Associated Powers of the provisions which these Powers judged necessary to protect the interests of inhabitants differing from the majority of the population of these States in race, language or religion. For Greece, *see* Treaty of Neuilly, article 46; for Poland, Treaty of Versailles, article 93; for Rumania, Czechoslovakia and the Kingdom of the Serbs, Croats and Slovenes, Treaty of St. Germain, articles 60, 57 and 51 respectively. Articles 44 and 47 of the Treaty of Trianon confirm the pledges given to Hungary by the Kingdom of the Serbs, Croats and Slovenes and Rumania respectively.

The drafting of these treaties was entrusted to a commission of the Peace Conference, called the Commission on New States, set up on May 1, 1919. The following countries were represented on this commission: France (M. Berthelot), the United States (Mr. Miller and Mr. Hudson), Great Britain (Mr. Headlam Morley), and later also Italy (M. de Martino and M. Castoldi) and Japan (M. Adatci).

The first treaty prepared by this commission was that concluded with Poland. Its text was transmitted to M. Paderewski, the prime minister of Poland, with a letter from the president of the Conference, M. Clemenceau. This letter may be said to contain the "considerations" which in the Peace Conference's opinion form the basis of all treaties dealing with minorities. The letter first of all lays stress on the fact that the minorities treaties do not inaugurate any fresh departure. It had for a long time, said M. Clemenceau, been the established procedure of the public law of Europe, when a new State was created, or when an existing State absorbed any considerable amount of territory, for the formal recognition of the situation by the Great Powers to be accompanied by a request on the part of these Powers to the Government thus recognized that it should undertake to apply certain definite principles of government in the form of an agreement possessing an international character.

M. Clemenceau went on to point out that the new minorities treaties nevertheless differed in form from previous conventions relating to similar questions. This change of form was a necessary consequence of an essential part of the new system of international relations inaugurated by the establishment of the League of Nations. Formerly the guarantee for provisions of this nature was vested in the Great Powers. Experience had shown that this arrangement was ineffective in practice, and it was also open to the criticism that it might give the Great Powers, either individually or in combination, a right to interfere in the internal constitution of the States affected which could be used for purely political purposes. In the new system the guarantee was entrusted to the League of Nations. Furthermore, added M. Clemenceau, a clause had been inserted in the treaties by virtue of which disputes which might arise in connection with the guarantees in question should be submitted to the Permanent Court of International Justice. In this way the differences which might arise were removed from a political to a juridical sphere—a fact which facilitated an impartial decision.

The stipulations relating to the protection of minorities contained in the special minorities treaties and in the treaties of peace mentioned in category 2 were placed under the guarantee of the League of Nations by special resolutions of the Council of the League. *See* report to the Sixth Assembly on the work of the Council and the secretariat (pages 44 and 45).

Declarations Made Before the Council.—On Dec. 15, 1920, the Assembly, on the fifth committee's proposal, adopted the following resolution:

> In the event of Albania, the Baltic and the Caucasian States being admitted to the League, the Assembly requests that they should take the necessary measures to enforce the principles of the minorities treaties, and that they should arrange with the Council the details required to carry this object into effect.

Of the above States, Albania and Finland were alone admitted during the First Assembly, and questions regarding the minorities in these two countries were considered by the Council at several of its meetings.

As early as June 27, 1921, the Council of the League of Nations, after recognizing the sovereignty of Finland over the Åland islands, adopted a resolution regarding the guarantees which Finland undertook to grant to the population of the Åland islands for the preservation of their language, their culture and their local Swedish traditions. By the terms of this resolution, the Council was to see that the guarantees were duly observed. Finland was to forward to the Council, together with its own observations, any complaints or claims by the Åland landsting on the application of these guarantees, and the Council could consult the Permanent Court of International Justice if the question was of a legal nature.

Finland further submitted to the Council a memorandum conveying detailed information as to the rights guaranteed to minorities in Finland by the constitutional law of that country. The Council noted this information at its meeting of Oct. 2, 1921.

At the same meeting the Albanian representative signed a declaration containing provisions similar to those in the minorities treaties. This declaration was ratified by Albania on Feb. 17, 1922, and placed under the guarantee of the League of Nations.

During the Second Assembly, before the admission of Estonia, Latvia and Lithuania to the League, the representatives of these States signed a declaration by which the Estonian, Latvian and Lithuanian Governments accepted the Assembly resolution of Dec. 15, 1920, and stated their readiness to enter into negotiations with the Council for the purpose of determining the scope and the details of the application of their international obligations for the protection of minorities.

The Council, in Jan. 1922, requested the representative of Brazil to enter into negotiations with the representatives of these States.

On May 12 the representative of Lithuania, M. Sidzikauskas, signed before the Council a declaration containing provisions similar to those in the Polish Minorities Treaty.

Minority questions in Latvia and Estonia have been on the agenda at several meetings of the Council, and the representatives of Estonia and Latvia submitted several memoranda giving the views of their Governments.

At a meeting of the Council on July 7, 1923, the Latvian delegation made a declaration containing proposals which were accepted by the Council and which the Latvian Government subsequently approved on July 29, 1923.

This declaration brought to an end the negotiations between the Latvian Government and the Council with regard to the protection of minorities in Latvia. The Council, however, retains the right to re-open the question if it considers that the position of minorities in Latvia does not correspond to the general principles embodied in the Minorities treaties. The Latvian Government may also

ask that the negotiations be taken up again. The declaration, furthermore, contains stipulations as to the procedure to be adopted for petitions addressed to the League concerning the position of minorities in Latvia. This procedure is similar to that established by the Council for countries that have signed the minorities treaties. The Latvian Government undertakes in principle to give the Council any information that it may require if a question concerning the position of minorities in Latvia is brought before it by one of its members. In case of differences of opinion on questions of law or fact arising out of the declaration, either the Latvian Government or the Council may request that the difference be brought before the Permanent Court of International Justice for an advisory opinion. At its meeting of Sept. 17, 1923, the Council adopted a resolution and accepted proposals contained in a declaration which was enounced by the Estonian representative.

According to this resolution, the Council takes note of the information communicated to it by the Estonian representative in his report of Aug. 28, 1923, concerning the position of racial, linguistic and religious minorities in Estonia. The report states that the protection of minorities in Estonia is at present provided for by the Estonian constitution in a manner conforming to the general principles embodied in the minorities treaties. The Council, however, retains the right to reconsider the position of minorities in Estonia in case the application of the principles of the minorities treaties as laid down in the recommendation of the League Assembly voted on Dec. 15, 1920, should no longer be sufficiently safeguarded. For this purpose the Council may ask the Estonian Government to furnish it with any information it may require as to minorities questions that may be brought before it by one of its members. In case of differences of opinion on questions of law or fact arising out of this resolution, recourse may be had to the Permanent Court of International Justice for an advisory opinion.

The declaration subsequently made by the Estonian representative laid down the procedure to be followed with regard to information addressed to the League on the position of minorities. This procedure corresponds to that already described in the case of Latvia.

The Conventions.—The decision which was adopted on Oct. 20, 1921, by the conference of ambassadors in conformity with the opinion expressed by the Council of the League, lays down as follows:

(1) That the Polish Minorities Treaty of June 28, 1919, is applicable to the Polish portion of Upper Silesia;

(2) That considerations of equity, as well as the maintenance of the economic life of Upper Silesia, require that the German Government should accept similar provisions, at least for a provisional period of 15 years, as regards the German portion of Upper Silesia;

(3) That the provisions of the convention to be concluded between the German and Polish Governments in this connection should constitute obligations of international concern both for Germany and for Poland, and should be placed under the guarantee of the League of Nations in the same manner as those of the treaty of June 28, 1919.

On the basis of this decision, negotiations between Germany and Poland were begun at Beuthen in Dec. 1921, and were resumed at Geneva on Feb. 15, 1922.

The results of these negotiations were embodied in part III. (articles 64–158) of the German-Polish Convention signed at Geneva on May 15, 1922.

The first division of this part of the Convention contains a synoptic table, setting out in one column those articles of the Polish Minorities Treaty which Poland undertakes to apply in the Polish portion of Upper Silesia, and in another column parallel engagements entered into by Germany.

However, in order that the protection of minorities in the plebiscite portions of the territory might be based upon principles of equitable reciprocity, and in order that the special conditions arising out of the provisional régime might receive due consideration, the contracting parties agreed to observe, for a period of 15 years, certain more detailed provisions concerning civil and political rights, religion, private education, public elementary education, vocational training and extension classes, secondary and higher education, the official language of administration and the language to be employed in all legal proceedings of whatever nature.

The Convention also deals with the right of petition and methods of appeal. A minorities office is to be set up in each portion of the plebiscite territory. Persons belonging to a minority may, after having filed a complaint with the highest administrative authority, submit a petition to the minorities office of their State for consideration. If the minorities office does not succeed in obtaining satisfaction for the petitioners, it will transmit the petition, together with any comments it may wish to make, to the president of the Mixed Commission for his opinion. The president will give the members of the Mixed Commission an opportunity to express their views. (The Mixed Commission is composed of two Germans and two Poles, with a president of some other nationality.)

The president will then make known his opinion to the minorities office, which will communicate it to the proper administrative authorities. In case the petitioners are not satisfied with the findings of the administrative authority, they may appeal to the Council of the League of Nations.

Such appeals must be addressed to the minorities office, which will see that they are forwarded to the Council by the Government.

The Council is also competent to give a decision concerning any individual or collective petition addressed to it directly by persons belonging to a minority.

The Convention concerning the Memel Territory contains only two provisions relating to the protection of minorities. The first (article 11 of the Convention and article 26 of the statute annexed to it) stipulates that the Lithuanian declaration of May 12, 1922, applies to minorities within the Memel Territory, with the exception of paragraph 4 of article 4, relating to the use of the minority languages in the law courts. This exception is due to the fact that, in accordance with the second stipulation (article 27 of the statute) the Lithuanian and the German languages are recognized on the same footing as official languages in the Memel Territory.

Certain States have concluded special conventions concerning the position of their respective minorities, but these have not been placed under the guarantee of the League of Nations, *e.g.*, the Treaty of Brünn between Austria and Czechoslovakia, dated June 7, 1920; the Treaty of April 23, 1925, between Poland and Czechoslovakia, etc. Mention may also be made of article 33 of the Convention of Nov. 9, 1920, between Poland and the Free City of Danzig, under which Danzig undertakes to apply to minorities provisions similar to those which are applied by Poland in execution of the Polish Minorities Treaty. The Agreement of Oct. 24, 1921, between Danzig and Poland, in execution of the Convention of Nov. 9, 1920, deals in articles 225 and 226 with the question of language, and in article 227 and annex with the question of education in connection with the Polish minority at Danzig.

THE RIGHTS AND DUTIES OF MINORITIES

Various treaties guaranteed to racial, linguistic or religious minorities certain rights, which may be grouped under the following headings; (*a*) a number of general rights more or less common to all minorities in countries which have accepted the system of the protection of minorities by the League; (*b*) certain special rights guaranteed to minorities situated in more or less exceptional circumstances.

GENERAL RIGHTS

Right to Nationality.—The various minorities treaties contain special provisions with regard to changes in nationality as a result of territorial redistribution[1]. The principle contained in these provisions is that the nationality of a newly-created or enlarged country may be acquired: (*a*) by the fact that a person was habitually resident in the transferred territory, or had rights of citizenship (or "pertinenza") there at the time of the coming

[1]Articles of the Treaties of Peace with Austria, Bulgaria, Hungary and Turkey which refer to nationality had not been placed under the guarantee of the League until 1929.

into force of the treaty[1], and (*b*) by the fact that a person was born in the territory of parents habitually resident there, even though at the date of the coming into force of the treaty the persons concerned were not themselves habitually resident in the territory[2].

The various treaties also lay down that all persons born in the territory of one of these States and not born nationals of another State shall *ipso facto* become nationals of such State.

Finally, the minorities treaties contain certain provisions with regard to the right of option. Persons over 18 years of age who, as a result of territorial changes and the operation of provisions regarding nationality, became nationals of one of the new or territorially enlarged States, were allowed to opt for any other nationality which was open to them. The period fixed in the minorities and peace treaties for the exercise of this right of option was two years as from the date of the coming into force of these treaties. Persons who exercised this right were, within the succeeding twelve months after option, to leave the territory of the State whose nationality they had lost. The treaties authorized them to retain their immovable property in the territory of the State which they had left and to carry with them their movable property of every description, no export duties being imposed upon them in connection with the removal of such property. The minorities treaties contain a special clause under which the States concerned undertake to place no hindrance of any sort in the way of exercise of this right of option.

Life, Personal Liberty and Freedom of Worship.—Under the minorities treaties, the various States undertake to assure to all their inhabitants full and complete protection of life and liberty; they recognize that their inhabitants shall be entitled to the free exercise, whether public or private, of any creed, religion or belief whose practices are not inconsistent with public order or public morals.

These rights therefore have been established not merely on behalf of citizens belonging to a minority, but for the benefit of all the inhabitants of the country. Nevertheless, as will be explained later, the League's guarantee applies only in the case of persons belonging to racial, linguistic or religious minorities.

Equal Treatment.—The various minorities treaties embody the following general principles: (*a*) equality of all nationals of the same country before the law, (*b*) equality in the matter of civil and political rights, and (*c*) equality of treatment and security in law and in fact.

In the arguments in support of its Advisory Opinion No. 6 with regard to the question of settlers of German origin in Poland, the Permanent Court of International Justice interpreted these provisions on equality as follows: "The facts that no racial discrimination appears in the text of the law of July 14, 1920, and that in a few instances the law applies to non-German Polish nationals who took over property as purchasers from original holders of German race, make no substantial difference. . . . There must be equality in fact as well as ostensible legal equality in the sense of the absence of discrimination in the words of the law."

The treaties also lay down that differences of race, language or religion shall not prejudice any national of the country in the matter of admission to public employments, functions and honours or the exercise of professions and industries; that nationals belonging to minorities shall have an equal right to establish, manage and control at their own expense charitable, religious and social institutions, schools and other educational establishments, with the right to use their own language, and to exercise their religion freely therein.

[1]In the case of Poland, the Serb-Croat-Slovene Kingdom and Czechoslovakia, this provision must be interpreted in conjunction with certain provisions of the Treaties of Versailles (article 91, § 2), of St. Germain (article 76), and Trianon (article 62), according to which persons who established their place of residence or acquired rights of citizenship in various circumstances subsequent to a certain date (Jan. 1, 1908 in the case of Poland, and Jan. 1, 1910, in the case of the Kingdom of the Serbs, Croats and Slovenes and Czechoslovakia) do not acquire the nationality of these States without an authorisation from the latter.

[2]In its Advisory Opinion, Number 7, of Sept. 15, 1923, the Permanent Court of International Justice interpreted this provision, with regard to the Polish Treaty, as referring only to the habitual residence of the parents at the date of birth of the persons concerned.

The Use of the Minority Language.—These rights as defined in the treaties take the form of three obligations accepted by the States concerned, namely:

(*a*) The obligation to impose no restriction on the free use by any national of any language in private intercourse, in commerce, in religion, in the press or in publications of any kind, or at public meetings.

(*b*) The obligation to grant nationals speaking a language other than the official language adequate facilities for the use of their language, either orally or in writing before the courts.

(*c*) The obligation to grant adequate facilities in towns and districts where there is a considerable proportion of nationals speaking a language other than the official language of the State, to ensure that in the primary schools[1] the instruction shall be given to the children of such nationals through the medium of their own language.

This provision does not, however, prevent the Government from making the teaching of the official language obligatory in these schools.

Public Funds.—The treaties also lay down that in towns and districts where there is a considerable proportion of nationals of the country belonging to racial, religious or linguistic minorities, these minorities shall be assured an equitable share in the enjoyment and application of the sums which may be provided out of public funds under the State, municipal or other budget, for educational, religious or charitable purposes.

SPECIAL RIGHTS

Jewish Minorities. (a) *Greece.*—In towns and districts where there is a considerable proportion of Greek nationals of the Jewish religion the Government undertakes to respect their Sabbath. This provision does not, however, exempt Jews from such obligations as shall be imposed upon all other Greek nationals for the necessary purposes of military service, national defence or the preservation of public order (article 10 of the Greek Minorities Treaty).

(b) *Lithuania and Poland.*—The Lithuanian Declaration (article 7) and the Polish Treaty (article 10) provide for the constitution of educational committees appointed by the Jewish communities with a view to providing under the general control of the State for the distribution of the proportional share of public funds allocated to Jewish schools and for the organization and management of these schools. Respect for the Sabbath is also stipulated. It is also laid down that no election shall be held on a Saturday. This provision, however, does not exempt Jews from such obligations as shall be imposed upon all other nationals for the necessary purposes of military service, national defence or the preservation of public order. (Article 8 of the Lithuanian Declaration and article 11 of the Polish Treaty.)

(c) *Rumania* recognizes as Rumanian nationals *ipso facto* and without the requirement of any formality Jews inhabiting any Rumanian territory, who do not possess another nationality (article 7 of the Rumanian Minorities Treaty).

Valachs of Pindus.—Greece has agreed to accord to the communities of the Valachs of Pindus local autonomy under the control of the Greek State, in regard to religious, charitable or scholastic matters. (Article 12 of the Greek Minorities Treaty.)

Mount Athos.—Greece has agreed (article 13 of the Greek Minorities Treaty) to recognize and maintain the traditional rights and liberties enjoyed by the non-Greek monastic communities of Mt. Athos under article 62 of the Treaty of Berlin, which reads: "The monks of Mount Athos, of whatever country they may be natives, shall be maintained in their former possessions and advantages, and shall enjoy, without any exception, complete equality of rights and prerogatives."

Muslims in Albania, Greece and the Serb-Croat-Slovene Kingdom.—The Greek Treaty (article 14), the Treaty with the Kingdom of the Serbs, Croats and Slovenes (article 10) and the Albanian Declaration (articles 2 and 3) lay down that all necessary measures shall be taken to enable questions of family law and personal status to be regulated in accordance with

[1]It should be observed that in the Czechoslovak Treaty there is no mention of "primary schools," the word employed being "instruction" in general without any limitation.

Muslim usage. At the same time these treaties guarantee the protection of mosques, cemeteries and other religious establishments.

Czech and Saxon Communities in Transylvania.—Rumania has agreed to grant these communities local autonomy in religious and scholastic matters, subject to the control of the Rumanian State (article 11 of the Rumanian Minorities Treaty).

Ruthene Territory South of the Carpathians.—Czechoslovakia has agreed to constitute this territory as an autonomous unit within the Czechoslovak State, and to accord to it the fullest degree of self-government compatible with the unity of that State. The régime is, according to the provisions of the treaty, to include a special diet having powers of legislation in all linguistic, scholastic and religious questions, in matters of local administration, and in other questions which the laws of the Czechoslovak State may assign to it. The governor of this territory must be appointed by the president of the republic and its officials must be chosen as far as possible from the inhabitants of the territory (articles 10 to 13 of the Czechoslovak Minorities Treaty).

THE DUTIES OF MINORITIES

The treaties contain no stipulations regarding the "duties" of minorities towards the States of which they form part.

The Third Ordinary Assembly of the League, however, in 1922, when defining certain points of the procedure to be followed in settling minority questions, also adopted the two following resolutions regarding the "duties" of minorities:

While the Assembly recognizes the primary right of the minorities to be protected by the League from oppression, it also emphasizes the duty incumbent upon persons belonging to racial, religious or linguistic minorities to co-operate as loyal fellow-citizens with the nations to which they now belong.

The secretariat of the League, which has the duty of collecting information concerning the manner in which the minorities treaties are carried out, should not only assist the Council in the study of complaints concerning infractions of these treaties, but should also assist the Council in ascertaining in what manner the persons belonging to racial, linguistic, or religious minorities fulfil their duties towards their States. The information thus collected might be placed at the disposal of the States Members of the League of Nations if they so desire.

THE LEAGUE OF NATIONS GUARANTEE AND PROCEDURE

All the Minorities Treaties, and also the chapters of the treaties of peace with Austria, Bulgaria, Hungary and Turkey[1] which relate to minorities, contain a clause establishing a League of Nations guarantee for such of their provisions as affect minorities. This clause reads as follows:

Poland (or Austria, Czechoslovakia, etc.) agrees that the stipulations in the foregoing Articles, so far as they affect persons belonging to racial, religious or linguistic minorities, constitute obligations of international concern and shall be placed under the guarantee of the League of Nations. They shall not be modified without the assent of a majority of the Council of the League of Nations. The United States, the British empire, France, Italy and Japan[2] hereby agree not to withhold their assent from any modification in these articles which is in due form assented to by a majority of the Council of the League of Nations.

Poland (or Austria, Czechoslovakia, etc.) agrees that any Member of the Council of the League of Nations shall have the right to bring to the attention of the Council any infraction, or any danger of infraction, of any of these obligations, and that the Council may thereupon take such action and give such direction as it may deem proper and effective in the circumstances.

Poland (or Austria, Czechoslovakia, etc.) further agrees that any difference of opinion as to questions of law or fact arising out of these Articles between the . . . Government and any one of the principal Allied and Associated Powers or any other Power, a Member of the Council of the League of Nations[3], shall be held to be a dispute of an international character under article 14 of the Covenant of the League of Nations. The . . . Government hereby consents that any such dispute shall, if the other party thereto demands, be referred to the Permanent Court of International Justice. The decision of the Permanent Court shall be final and shall have the same force and effect as an award under article 13 of the Covenant.

The first paragraph of these provisions confines the League's guarantee to "persons belonging to racial, religious or linguistic minorities." The significance of this restriction will be realized when we remember that the Minorities Treaties establish certain very important rights, such as the right to protection of life and liberty and certain rights as to equality, and this not only for the benefit of minorities but for that of all nationals, and indeed all the inhabitants of the country. If, therefore, a State which had subscribed to these undertakings infringed any provision establishing one of these rights, to the prejudice of a person not belonging to a minority, such an act would not bring the League's guarantee into play as the guarantee in this case applies only with regard to minorities.

According to the second paragraph, the members of the council (in other words certain Governments) alone have the right to bring to the attention of the Council any infraction or danger of infraction of any of the provisions relating to minorities. Accordingly, the report of the Italian representative, M. Tittoni, adopted by the Council on Oct. 22, 1920, mentions the sharp distinction between the right of the members of the Council (that is to say, certain Governments) to bring to the attention of the Council any infraction or danger of infraction of the terms of the treaties, and the right of the minorities themselves, or of States not represented on the Council, to bring such infractions or dangers of infraction to the League's notice. The directing of the Council's attention by one or more of its members to an infraction or danger of infraction is a judicial act which has the effect of bringing the question officially to the Council's notice, whereas a communication by which an infraction or danger of infraction is brought to the League's notice otherwise than by a Member of the Council merely constitutes a petition or report and cannot in itself have the effect of officially bringing the matter before the Council.

The right of the treaties thus established, according to which members of the Council alone can notify the Council of cases of infraction of the Minorities Treaties, has on a number of occasions given rise to discussion and controversy. Thus, at the time of the negotiations which led to the Albanian Declaration regarding the protection of minorities, the Greek Government asked that a clause should be inserted granting it the right to bring to the notice of the Council any infraction or danger of infraction of the obligations which Albania was about to assume. The Council thought that there was no occasion to insert such a clause, as it would have constituted an exception to the general principles adopted in all the Minorities Treaties. (*See* Minutes of the 14th Session of the Council Sept.–Oct. 1921, pp. 115 and 162.) In 1925 Count Apponyi, the Hungarian representative at the Sixth session of the Assembly, maintained that it ought to be possible for the Council to be notified directly, by means of petitions from certain sources—from supreme ecclesiastical organizations or the cultural or economic institutions of the different countries. (*See* Records of the 6th Assembly [plenary meetings], page 73.) M. de Mello Franco (Brazil), discussing this question in the personal statement which he made to the Council on Dec. 9, 1925, drew attention to the practical difficulties to which such a procedure would give rise, and also asserted that it was incompatible with the letter of the treaties in force, by which even States which are members of the League but have no seat on the Council have no power to bring to the latter's notice cases of infraction or danger of infraction of the terms of the minorities treaties.

The second paragraph of the provisions concerning the League of Nations guarantee further lays down that when once a Minorities question has been brought before it, the Council may "thereupon take such action and give such direction as it may deem proper and effective in the circumstances."

The extremely general character of this wording and the wide powers it confers upon the Council will at once be noticed, as also the fact that no indication is given as to the procedure to be fol-

[1] The Albanian and Lithuanian Declarations contain the same provision. For Estonia and Latvia, *see* p. 558.

[2] The Treaties of Peace with Austria, Bulgaria and Hungary read as follows: "The Allied and Associated Powers represented on the Council . . ." The United States of America is not mentioned in the Treaty of Lausanne.

[3] The Treaty of Lausanne reads as follows here: " . . . and any one of the other Signatory Powers or any other Power, a member of the Council of the League of Nations . . . (article 44)."

lowed by the Council in the settlement of Minorities questions[1]. The only rule of procedure applicable to this paragraph is that provided in article 4 of the Covenant of the League, which lays down that any member of the League not represented on the Council shall be invited to send a representative to sit as a member at any meeting of the Council during the consideration of matters specially affecting the interests of that member.

In practice the Council has always felt that it should act as an organ of conciliation in these matters, and accordingly all the Minorities questions with which it has had to deal have been settled by agreement with the Governments concerned. In two cases (the questions of settlers of German race in Poland and the acquisition of Polish nationality), the Council asked the Permanent Court of International Justice for an advisory opinion on certain points.

The third paragraph of the provisions relating to the League of Nations guarantees deals with the reference of minorities questions to the Permanent Court of International Justice. M. Clemenceau himself, in his covering letter to the Polish Minorities Treaty emphasized the importance of this clause whereby, as he said, "differences which may arise will be removed from the political sphere and placed in the hands of a judicial body." Acting in the spirit of this declaration the Third Assembly, in its resolution II. of Sept. 21, 1922, recommended that the members of the Council should appeal without unnecessary delay to the Permanent Court of International Justice for a decision in case of a difference of opinion with the Governments concerned as to questions of law or fact relating to the application of the minorities treaties.

PROCEDURE

The Council did not consider it necessary to institute a special procedure for the examination of minorities questions brought before it by any of its members, but laid down such procedure for petitions and communications in regard to the protection of minorities addressed to the League but not sponsored by any of the members of the Council.

This procedure provides machinery within the framework of the treaties, enabling minorities to appeal to the League by means of petitions, and it also ensures consideration of these petitions by a suitable body.

The treaties merely refer to the duty incumbent upon members of the Council of seeing that the clauses provided for the benefit of minorities are duly observed, but the members of the Council realized, even at their very first meetings, that, however desirous they might be of observing the spirit of the minorities treaties, they would find it very difficult in practice to keep themselves directly informed as to how these treaties were being applied. Moreover, it was in some ways undesirable that minorities should apply direct to members of the Council individually; appeals of this kind would have the same disadvantages as the old system of protection of minorities by the intervention of the Great Powers which the League of Nations guarantee had been specifically intended to obviate. The direct appeal of minorities to a foreign power would have the further disadvantage that it might be interpreted by the Government under which the minorities were placed as an act of disloyalty on their part. It was in order to obviate these difficulties that the Council of the League established its procedure for minorities as the best method of rendering effective the protection guaranteed to minorities by the League.

The Council was also anxious to give minorities a guarantee that their petitions would receive serious consideration; hence the institution of the "Minorities Committee."

The system of procedure as it exists to-day was not established all at once; it is the outcome of long experience and a series of adaptations. It is to be found in a number of Council resolutions which supplement or rectify each other, namely the report of the Italian representative and the Council resolutions of Oct. 22 and 25, 1920, and the resolutions of June 27, 1921, Sept. 5, 1923, and June 10, 1925.

The basic idea underlying the procedure thus instituted is that petitions are intended purely for purposes of *information.* The Council has carefully eliminated anything that might lead to procedure in which the respective cases of the minority and of the Government concerned would be heard as if they were two parties to a lawsuit, because it considered that such a situation was incompatible with the ideas and principles underlying the present organization of States.

Accordingly the secretary-general in principle merely acknowledges the receipt of a petition, and does not keep the petitioner informed as to what is done with it. (On this subject *see* the memorandum of the secretary-general, approved by the Council on June 10, 1926 [*Official Journal,* July, 1926, pp. 878 and 986].) The position of the petitioner in this procedure has frequently given rise to controversy. Reference may be made, for instance, to the speech of the Hungarian representative, Count Apponyi, at the Sixth session of the Assembly (Sept. 14, 1925). On that occasion Count Apponyi expressed himself definitely in favour of a procedure in which both parties, and therefore the representatives of the petitioners, would have an opportunity of presenting their case. In reply to this, M. de Mello Franco (Brazil) said in his personal statement to the Council dated on Dec. 9, 1925, that in his opinion such a conception "would give rise to dangers which would threaten the moral ends towards which the system of protection instituted by the minorities treaties is tending."

An analysis is given below of the various Council resolutions laying down the procedure for minorities' petitions (Resolutions of Oct. 22 and 25, 1920, June 27, 1921, Sept. 5, 1923, June 10, 1925).

Acceptance of Petitions.—As soon as a petition regarding the protection of minorities is received by the League secretariat it is submitted to a preliminary examination by the competent section. The object of this examination is to decide whether the petition can be accepted and the necessary procedure applied to it, or whether it should be declared inadmissible and rejected.

It is the secretary-general who has to decide whether a petition can be accepted or not. The Government to which the petition refers may, however, object to this decision, in which case the question must be submitted to the acting President of the Council, who may appoint two other members of the Council to assist him in the consideration of the matter. Lastly, if the State concerned so requests, this question of procedure may be placed on the Council's agenda (Council resolution of Sept. 5, 1923).

The conditions which a petition must fulfill in order to be accepted were laid down by the Council in its resolution of Sept. 5, 1923. They are as follows:

1. *Origin of the Petition.*—The only condition required is that the petition must not emanate from an anonymous or unauthenticated source.

2. *Form of Petitions.*—Petitions must not be worded in violent language.

3. *Contents of Petitions.*—As regards their contents petitions (*a*) must have in view the protection of minorities in accordance with the treaties; (*b*) in particular, must not be submitted in the form of a request for the severance of political relations between the minority in question and the State of which it forms a part and (*c*) must contain information or refer to facts which have not recently been the subject of a petition submitted to the ordinary procedure.

[1]The report submitted by the Sixth committee to the Third Assembly (1922) mentions an observation by Prof. Gilbert Murray (South Africa) to the effect that in certain localities of mixed population, where conflicts were frequent and serious, order had frequently been maintained and tranquillity restored by the mere presence of consuls or other representatives of foreign Governments who could impartially report on events and bring to bear the influence of a wider public opinion. Prof. Gilbert Murray also observed that cases might arise in which the presence of such a representative of the League might have an even more beneficent effect, in view of the disinterestedness and the moral prestige possessed by the League, and suggested that the Council might well consider the desirability in suitable cases of employing such representatives, with the consent of the Government concerned, to allay public excitement and gradually restore tranquillity in disturbed districts. The Committee felt the force of these observations and placed them on record, but, considering the variety of possible contingencies and the wide discretion in the hands of the Council for meeting them, thought best not to embody the proposals in a definite resolution.

Preliminary Communication of Petitions to the Government Concerned.—Originally (*see* report of M. Tittoni, Oct. 22, 1920) the Secretary-General, if he considered that a petition could be accepted, used to communicate it without comment to the Members of the Council for information.

The State concerned, if a Member of the League, was informed simultaneously with the Council as to the subject of the petition, it being a rule that every document communicated to the Members of the Council for information is communicated immediately to all Members of the League. In this way the State concerned had an opportunity of submitting to the Members of the Council such observations as it thought desirable to make.

Certain Governments, however, raised objections to this practice and proposed amendments to the procedure. On the basis of their proposals, the Council, by its resolution of June 27, 1921, modified the procedure so that all petitions concerning the protection of minorities, under the provisions of the treaties, from petitioners other than Members of the League, were communicated to the State concerned before being brought to the notice of the Members of the League. That State had a time-limit of three weeks within which to inform the secretariat whether it intended to make any comments or not. If its reply were in the affirmative, it had a total period of two months in which to submit its observations, which would be communicated, together with the petition, to the members of the council and to the Members of the League.

This procedure is still in force for the preliminary communication of petitions to the Governments concerned, but, as will be seen later, it has been modified as regards the communication of petitions to all the Members of the League.

There are, however, two exceptions to the above-mentioned rule. In both cases the petition is not communicated in advance to the Government concerned but is sent simultaneously to that Government and to the Members of the Council. The first of these exceptions refers to "exceptional and extremely urgent" cases. In such cases the Secretary-General, before communicating the petition to the Members of the Council, need only inform the representative of the State concerned accredited to the League secretariat. The question whether a case is of an exceptional nature or extremely urgent is left to the discretion of the Secretary-General. The second exception refers to petitions from a Government which is a Member of the League. As it was decided to communicate petitions in advance to the Government concerned only in the case of petitions "from petitioners other than Members of the League," it must be assumed that the original procedure remains in force as far as Members themselves are concerned.

The Council, in its resolution of Sept. 5, 1923, authorized the Member of the Council acting as president to extend, at the request of the Government concerned, the period of two months within which that Government must send in its observations.

Communication of Petitions to Members of the Council.—M. Tittoni's report explicitly provided that petitions should be sent by the secretary-general to the Members of the Council without comment. It was careful to add, however, that this communication of petitions did not constitute a juridical act, because the Council did not become competent to deal with a question unless one of its Members notified it that the subject of the petition constituted an infraction or danger of infraction of the Treaties. As already pointed out, therefore, this communication of petitions was intended purely for purposes of information. According to the procedure now in force (resolution of June 27, 1921) petitions are communicated to members of the Council either immediately, if the Government concerned declares that it does not wish to submit any observations on the petition, or at the end of the period of three weeks, if the Government concerned has not replied to the communication transmitting the petition to it, or, if the Government concerned says that it intends to present observations, as soon as these reach the secretariat. (Another possibility is that the Government concerned might state its intention to submit observations, but might not send them within two months; in such a case however, it would doubtless ask for an extension of the time-limit.) As already stated, urgent petitions and petitions from Governments of Members of the League are communicated simultaneously to the Members of the Council and the Government concerned. At the time when M. Tittoni's report was adopted by the Council the communication of a petition to members of the Council meant that it would also be communicated to all the Members of the League, since, as explained in the report, it was the settled practice of the secretary-general that every document communicated to the Members of the Council for information should also be sent to all members of the League. As, however, this practice gave rise to objections on the part of certain Governments which were signatories to minorities treaties[1], the Council, in its resolution of Sept. 5, 1923, decided that the communication of petitions and of observations (should there be any) by the Government concerned should be restricted to the Members of the Council, but that communication could be made to other members of the League or to the general public at the request of the Governments concerned or by virtue of a resolution passed by the Council.

The restriction which the Council introduced on Sept. 5, 1923, gave rise to a discussion by the Sixth committee of the Fourth Assembly (meeting of Sept. 25, 1923), as a result of which the Assembly, on Sept. 26, adopted a resolution confirming the Council's resolution of Sept. 5, but adding that "by virtue of paragraph v. of the Assembly resolution dated Sept. 21, 1922[2], the Government of any member of the League can request the secretariat to communicate to it any petitions (together with the observations of the Government concerned) which have been communicated to the Council."

The Minorities Committee[3].—The Council introduced into its procedure provisions whereby petitions, when once communicated to the members of the Council in ordinary cases together with the observations of the Government concerned, would be carefully considered by them. The object of this examination is to enable the members of the Council to decide whether they should or should not bring the subject of the petition to the Council's notice as constituting an infraction or danger of infraction of the treaties. With this object the Council decided in its resolution of Oct. 25, 1920, that with a view to assisting its members in the exercise of their rights and duties in the matter it was desirable that the president of the Council and two members appointed by him in each case should proceed to consider any petition or communication with regard to an infraction or danger of infraction of the clauses of the minorities treaties. There was thus instituted what came to be commonly known as the "Committee of Three" or "Minorities Committee," which has become one of the normal organizations of the League in the matter of the protection of minorities.

This committee was formed essentially in the interest of the minorities themselves, in order to enable them to appeal direct to the League. On this subject the *Supplementary Report* (A. 7. [*a*] 1925, p. 20) to the Sixth Assembly on the work of the Council contains the following passage: "(By the creation of the Minorities Committee) the Council has . . . placed at the disposal of the minorities a special body which enables them to state their claims without infringing in any way either the letter or spirit of the Treaties."

(a) *Composition of the Committee.*—A minorities committee

[1]This question was dealt with by the Polish and Czechoslovak Governments, by the former in its notes of Jan. 16 and Aug. 22, 1923, and by the latter in its note of April 5, 1923. These notes were summarized in the report submitted to the Council on Sept. 5, 1923, by M. de Rio Branco (Brazil). (See *Official Journal,* Nov. 1923, p. 1426.)

[2]Paragraph v. reads as follows: "The secretariat of the League which has the duty of collecting information concerning the manner in which the Minorities Treaties are carried out should not only assist the Council in the study of complaints concerning infractions of these treaties, but should also assist the Council in ascertaining in what manner the persons belonging to racial, linguistic or religious minorities fulfil their duties towards their States. The information thus collected might be placed at the disposal of the States Members of the League of Nations if they so desire."

[3]For all matters relating to the Minorities Committee see *Supplementary Report* to the Sixth Committee on the work of the Council and of the secretariat (A. 7 [*a*] 1925, pp. 17–20).

is formed to deal with each petition. Until June 10, 1925, these minorities committees were composed of the acting President of the Council at the time when the petition and the observations of the Government concerned were circulated to the members of the Council, and two other members chosen by the President from among any of his colleagues. On June 10, 1925, the Council adopted a resolution confirming, as regards the composition of these committees, certain rules which were already applied in practice and were designed to ensure that the committees would be independent and impartial. According to this Council resolution the members of a minorities committee cannot include either the representative of the State to which the persons belonging to the minority in question are subject, or the representative of a neighbouring State or of a State a majority of whose population belong from the ethnical point of view to the same people as the persons who are members of the minority in question. If the acting President of the Council himself comes under any of these three categories, recourse will be had to the member of the Council who was president before him and who is not in the same position.

(b) *The Committee's Method of Work.*—The above-mentioned *Supplementary Report to the Sixth Assembly* gives the following particulars as regards the working of the minorities committee:

"After the communication of the petition to the Council, with the observations, if any, of the interested Government, the director of the minorities section addresses a letter, accompanied by a copy of the document in question, to the acting president of the Council, reminding him that it is his duty to appoint two of his colleagues in order to proceed without delay to an examination of the document. As soon as the president has sent his reply, the director of the minorities section gets into touch with the two other members of the Council.

"The minorities section, in some cases in collaboration with the legal section, prepares for the use of the three members of the committee a written statement on the questions of fact and law raised by the observations of the interested Government. Further, the minorities section is at the disposal of the members of the Committee and of the members of the Council to procure for them any supplementary information which they may wish to receive.

"The meetings of the minorities committee, or more correctly of the various minorities committees, which are simultaneously at work, generally take place during the sessions of the Council. Of late, some meetings have also taken place between the sessions of the Council owing to the difficulty of finding in all cases during the sessions of the Council the time necessary for the discussion of these matters, which are sometimes extremely detailed and prolonged, and which always have a delicate side to them and require the most conscientious preparation both by the secretariat and by the members of the Council.

"The examination of a case by the minorities committee is not, of course, restricted to the formal meetings of the committee. It is the duty of each member of the committee, as well as of the secretariat, to proceed to this examination without delay after the communication to the Council of the document relating to the case. The secretariat begins an examination of the case without waiting for the distribution of this document. The discussion is accordingly, from the first meeting of the three members of the committee, except perhaps in cases of extreme urgency, based on a very considerable amount of preparatory work.

"The meetings of the committee are held in private, and no formal minutes are kept. Each committee is free to adopt its own procedure.

"It results from the object of the work undertaken by a minorities committee that its members are free to form the best opinion they can of all the factors in the case which they are asked to examine. They may take into consideration the greater or less importance of the case, and its more or less general significance. They may take into account the attitude more or less conciliatory of the interested Government towards the requests of the minority as well as the attitude more or less loyal of the persons belonging to the minority. They may form the opinion, in a particular case, that the petitioner should have resorted to the administrative or judicial authorities of the country before addressing the League of Nations. In the minorities committees all these factors are continually discussed and taken into consideration.

"The members of the committee may, moreover, enter into correspondence with the interested Government with a view to removing doubts or misunderstandings or making friendly suggestions to the Government to induce it to modify its attitude on a point which, failing such a solution, would appear to the members of the committee to be a case which should be brought to the attention of the Council. Before deciding whether it should or should not draw the attention of the Council to a matter which is the subject of a petition the members of a committee have in many cases asked the interested Government for supplementary information either in general terms or by putting definite questions. In some cases, such requests have been accompanied by other suggestions, as, for example, that the interested Government should postpone taking any steps which might have the effect of creating a *fait accompli* before the committee was in a position to take a decision on the question of substance.

"The members of the committee have, in certain cases, made personal representations to the representative of the interested Government, with the object of drawing friendly attention to the advisability of putting an end to the difficulties with which the minority is concerned. In the majority of cases the committee addresses the Government in question through the director of the minorities section of the secretariat, either by writing or verbally, either formally or informally.

"The committee often does not reach a final decision, even after having received all the supplementary information which it may desire. The case may be regarded rather as a link in a long chain than as an independent affair, and the members of the committee sometimes consider that such a case, although of secondary importance in itself, may be of a character to be brought before the Council, if other similar cases should arise. The committee, in these circumstances, invites the minorities section to follow the case for a certain period of time, and to notify it if there should arise any fact which would appear to justify a further discussion between its members."

(c) *Object of the Committee's Examination.*—In its resolution of Sept. 5, 1923, the Council clearly specified that the consideration by the committee of petitions and the observations of the Governments concerned is intended solely to determine whether one or more members of the Council should draw the Council's attention to an infraction or danger of infraction of any of the clauses for the protection of minorities. As the Council also stated in the same resolution, the fact that the committee is considering a petition or observation in no way affects the right of any member of the Council not represented on the committee to draw the Council's attention to an infraction or danger of infraction of those clauses.

It will be clear from what has been said above regarding the working of the minorities committee what an important part this committee plays as a means of conciliation and pacification in this difficult and delicate problem. The flexibility of its procedure enables its members to take into account the special circumstances of each case. In short, the work of the minorities committee has enabled full effect to be given to a resolution which was adopted by the Assembly at its Third Session (1922) with a view to defining the League's methods in the matter of the protection of minorities. "While in cases of grave infraction of the minorities treaties it is necessary that the Council should retain its full power of direct action," so it is set forth in the resolution of 1922, "the Assembly recognizes that in ordinary circumstances the League can best promote good relations between the various signatory Governments and persons belonging to racial, religious or linguistic minorities placed under their sovereignty by benevolent and informal communications with those Governments."

THE COUNCIL OF THE LEAGUE AND THE PROTECTION OF MINORITIES

Since its creation, the Council has at almost every session been called upon to consider questions connected with the protection of racial, linguistic or religious minorities. Mention should be made in the first place of the steps taken by the Council to prepare the declarations concerning the protection of minorities made by Albania, Finland, Estonia, Latvia and Lithuania. The first part of this article contains information concerning the work of the Council in this domain.

The Council has also had occasion to establish, in a series of resolutions which have been examined in the previous pages, the procedure applicable to petitions addressed to the League of Nations concerning the protection of minorities. It is not necessary to dwell here at any length on this aspect of the Council's work, which has already been studied in a previous section of this article. Nor is it necessary to revert to the discussions of the minorities committees of the Council with regard to minority petitions.

Finally, the Council has dealt with a number of definite cases connected with the situation of certain minorities in various countries. These questions, which in most cases had formed the subject of petitions addressed to the League, were placed on the Council's agenda through the action of certain members of the Council, who, in accordance with the procedure, had been asked to examine them. The complicated nature of these ques-

tions makes it impossible to give even a brief summary of the main facts. It has seemed preferable, therefore, merely to give a list of the various minorities and the questions concerning them considered by the Council, indicating the sessions at which they were examined.

Situation of the Muslim Minority of Albanian Origin in Greece.—Council sessions of Sept. and Dec. 1924, and March, June and Sept. 1925.

Bulgarian and Greek Protocols for the Protection of the Greek Minority in Bulgaria, and the Bulgarian Minority in Greece.—Council sessions of Sept. 1924 and March and June 1925.

Minorities in Upper Silesia.—Since the coming into force of the convention on Upper Silesia between Germany and Poland the Council has dealt with a number of minorities questions which it has had to consider in virtue of one or another article of this convention. These were mainly concerned with schools. So far back as its session in March 1924, the Council examined a case connected with the opening of three German minority schools in Polish Upper Silesia; at its session in March 1927, it was called upon to settle a question of principle concerning the admission of children to German minority primary schools in Polish Upper Silesia. Subsequently, at its session in March, June and Sept. 1928, the Council had to examine a number of questions connected with German minority schools in Polish Upper Silesia.

The Council further examined, at its session in March 1926, a petition concerning the personal status of Karl Michalik, a member of the Polish minority in German Upper Silesia, and a petition from the "Union of Poles in Germany" concerning the payment of certain indemnities by the German Government. Finally, at its session in June, Sept. and Dec. 1928, the Council examined two petitions concerning the security of the Polish minority in German Upper Silesia, and the German minority in Polish Upper Silesia respectively.

Jewish Minority in Hungary. (Question of the "*Numerus clausus*".)—Sessions of Sept. 1922 and Dec. 1925.

Position of the Polish Minority in Lithuania.—Council sessions in March, June and Sept. 1925.

German Minority in Poland.—(a) Question of colonists of German race in Poland, and (b) Acquisition of Polish nationality. The Council was engaged in examining these questions from its session in Dec. 1921, until its session in June, 1924. On each of these questions the Council asked for an advisory opinion from the Permanent Court of International Justice.

Hungarian Minority in Rumania. Question of Colonists of Hungarian Race in the Banat and Transylvania.—Council sessions of March, June and Sept. 1925.

Minorities in Czechoslovakia.—Question concerning the autonomy of the Ruthene territory south of the Carpathians. Session of Nov. 1920.

Minorities in Turkey.—(a) Greek minority in Constantinople and Turkish minority in Western Thrace. Council sessions of Oct. 1924 and March and Dec. 1925. (b) Armenian minority in Turkey. Council sessions of Dec. 1925. (P. de Az.)

MINOR PLANET. The minor planets or asteroids are a vast host of very small planets that revolve round the sun in orbits that nearly all lie between those of Mars and Jupiter, though a few of them transgress these limits. The existence of a planet between Mars and Jupiter was suspected before any of them were found, on the ground of an empirical law of planetary distances which was first put forward by Titius, a contemporary of Kepler, though it attracted more notice when Bode restated it in 1772. The law assigned the following numbers as representing the distances very closely: Mercury 4, Venus 7, Earth 10, Mars 16, (blank) 28, Jupiter 52, Saturn 100, (next planet) 196. It will be seen that, except in the first case, each interval is double the preceding one.

When in 1781 Sir W. Herschel discovered Uranus, which fitted exactly with the next term in the series after Saturn, conviction was strengthened of the existence of a planet in the gap, and a society of 24 astronomers, with Baron de Zach at its head, was formed to devote itself to the search. Giuseppe Piazzi, director of the Palermo Observatory, was not a member of this society, but on Jan. 1, 1801, while examining a region in Taurus, he observed a small star which he had not seen in the place before; he soon found that it was moving, and followed it up till Feb. 11. In the interval it ceased to retrograde, and commenced to advance. In the following autumn difficulty was experienced in finding the body again; this served as an incentive to the mathematician Karl Friedrich Gauss to improve the existing methods of computing orbits from a few observed positions. As a result of his calculations Heinrich W. M. Olbers of Bremen recovered Piazzi's planet just a year after its discovery. (The three astronomers associated with the finding of the first asteroid have been commemorated by naming the planets numbered 1,000, 1,001, 1,002 Piazzia, Gaussia and Olbersia.) The new planet was named Ceres; its distance agreed exactly with the value predicted by the Titius-Bode law, but it was very small (modern measures give a diameter of 480 miles, about one-fifth of the moon's), and its orbit was inclined to the ecliptic at the large angle of $10°37'$. Perhaps these circumstances led Olbers to suspect that it was one of a group of small planets, for he continued to sweep the sky after he had recovered it, and three months later he found Pallas, whose distance from the sun proved to be almost the same as that of Ceres; its orbit was inclined at the very large angle of $34°43'$, and the eccentricity was also large. A third and fourth member, Juno and Vesta, were added to the family within six years by Harding and Olbers

respectively. Vesta is the brightest of the whole family, sometimes attaining visibility to the naked eye; but its diameter is only half that of Ceres. It was natural that the discovery of these four little planets, revolving in closely adjacent orbits, should suggest the idea that a larger orb had been rent asunder by an explosion. This idea held the field for many years, and indeed has been revived of late in a modified form. It seems to have been assumed that four fragments completed the set, and search was abandoned till 1830; it was then renewed by M. Hencke of Driessen, who after fifteen years' search found Astraea, and commenced a chain of discoveries which has continued without intermission. By 1890 about 300 small planets had been found, all by visual search at the telescope, a very laborious method, necessitating the charting or memorizing of numbers of faint stars and searching for strangers among them. At the time Prof. Max Wolf of Königstuhl, Heidelberg, introduced the photographic method of search, which had been suggested earlier by Dr. Isaac Roberts. An equatorial telescope with a photographic plate in the focus was made to follow the stars, which were registered as discs, while a planet appeared as a short trail owing to its motion during the exposure. This method produced a great acceleration in the rate of discovery, and nearly two thousand announcements of discoveries were made between 1890 and 1927. Not all of these have been permanently numbered. When the number of planets grew large there was found to be a danger of mistaking a previously discovered planet for a new one, and it was decided to postpone the numbering of a planet till five good observations, extending over some weeks, were available, thus enabling a reliable orbit to be deduced. 1,055 planets have now (1927) been numbered, but several hundreds more are known to exist, and approximate orbits have been found for some of them.

DESCRIPTION OF THE PLANETS

The following description is confined to the first 900 members, as details of the remainder were not available when it was prepared. There are two stragglers well on the inside of the family; these are Eros (see separate article) whose mean distance is less than that of Mars, and Hungaria (which, curiously, was the very next discovery to Eros in order of time) at a mean distance of 1·9 astronomical units. The main body begins at mean distance 2·1 units, and continues without a break up to 3·5 units. Then follows a gap with a group of six (the Hilda group) at 3·9 units, and an isolated planet, Thule, at 4·3 units. Its name is from the classical "Ultima Thule," as it was thought to mark the outer boundary of the family till the Trojan group was found; that group consists of six planets, whose mean distance is 5·2 units, the same as that of Jupiter (*see* TROJAN PLANETS).

Although the main body has no absolute gaps there are several very sparse regions in it. These correspond to the distances where the period is a simple fraction of Jupiter's period, 11·86 years. The most notable gap is at 3·3 units, where the period is half Jupiter's; there is also a marked one at 2·5 units, period one-third of Jupiter's; the others are more feebly marked. The richest region of all is just inside the chief gap. Similarly in Saturn's ring the brightest part is just inside the great division, which is at a distance from Saturn corresponding to half the period of Mimas. In each case the reason is the same; repeated perturbations at the same region of the orbit cause a slight change in the period and distance; inward shift has predominated, causing the rich region inside the gap. The influence of Jupiter on the motions of the asteroids is made manifest in another way: when the positions of their perihelia, or nearest approaches to the sun, are plotted on a diagram, it is seen that they congregate towards Jupiter's perihelion; the density of distribution is here three times as great as in the opposite region.

The eccentricities of the orbits are distributed as follows: 209 planets have eccentricity between 0 and ·087, 375 between ·087 and ·174, 248 between ·174 and ·259, 49 between ·259 and ·342, 7 between ·342 and ·423, while four stragglers, Albert, Alinda, Ganymede and Hidalgo have eccentricity greater than one-half. The figures for inclination of orbits to the ecliptic are: 222 planets between 0° and 5°, 297 between 5° and 10°, 222 between 10° and 15°, 98 between 15° and 20°, 35 between 20° and 25°, 14 between 25° and 30°, and 3 above 30°. There seems to be a tendency for high eccentricity and inclination to go together.

The diameters can be estimated only by the amount of light that we receive, since with few exceptions they are too small to measure even with the largest telescopes; the albedo has to be estimated, and some uncertainty is thus introduced. 195 planets have estimated diameters exceeding 61 miles, 502 between 61 and 25 miles, 193 between 25 and 10 miles, and 22 less than 10 miles, but these last very small ones can be seen only when they come fairly near to the earth, so there may be many of them undiscovered in the outer part of the asteroid zone. Estimates of the total mass of the family have been made, assuming a density equal to that of the moon; the following is taken from "Astronomy," by Drs. Russell, Dugan and Stewart p. 352. The total mass of the known asteroids is about 1/3000 of that of the earth, Ceres and Pallas accounting for half of the whole; the undiscovered ones, though probably numerous would be mainly small, so that 1/500 of the earth is an extremely liberal estimate for the whole family. It thus appears that, even if united, they would form an insignificant planet.

There appears to be no reason to expect that the smaller planets would have a spherical form. In the case of large planets the force of cohesion is negligible compared with the gravitational forces, and any large departure from the figure of equilibrium is impossible; but with small bodies cohesion would be stronger than gravitation. Irregular forms are suggested by the fact that the light of many asteroids is variable; this indicates either irregularity of shape or unequal albedo of different parts of the surface. It has been stated that the observed light curves are satisfied better by the unequal-albedo explanation, but the observations are so delicate that this can scarcely be considered decisive. On the albedo hypothesis the variation of light would have the same period as the rotation, on the other hypothesis half the period. The periods of light-change are a few hours—three hours for Eunomia, five and a quarter for Eros, eight and three-quarters for Tercidina. It may be possible to examine the shape of Eros at the near approach, in Jan. 1931, as it should show a disc with large instruments.

The explosion hypothesis, after having been generally abandoned, has been revived in recent years by some astronomers. Dr. H. J. Jeffreys ("The Earth," p. 60) suggests that a primitive satellite of Jupiter may have escaped from the control of that planet and subsequently exploded, possibly through the raising of its internal temperature by radioactive matter; some of the fragments might again explode, which would explain the wide distribution of the orbits. Again Prof. K. Hirayama, after an exhaustive study of the orbits, and an attempt to find their primitive or undisturbed forms, found five families of planets, each family having orbits so closely related as to suggest a common origin. The families are named from their brightest member; the Flora family, distance 2·2, has 57 members; the Maria family, distance 2·5, 13 members; the Coronis family, distance 2·9, 15 members; the Eos family, distance 3·0, 23 members; the Themis family, distance 3·1, 25 members. Prof. Hirayama conjectured that each family was produced by the explosion of a single planet, but it appears that the facts might also be explained on the "planetesimal" hypothesis, by postulating that several knots or condensations were present in the streams of particles, each knot subdividing before final concentration so as to form a group of tiny planets instead of a single larger one. The well-defined "Hilda" group may perhaps be added to the five families. Another interesting group is named after "Albert," the first member to be discovered; it has two other members, Alinda and Ganymede (not to be confused with Jupiter's third satellite). These are extremely small bodies (the first two are about three miles in diameter, the third about 20). They have periods of about four years; and they approach at perihelion within some twenty million miles of the earth's orbit, but recede at aphelion to within a unit of Jupiter's orbit. When in opposition at perihelion they have direct motion in longitude, whereas retrograde motion is the usual rule in that position; the reason is that their linear velocity then

exceeds that of the earth. Owing to their small size they cannot be observed at all except when fairly near perihelion. Albert was unfortunately insufficiently observed at its first apparition, and is now lost; but the other two have been very well observed. A still more remarkable asteroid is No. 944 Hidalgo, discovered by Dr. Baade at Bergedorf observatory in 1920. Its perihelion distance is two units from the sun, its aphelion distance nine and a-half units (near the orbit of Saturn), its period 13·84 years, and the inclination of its orbit to the ecliptic 43½ degrees. The orbit is distinctly of a cometary character, but the object was carefully examined, and failed to show the faintest sign of nebulosity, so it is difficult to classify it as a comet. It approaches Jupiter's orbit closely one and three-quarter years after perihelion, so its present orbit may be due to perturbations by that planet. A similar but still more remarkable asteroid, discovered at Tokyo in January 1927, and temporarily designated Tokyo 1, has perihelion distance one and a quarter units, but aphelion near the orbit of Uranus, its period being 34·8 years. Its inclination is only six degrees, so it passes near Jupiter's orbit. It seems possible that both this object and Hidalgo are the remains of comets which have lost their supply of gas, and whose nuclei resemble asteroids in appearance.

The task of keeping the thousand members of the asteroid family from being lost is a heavy one, and needs international co-operation both in computation and observation. The chief centres for computation are the Recheninstitut at Berlin, the Nice and Marseilles observatories, and Berkeley observatory, California; while observations (mainly photographic) are made at Königstuhl, Bergedorf, Simeis (Crimea), Uccle, Marseilles, Nice, Algiers, Barcelona, Johannesburg, Yerkes observatory, etc. The late Dr. J. Palisa made many discoveries and observations at Vienna.

The following work by Dr. G. Stracke gives full details about the discovery and the elements of all the asteroids found up to the year 1925, together with other particulars. "Identifizierungsnachweis und Elemente der Kleinen Planeten" (*Veröffentlichungen des Astronomischen Rechen-Instituts zu Berlin-Dahlem*, No. 45). (A. C. D. C.)

MINOS, a semi-legendary king of Crete, the son of Zeus and of Europa. By his wife, Pasiphaë, he was the father of Ariadne, Phaedra, and others. Ariadne is equated with Aphrodite; Pasiphaë has been explained as a lunar deity, and a goddess of that name was worshipped in Laconia (Plutarch, *Agis*, 9). Minos reigned over Crete and the islands of the Aegean three generations before the Trojan war. He "reigned for eight years and was the gossip of Zeus" (*Odyssey*, xix. 178), which may mean that he was a divine being, an incarnate god, replaced every ninth year (so Frazer). He was the author of the Cretan constitution and the founder of its naval supremacy (Herodotus iii. 122; Thucydides i. 4). In Attic tradition and on the Athenian stage, Minos is a cruel tyrant, the heartless exactor of the tribute of Athenian youths to feed the Minotaur (q.v.). Recent discoveries in Crete (q.v.) prove the existence of a civilization, the "Minoan" culture, the lord of which may well have had Athens and many other places tributary to him. Minos himself is said to have died at Camicus in Sicily, whither he had gone in pursuit of Daedalus, who had given Ariadne the clue by which she guided Theseus through the labyrinth. He was killed by the daughter of Cocalus, king of Agrigentum, who poured boiling water over him in the bath (Diod. Sic. iv. 79). Subsequently his remains were sent back to the Cretans, who placed them in a sarcophagus, on which was inscribed: "The tomb of Minos, the son of Zeus." After his death he became judge of the shades in Hades, associated with Aeacus and Rhadamanthus.

MINOT, LAURENCE (*fl.* 1333–1352), English poet, the author of 11 battle-songs, first published by Joseph Ritson in 1795 as *Poems on Interesting Events in the reign of King Edward III.* They had been discovered by Thomas Tyrwhitt in an early 15th century ms. (Cotton Galba, E. IX., British Museum) which bore on the fly-leaf the misleading inscription: "Chaucer, Exemplar emendate scriptum." The poems were evidently written contemporaneously with the events they describe. The first celebrates the English triumph at Halidon Hill (1333), and the last the capture of Guines (1352). Nothing whatever is known of Minot's life, but the minuteness of his information suggests that he accompanied Edward on some of his campaigns. Though his name is Norman, he writes vigorous and idiomatic English of the northern dialect with some admixture of midland forms. His poems are instinct with a fierce national feeling.

There are excellent editions of Minot's poems by Wilhelm Scholle (*Quellen und Forschungen*, vol. lii., Strasbourg, 1884), with notes on etymology and metre, and by J. Hall (2nd ed., 1897).

MINOT, a city of North Dakota, U.S.A., in the valley of the Mouse river, 236 m. W. by N. of Grand Forks; the county seat of Ward county. It is on Federal highway 2 and the main lines of the Great Northern and the Soo Line railways. Pop. (1920) 10,476 (84% native white); was 16,099 in 1930 by Federal census. The winding river, bordered by trees and shrubs, flows through the city, and the valley is surrounded by high, bluff-like hills. There are 200 ac. in public parks. The Minot State Teachers college (opened 1913) occupies a beautiful campus of 70 ac. and had a total net enrolment in 1926–27 of 2,334. Minot is the chief trading centre for the northern part of the State, where dairying, poultry-raising, and balanced farming are rapidly developing, supplementary to the basic occupation of wheat-growing. Its tributary territory is about the size and shape of the State of Indiana. The nearest larger city to the west is Great Falls (Montana), 600 m. away. There are wholesale groceries, distributors of agricultural implements and automobiles, and many other jobbing houses doing a large business. Bank debits to individual accounts in 1927 amounted to $84,000,000. Minot lies within the great lignite coal fields of the State, and the largest strip lignite mine in the world lies not 30 m. from the city. Minot was founded in 1886, when the Great Northern railway reached this point. About 5 years later the Soo Line crossed the Great Northern here, establishing the new town as a natural distributing centre for north-western North Dakota and north-eastern Montana. It was incorporated as a city in 1887 and has had a commission form of government since 1909.

MINOTAUR [Gr. Μινώταυρος, from Μίνως, and ταῦρος, bull], in Greek mythology, a fabulous Cretan monster having the body of a man and the head of a bull. This creature was supposed to be the offspring of Pasiphaë, the wife of Minos, and a snow-white bull, sent to Minos by Poseidon for sacrifice. Minos, instead of sacrificing it, spared its life, and Poseidon, as a punishment, inspired Pasiphaë with an unnatural passion for it. The monster which was born was shut up in the Labyrinth (q.v.). It happened that Androgeus, son of Minos, had been killed by the Athenians, who were jealous of the victories he had won at the Panathenaic festival. To avenge the death of Androgeus, Minos demanded that seven Athenian youths and seven maidens should be sent every ninth year to be devoured by the Minotaur. When the third sacrifice came round Theseus volunteered to go, and with the help of Ariadne (q.v.) slew the Minotaur.

It seems possible that a confused reminiscence of actual bull-baitings, perhaps a sacred rite, which are attested by Cretan wall-paintings, has something to do with this story. Pictures of half-human monsters are also common; *see* especially the seal-impression of a minotaurlike creature, *Brit. Sch. Ath.* VII. p. 18. But their meaning, like the original significance of the myth, awaits explanation.

See Helbig in Roscher's *Lexikon der Mythologie;* F. Durrbach in Daremberg and Saglio's *Dictionnaire des antiquités;* A. B. Cook in *Classical Review* xvii. 410; J. G. Frazer, *Golden Bough* iv. 10 et seq.

MINSK, a former government of Russia, now in the White Russian S.S.R. (*q.v.*).

MINSK, the capital of the White Russian S.S.R., on the Svisloch river, a non-navigable tributary of the Berezina, in 53° 54′ N., 27° 33′ E., at the intersection of the Moscow-Warsaw and Libau-Kharkov railways. Pop. (1926) 123,613. It was the headquarters of the IV. Army Corps under the Tsarist government. Its close proximity to the west Russian front involved it in the disorders of the Russian retreat. In November 1917 an executive committee of soviet workers, soldiers and peasants was formed in the town, but in 1918 Minsk was occupied by German troops, who advanced as far as the Dnieper river, but withdrew after the

revolution in Germany. In spring, 1919, a Polish army occupied the district, and Minsk did not settle down to peaceful development until the beginning of 1921. The effects of this period of destructive strife are still evident, and there is terrible overcrowding in the city, owing to the rapid growth of its population and the destruction of housing accommodation during the war.

The province around Minsk is more favourably situated as regards agriculture than the rest of White Russia, and the town therefore has a less serious unemployment problem, though the situation is sufficiently difficult, especially in view of the interruption of its trade with the west, owing to changes of boundary. The town has smelting and machinery works, a bristle industry depending on the marked development of pig-breeding in the province, a brewery, two leather factories and a paper factory. The town has a municipal electricity and water supply. There is a White Russian government university, a communist university, and an institute for research into White Russian culture, with a Polish and a Jewish branch. An institute was established in 1927 to study the problems of White Russian agriculture and forestry. The numerous small Jewish traders were thrown out of occupation after the 1917 revolution and efforts have been made to settle them in other parts of Russia in order to relieve the local unemployment problem.

Its position near the west has always made it liable to invasion. Minsk is mentioned in Russian annals in the 11th century under the name of Myen'sk, or Menesk. In 1066 and 1096 it was devastated, first by Izyazlav and afterwards by Vladimir, prince of Kiev. It changed rulers many times until the 13th century, when it became a Lithuanian fief. In the 15th century it was part of Poland, but as late as 1505 it was ravaged by Tatars, and in 1508 by Russians In the 18th century it was taken several times by Swedes and Russians Russia annexed it in 1793, but within a few years it was laid waste by Napoleon I. (1812).

MINSTER, two towns of Kent, England.

1. Minster-in-Thanet, in the Isle of Thanet, lies above the Minster marshes, Stour valley, 4 m. W. of Ramsgate by rail. Pop (1921) 2,915. The church of St. Mary has a Norman nave and Early English transepts and chancel. The carved choir-stalls are a notable feature. The church belonged to a nunnery, founded at the close of the 7th century. Fruit-growing is carried on.

2. Minster-in-Sheppey, a seaside resort in the Isle of Sheppey. Pop. (1921) 3,059. It has a fine church, dedicated to St. Mary and St. Sexburga, originally attached to a 7th century convent founded by Sexburga, widow of Erconberht, king of Kent. The present building is a portion of the 12th century conventual church founded by William de Corbeuil, archbishop of Canterbury; it retains also traces of pre-Norman work. The abbey gatehouse remains. There are oyster beds in the neighbouring sea

MINSTER, the church of a monastery, or one to which a monastery has been attached. In the 10th century the name was applied to the churches of outlying parishes, and is now given to some of the English cathedrals, such as York, Lincoln, Ripon and Southwell, and to large churches or abbeys, like those of Sherborne, Wimborne or Westminster.

MINSTREL. The word "minstrel," derived from the Latin *minister*, a servant, was used after the 13th century to signify a household entertainer, its earlier equivalent being "jogelour" (Fr. *jongleur*). Still earlier the same part was played by the Teutonic gleeman or *scôp*. In the Anglo-Saxon poem that bears his name, Widsith, the far-traveller, wanders from place to place, from the Picts and Scots in the west to the Medes and Persians in the east, singing and telling stories and welcomed everywhere; from the Ostrogoth Eormanric (Hermanric, d. 375) he receives a collar of gold, and on his return home he is given an estate. Other early poems, such as *Beowulf*, show the honour in which these minstrels were held in pagan times; but, although patronized by Charlemagne, they were denounced by the Church with a vigour and frequency which show how ineffective such denunciations were in stemming their popularity.

The term minstrel covered a great variety of performers. At the head of the profession the place of the *scôp* was taken in the 11th century by the *trouvère* (*q.v.*) or the *troubadour* (*q.v.*), who was often a man of high social standing. Such a *trouvère* was Taillefer, who led the Norman attack at Hastings, singing the song of Roland and juggling with his sword. After the Conquest, Berdic, *joculator regis*, is shown by Domesday to have been given estates in Gloucestershire; and the traditions that Rahere, founder of St. Bartholomew's priory at Smithfield, had been minstrel to Henry I., and that Richard I. was discovered in his captivity by his minstrel Blondel, if not true to fact, show the position occupied by such persons in popular opinion. Master Henry, *versificator regis*, to whom Henry III. made various gifts, may have been one of the last of the English *trouvères;* certainly after that king's reign the minstrels seem to take a lower place in society. Kings and nobles still kept their minstrels, even so strict a churchman as Bishop Robert Grosseteste having a private harper, but they were more professional musicians. For these there were professional schools at Beauvais, Cambrai, Lyons and elsewhere, and in many towns they formed themselves into gilds, of which the earliest known is the *Pui* of Arras, founded in 1105. The minstrels' gild of Paris, of which the head was called *roy des ménestriers*, was founded in 1321 and lasted to 1776; in London the minstrels were incorporated in 1469, and all minstrels in the country were ordered to join the gild, but this order was ignored, and when a new charter was granted in 1604 the gild's jurisdiction was limited to three miles beyond the city. The gild still exists as the Corporation of Musicians of London. Canterbury had such a fraternity in 1526, and that of Beverley claimed to date from the time of Athelstan, certainly existed in the 15th century, and was reorganized in 1555, when rules were made that members must be minstrels to men of honour, "waits" to some town,[1] or otherwise approved. The minstrels of the county of Chester were from an early date (traditionally 1210) under the control of the head of the family of Dutton, whose rights were recognized in all the vagrancy acts from 1572 onwards; as late as 1756 the heir of Dutton held a court at Chester fair and issued licences to musicians. Similarly at Tutbury John of Gaunt in 1380 established a *roy des ministralx*, whose court was still held at the end of the 17th century.

Mediaeval account rolls of the expenses of royal and noble households, towns and monasteries are full of payments, often lavish, to all kinds of minstrels, musicians, players and jugglers, and at the marriage of Princess Margaret in 1290 no fewer than 426 minstrels, English and foreign, attended. Most of these came with noble guests, and the king himself, Edward I., had a large staff of musicians, partly minstrels and partly military band, as had his successors. But by the 15th century the day of the real minstrel was passing; and with the coming of printing the taste for listening to long chanted ballads and romances died out, and the minstrel became more and more an instrumental performer, just as the "minstrels' galleries" in the halls of Tudor houses were purely for instrumental or choral music. With the 16th century the minstrels became players, in the sense of actors, or degenerated into that "thing of shreds and patches," the wandering minstrel.

Even from early times there had been many of these unattached, vagrant entertainers, picking up a precarious living by performing in fairs and village taverns, or thrusting themselves brazenly into the halls of the great, risking kicks for the sake of halfpence. It was against these, headed by the Goliards (*q.v.*), that the Church chiefly fulminated for their ribaldry, indecency and lack of reverence. The State also viewed them with disfavour as men who wasted their own time and that of their listeners, and, not unjustifiably, as promoters of sedition. For these masterless men carried the news from place to place, sang biting lampoons against unpopular ministers, or voiced the wrongs of the poor; and such revolts as the Peasants' rising of 1381, Jack Cade's of 1450, and other more local riots seem to have owed much to their activity. Consequently from the time of the Black Death (1349) onwards, and particularly after 1572, they were continually in danger of the stocks, the whipping-post and prison.

[1]The chief English towns, such as London, York, Chester, Bristol, Coventry, etc., had minstrels, usually called "waits," who wore a livery and silver badge and combined the duties of town band and night-watchman, "piping the watch" at fixed hours of the night.

The best account of the subject is in E. K. Chambers, *The Mediaeval Stage*, i., 23–86, and ii. 230–266 (1903); where references are given to other works. *See* also A. Schultz, *Das höfische Leben zur zeit der Minnesinger* (1889); J. Jusserand, *English Wayfaring Life* (3rd ed., 1925). (L. F. S.)

MINT. A place where coins are manufactured, usually with the authority of the State.

According to Herodotus, the first mint was probably that established by Gyges in Lydia towards the end of the 8th century B.C. for the coining of gold, silver and electrum, an alloy of gold and silver. Silver was coined in the island of Aegina soon afterwards. The art of coining was introduced by the Greeks into Italy and other countries bordering on the Mediterranean and into Persia and India. Subsequently the Romans laid the foundations of modern minting. Coining originated independently in China at a later date than in the Western world, and spread from China to Japan and Korea.

In Britain gold and silver were coined before the arrival of the Romans, and after the Norman Conquest the number of mints increased to about 70, more than now exist in the world. The necessity for so many mints arose from the imperfect means of communication. The coins were occasionally tested at Westminster, and if any deficiency in their weight or fineness was found the "moneyers" or minters were punished as traitors. About 1180, officers were appointed to supervise the coinage on behalf of the king and to collect the seigniorage (*q.v.*), which generally took the form of a deduction from the amount of bullion sent to the mint for coinage. The work was done by contractors at a great profit; Sir Isaac Newton, for example, amassed a fortune as master of the mint and contractor for the coinage. In 1850 the contract system was abolished and since then the work has been conducted by civil servants, all profits becoming part of the revenue. The London mint was built in 1810, when the old mint in the Tower of London was closed after being in use for centuries.

In the United States the Philadelphia mint was opened in 1792 and there are other mints at San Francisco and Denver, opened to provide markets for the gold produced near them. In most countries a single mint is found to be sufficient, but there are six in Germany and two in Australia. Many countries do not possess a mint, their coinages being executed under contract.

The Supply of Bullion to Mints.—In England, in the middle ages, the king was accustomed to send to the mint the produce of his own silver mines. The right of levying seigniorage was sometimes waived by the king to encourage his subjects to bring gold and silver to the mint, but in spite of this inducement supplies were often deficient, and several instances are recorded in which alchemists were called in to effect transmutation of baser metals into gold.

Silver bars, which usually weigh from 1,000 to 1,200 oz. troy each, are bought by the mints only when new or additional issues of silver coin are required for circulation or reserve. In the first years after the World War very little new silver was required for coinage in Britain, owing to the widespread melting down of old silver coin for sale and its replacement by base metal coins or by silver of lower standard. The intrinsic value of the silver in coins is usually much less than the nominal or face value at which they pass in circulation in their own country. Thus in Great Britain one ounce of a silver alloy containing 50% of silver is converted into 5s.6d. in silver coin, whatever may be the market price of silver bullion (in 1927 this was about 29d. per oz. of fine silver). The difference between the minted and unminted values is retained by the State to cover the cost of manufacture and as a source of revenue. The system in other countries is similar, but generally with less difference in value between the minted and unminted silver. Thus the United States dollar contains 371·2 grains or 0·77 oz. of fine silver.

Refined gold ingots suitable for minting (the "bar gold" of commerce) are usually about 400 oz. troy in weight. They could be taken to the London mint for coinage without charge previous to 1925, but in that year the right was withdrawn except from the Bank of England. The branch mints in Australia continue to receive unrefined gold from the mines for refining and coinage although at a small charge. In the United States, Canada, India and Japan the mints also receive unrefined gold and refine it.

Alloys Used in Coinage.—The earliest gold and silver coins made by the Greeks consisted of the pure metals (990–997 fine, *i.e.*, 990–997 parts in 1,000) or of electrum. After electrum had fallen into disuse, pure gold continued to be used, but under the Roman emperors copper was intentionally added and in the two centuries preceding the fall of Rome very base alloys of gold were coined, some containing only 2% of gold or even less. In the middle ages these base alloys were discarded and the "byzant" of Constantinople and the early coins of Western Europe were intended to be absolutely fine. The gold standard of $\frac{11}{12}$ or 916·6 (22 carats fine) was adopted in England in 1526 and remains unchanged.

The silver standard of 925 (11 oz. 2dwt. of silver and 18dwt. of alloy) was probably first introduced in England by the Saxons but has not been maintained continuously. Henry VIII. reduced it to 10 oz. silver and 2 oz. alloy and afterwards to 4 oz. silver and 8 oz. alloy. Under Edward VI. the standard, at first debased further to 3 oz. silver and 9 oz. alloy, was afterwards raised again, and the standard of 925 was restored by Elizabeth. In 1920 it was reduced to 500, but the name "standard silver" generally means silver 925 fine. The 900 standard for both gold and silver coins was introduced in France soon after the Revolution and was later adopted in most other countries. The standard in India is 916·6 for both gold and silver.

Copper was originally added to gold in coins to reduce the cost of metal, but it has long been recognized that gold-copper and silver-copper last longer in circulation than pure metals owing to their greater hardness. Rate of wear, however, does not depend entirely on hardness, but also on the resistance of coins to corrosion. Coins become greasy in circulation and the fatty acids corrode the copper, forming a friable crust on the surface which is easily rubbed off. Accordingly coins containing much copper are not so resistant to wear as those of higher standard and more often present a dirty appearance in circulation. The average life of silver coins of the 925 standard in circulation in Great Britain was about 40 years in the 19th century, the larger coins lasting longer and the smaller ones for a shorter time.

Subsidiary coins have in the past generally consisted of copper, but in France soon after the Revolution of 1789 copper became scarce and the church bells were melted down to eke out the supply. The bells consisted of an alloy of copper and tin with a little zinc and the coins containing some of it were found to have advantages over those of pure copper. A mixture of these metals in the proportion of copper 95%, tin 4%, zinc 1% ("coinage bronze") was adopted in 1851 by France for subsidiary coins and afterwards by almost every country in the world.

The copper-nickel alloy or "nickel-bronze" (consisting of copper 75%, nickel 25%) has been used since its introduction in Belgium in 1861. Aluminium-bronze (copper 91%, aluminium 9%) has been used instead of silver for francs and two-franc pieces in France since 1921 and has been adopted elsewhere.

Manufacture of Coins.—Until the middle ages coins were struck between engraved dies by hand hammers and hand minting persisted in the native States of India until the 19th century. The Romans cast their larger copper coins. Modern methods may be said to date from 1553 when rolls for reducing the thickness of cast bars, machines for punching-out round discs from sheets of metal, and screw presses for striking coins were introduced in Paris. In England the new machinery was tried in 1561 and finally adopted in 1662. (For a detailed account of the history of minting, *see* NUMISMATICS.)

The operations employed in the manufacture of gold and silver coin are as follows:—(1) Refining the metal to make it fit for coinage. Gold is refined at only a few mints and very little silver is refined even by these. (For a description of the processes, *see* GOLD: *Mining and Metallurgy* and SILVER: *Metallurgy*, etc.) (2) Melting the metal and casting it into bars. (3) Rolling the bars into strips or "fillets." (4) Cutting out discs or blanks from the strips. (5) Adjusting the weight of the blanks. (This is omitted in some mints.) (6) "Marking" or edge-rolling the blanks to

produce a raised rim or to impress a design on the edge. (7) Annealing the blanks and, in some mints, cleaning them in acid. (8) Striking the blanks between dies. (9) Weighing each coin.

Among the incidental operations are: (*a*) The valuation of the bullion, by weighing and assaying it. (*b*) "Rating" the bullion, or calculating the amount of copper to be added to make up the standard alloy. (*c*) Recovering the values from ground-up crucibles, ashes and floor sweepings (the mint "sweep"). (*d*) Assaying the melted bars. (*e*) "Pyxing" the finished coin, or selecting specimens to be weighed and assayed. (*f*) "Telling" or counting.

At the London mint about 2,750 oz. (86 kilograms) of gold are melted in a pot, but larger crucibles holding nearly 6,000 oz. (188 kilograms) are used for silver. The amount of metal to be melted in mints is small and its value great, so that small charges in the furnaces are convenient. The necessity for perfect uniformity in composition, discussed in the sequel, is also in favour of small charges. The cost of fuel is a small item and any loss of metal a serious matter. So crucible melting retains its place in mints.

The silver-melting furnaces employed in the London mint are cylindrical in shape inside and are heated by ordinary illuminating gas. The charge consists of refined silver bars with the required amount of copper, together with scrap silver from former operations and old coin if available. When ready for pouring, the crucible is lifted out of the furnace by means of circular tongs which are suspended from a travelling electric crane. The crucible is placed in a pouring cradle which can be tilted by gear wheels worked by a hand crank. The contents of the crucible are then stirred by a rotating mechanical stirrer in order to ensure proper uniformity of composition and a portion is dipped out for assay.

The limits of error allowed by law in the composition of gold and silver coins are narrow. In British gold coins the allowance or "remedy" for fineness is 2 per 1,000 of gold above or below the standard of 916·6. In most countries a divergence of only 1 per 1,000 of gold is allowed and little difficulty is experienced in keeping coins within the limits. Silver-copper alloys, however, even though perfectly mixed when molten, become of different composition in different parts on solidification. The only alloy of uniform composition when solid is that containing 720 parts of silver and 280 of copper. This is the "eutectic" alloy (*see* ALLOYS) and is used for coinage in Holland and Mexico.

Rolling.—The cast bars are reduced to the thickness of the coin by repeated passages between rolls, which are divided into breaking-down, thinning and finishing or gauging rolls, the last named being of the smallest diameter. The reduction of thickness in the bars is accompanied by a slight increase in their width and a very great increase in their length, so that it is generally necessary to cut them into two parts.

By repeated passages through the rolls the bars are hardened, and to facilitate further reduction they are usually softened by *annealing* before being passed to the finishing rolls. In some mints the strips are annealed. In the United States mints the use of very carefully refined metal has made it possible to discontinue the annealing. When the strips are reduced to the correct thickness they are examined by the "tryer," who cuts out one or two blanks from each strip with a hand machine and weighs them on a delicate balance. If the blank is too heavy the strip is again passed through the rolls.

The degree of accuracy required is indicated by the tolerance or "remedy" allowance in weight, which is different for each coin, and is the maximum difference from the standard weight which is allowed by law. In the sovereign it is 0·2 grain or about 1·62 per 1,000. As the mean thickness of a sovereign is 0·0466in. the remedy in weight corresponds to a difference of less than $\frac{1}{10,000}$in. in the thickness of the strip. Remedies in weight and fineness are intended to cover accidental variations.

Cutting and Marking Blanks.—In the cutting machine (fig. 1) the revolution of a cam causes two or more short steel cylinders or cutters to enter holes in two parallel plates fixed to the bed of the machine. When the coinage strip is brought between the plates, the cutters descend and force discs of metal through the holes in the lower plate. After each descent of the cutters, the strip is advanced by small gripping or feeding rolls to the next position. The discs fall down a tube to a receptacle.

The blanks are then passed to an edge-rolling machine, by which they are thickened at the edge so as to form a rim to protect the finished coin from wear. The operation is called marking, because originally the edges were not only thickened but were also marked with an inscription, as is still done in some mints. The letters are sometimes sunk and sometimes raised.

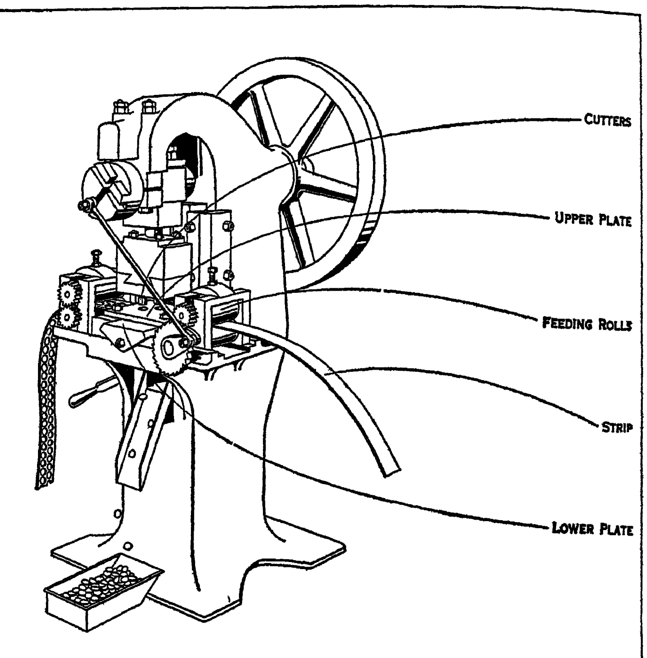

FIG. 1.—CUTTING MACHINE SHOWING HOW THE COIN BLANKS ARE PUNCHED, TWO AT A TIME, FROM THE STRIP OF SILVER BY THE DESCENT OF STEEL CYLINDERS

Like the graining or "milling" on the edges of coins, the inscriptions were intended to put a stop to the practice of clipping and filing coins, which was prevalent in the 16th and 17th centuries.

Annealing and Blanching the Blanks.—The blanks are next softened by annealing, and are then thoroughly cleaned before being passed to the coining presses. The blanks thus cleaned are charged into a hopper at one end of the furnace and conveyed towards the other end by a revolving Archimedean screw. In a few minutes they are raised to a dull red heat and become blackened by the formation on the surface of a film of oxide of copper. They leave the furnace by falling through an aperture into water. The oxide of copper is removed by solution in hot dilute sulphuric acid, sometimes with the addition of bichromate, and a layer of pure frosted silver is left on the surface, which appears dead white in colour, and has lost its metallic lustre. The operation is called "blanching." The blanks are washed in water to remove all trace of acid and are then dried.

Striking the Coins.—The blanks are converted into coin by receiving an impression from engraved dies. Each blank is placed on the lower of two dies and the upper die is brought down forcibly upon it. The pressure causes the soft metal to flow like a viscous solid, but its lateral escape is prevented by a collar which surrounds the blank while it is being struck. The collar may be plain, or crenated ("milled"), or engraved.

Modern coining presses are improved forms of the lever press invented by Uhlhorn in 1839 which replaced screw presses. One of the London mint presses is shown in fig. 2. The blanks are fed by hand or by an automatic feeder into the machine which performs the rest of the operations. A blank is carried forward by a moving slide and placed exactly on the lower die by iron fingers, the "layer-on." This imitates the action of the human finger and thumb which it has superseded. The collar encircles the blank and the upper die is brought down and pressed upon it. By means of continued revolution the machine next lifts the upper die, and the lower die rises simultaneously and pushes the coin out of the collar. Lastly the layer-on pushes off the finished

coin (which falls down a tube into a bowl) and places another blank on the die. Coining presses strike about 100 coins a minute.

The dies consist of hard carbon steel, and the process of making them is complicated. The original design of the artist, in the form of a large plaque of plaster of Paris, is reproduced in relief in iron or bronze by casting or in nickel by electro-deposition. An exact copy of the plaque in miniature, of the diameter of the coin to be produced, is made by a reducing machine.

The machine has two adjustable heads and on these are mounted

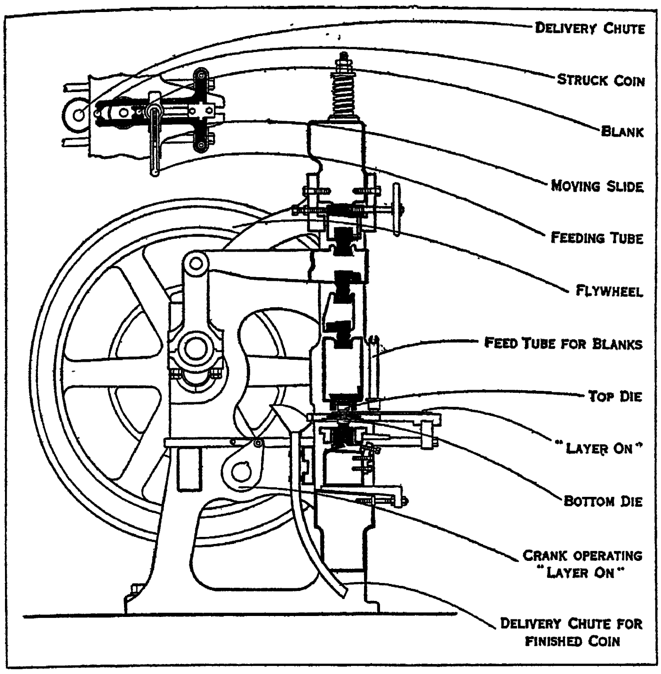

Fig. 2.—Coining press showing the massive structure of a modern press, which retains its rigidity while striking a heavy blow equivalent to a pressure of many tons

the model or plaque and a block of soft steel. In front of them is a balanced arm, pivoted at one end, and carrying both the tracer point, which presses against the model, and the revolving cutter. The model and steel block are rotated synchronously and at the same time the free end of the balanced arm is gradually raised. The result is that the tracer and cutter are made to travel in fine spirals over all parts of the model and steel block respectively, converting the block into the "reduction" punch.

The old way of making the original steel copy of the artist's design was by hand engraving (*see* Numismatics), a method still in use for slight changes in the design, as for example a change of date, and for all purposes in some mints.

Dies strike about 50,000 coins before they are worn out.

Weighing the Coins.—Gold and silver coins are examined individually by eye on the overlooking machine, upon which the coins are spread on a travelling belt, arranged so that both faces of the coins are exposed in succession. Each coin is then tested by ringing and finally weighed separately by being passed over delicate automatic balances. Automatic balances for weighing single coins were introduced at the Bank of England in 1843.

In the London mint both light and heavy coins are returned to the melting pot. The proportion of rejected gold coin varies with the quality of the bullion, and may exceed 10%. The percentage of rejected silver is usually less than 1%.

Trial of the Pyx.—Periodical examinations of the coins issued by the mint have been made from very early times in England by persons appointed by the Crown. Specimens are selected from the finished coins and are put into a box or "pyx." At intervals these coins are weighed and assayed by a skilled jury and the results reported to the Government. The trial is now held annually by the Company of Goldsmiths. (*See* also the article Money.)

Soc. of Arts*, London, 1884); *Annual Reports of the Deputy Master of the Mint* (London, 1870 onwards); *Annual Reports of the Director of the (United States) Mint* (Washington). (T. K. R.; H. W. L. E.)

MINT, botanically *Mentha*, a genus of plants of the family Labiatae, comprising about 25 species of perennial herbs, widely distributed throughout the temperate and sub-tropical portions of the globe, but chiefly in the temperate regions of the Old World. The species have square stems, opposite, aromatic leaves, and a stoloniferous creeping rootstock. The flowers are arranged in axillary clusters (cymes), which either form separate whorls or are crowded together into a terminal spike. The corolla is usually small and of a pale purple or pinkish colour; it has four nearly equal lobes, and encloses two long and two short stamens.

In Great Britain a number of species are indigenous or naturalized but the forms easily hybridize so that there is great confusion in the genus. *Mentha viridis* is the garden mint or spearmint (*q.v.*), which is commonly used for culinary purposes; it is distinguished by its smooth, sessile leaves and lax tapering flower-spikes. It is probably a cultivated race of the next species, *Mentha sylvestris,* which chiefly differs from the above in its coarser habit and hairy leaves, which are silky beneath, and in its denser flower-spikes. This plant is supposed to be the mint of Scripture, as it is extensively cultivated in the East; it was one of the bitter herbs with which the paschal lamb was eaten. *M. aquatica* grows in ditches, and is easily recognized by its rounded flower-spikes and stalked hairy leaves. *M. piperita,* or peppermint (*q.v.*), has stalked smooth leaves and an oblong obtuse terminal spike of flowers; it is cultivated for its volatile oil. *M. pratensis* belongs to a group which have the flowers arranged in axillary whorls and never in terminal spikes; it otherwise bears some resemblance to *M. viridis. M. Pulegium,* commonly known as pennyroyal, has small oval obtuse leaves and flowers in axillary whorls, and is remarkable for its creeping habit and peculiar odour. It was formerly popular for medicinal purposes. All the genus *Mentha* abound in a volatile oil, contained in resinous dots in the leaves and stems. Most mints blossom in August.

The name mint is also applied to plants of other genera, *Monarda punctata* being called horsemint, *Pycnanthemum linifolium* mountain mint, and *Nepeta Cataria* catmint.

MINTO, GILBERT ELLIOT, 1st Earl of (1751–1814), was the eldest son of Gilbert Elliot (1693–1766), Lord Minto. About 1763 Gilbert and his brother Hugh were sent to Paris, where their studies were supervised by David Hume and where they became intimate with Mirabeau. Gilbert entered Christ Church, Oxford, and was called to the bar. In 1776 he entered parliament as an independent Whig. He became very friendly with Burke, whom he helped in the attack on Warren Hastings and Elijah Impey, and on two occasions was an unsuccessful candidate for the office of speaker. In 1794 Elliot was appointed to govern Corsica, and in 1797 he assumed the additional names of Murray-Kynynmond and was created Baron Minto. From 1799 to 1801 he was envoy-extraordinary to Vienna, and having been for a few months president of the board of control he was appointed governor-general of India at the end of 1806. During his viceroyalty he had to provide against the danger from Napoleon, and deal with the nearer menace of the Sikh power at Lahore. Before he gave up office in 1813 Java and the Moluccas had been added to the Empire. He was then created Viscount Melgund and earl of Minto. He died at Stevenage on June 21, 1814 and was buried in Westminster Abbey.

See Hon. G. F. S. Elliot, *The Border Elliots and the Family of Minto* (Edinburgh, 1897); the article India: *History;* also the *Life and Letters of the first Earl of Minto, 1751–1806* (1874) and *Lord Minto in India, 1807–1814* (1880), both edited by the countess of Minto; and Sir J. F. Stephen, *The Story of Nuncomar and the Impeachment of Sir E. Impey* (1885).

MINTO, GILBERT JOHN ELLIOT-MURRAY-KYNYNMOND, 4th Earl of (1845–1914), was born in London on July 9, 1845. He was educated at Eton and Trinity College, Cambridge, and joined the Scots Guards in 1867. In 1870 he sent in his papers and went to live in Lincolnshire, where he acted as a gentleman rider for four years. He rode four times in the Grand National, and in the 1876 race he broke his neck. He survived,

and turned newspaper correspondent. In this capacity he was in Spain with the Carlist army in 1874, and in Turkey in the Russo-Turkish war. He was present in an unofficial way at the second Afghan war in 1879, and very nearly went to Kabul with Cavagnari's party who were murdered there next year. He went to the Egyptian war in 1882 in the same casual way, and fought with the mounted infantry at Ismailia.

He married Mary Grey in 1883, and the haphazard part of his life came to an end. In 1883 he went to Canada as military secretary to Lord Lansdowne; here he served in the Riel rebellion campaign and was offered the post of commandant of the North West Mounted Police. He returned to England in 1886, and spent twelve years at home, chiefly occupied with his volunteer corps, the Border Mounted Rifles, and studying the theory of warfare. In 1891 he succeeded his father as Lord Minto. In 1898 he was made Governor-General of Canada. Here his great problem was the difference in point of view between Chamberlain, with his vision of Imperial Federation, and Sir Wilfred Laurier, prime minister of Canada, whose vision, concentrated on Canada, included no such thing. Minto's invariably constitutional behaviour and his soothing personal influence helped to surmount some unpleasant situations, notably the Alaskan question and that of the Canadian contingent in the Boer war. Laurier said of him, "He is the most constitutional governor we have had."

Minto returned to England in November 1904, and in August 1905, he was appointed Viceroy of India in succession to Curzon. Curzon left him a ticklish legacy; he had changed many things in a very short time, and he had been an autocrat. Not the least of Minto's troubles was the tradition of centralisation he found; not the least of his assets were his great-grandfather's work a hundred years before, and India's long memory. Minto started at once to restore responsibility to the Viceroy's council. The relation between Minto and his secretary of State, Morley, was interesting. They liked and trusted one another personally, but Morley, as secretary of State, was a difficult man to handle. He tended for more than one reason, to be autocratic; he started by overriding his own council, he went on to ignore the Viceroy's council and to attempt to reduce the Viceroy himself to a satellite of the secretary of State. Minto handled the situation very cleverly; more than one of his suggestions, quietly thrown out in letters, came back to him in the majesty of Morley's somewhat Olympian despatches. But Morley's constant interference in the details of administration, raised a serious constitutional question, and very nearly provoked Minto's resignation. The breach with Kitchener that Curzon had left was immediately healed, and the two men worked together harmoniously in preparing India's case when the details of the Russian Convention were being arranged. Minto took a long step towards the solution of the frontier problem when he made a firm friend of the Amir of Afghanistan, who paid him a visit in Calcutta. But Morley was somewhat inclined to ignore views on the wider aspects of Imperial policy coming from India, and in the event of the Convention of 1907 nearly undid all Minto's work for the conciliation of the Amir.

But all other aspects of Minto's viceroyalty are of small moment compared with the supreme importance of the Reforms. (*See* India.) On this matter Minto and Morley saw eye to eye from the start. There were even times when the Tory Viceroy outran the prudence of the Radical secretary, and when the battle was won Morley said to Lady Minto, "I am swimming in a popular tide through victories which are not my own." In spite of strong opposition in India and at home the steps were gradually taken. The first was the appointment of an Indian member to the Secretary's Council; the second, much more hotly disputed, the appointment of Sinha to the Viceroy's council in March 1909. In May of the same year the Reform Bill was passed, the foundation of the new policy of gradual extension of self-government to India. Even Minto's enthusiasm for a progressive policy was perhaps not more to his credit than the determination with which, while he firmly suppressed sedition and violence, he refused to let them deter him from his chosen path. Lord Minto returned to England in Nov. 1910 and died at his home at Minto on March 1, 1914.

See J. Buchan, *Lord Minto*, 1924.

MINT PAR OF EXCHANGE. A mint par of exchange can only exist between two currencies based upon the same metal. It is defined as the fixed intrinsic value of the currency-unit of one country expressed in terms of the other. It depends solely upon the amount and fineness of the metal that the law of each country enacts what its currency-unit shall contain.

Thus, in England, 20 lb. gold, $\frac{11}{12}$ fine, equals £934·5; in Switzerland, 1kilog. gold, $\frac{9}{10}$ fine, equals Frs. 3,100; in the United States, 258 grains gold, $\frac{9}{10}$ fine, equals \$10.

The mint par of exchange can now be readily calculated. Take England and Switzerland:

$$
\begin{aligned}
\pounds 934{\cdot}5 &= \text{20lb. std. gold, } \tfrac{11}{12} \text{ fine.}\\
&= 18{\cdot}33 \text{ lb. fine gold.}\\
&= 6{\cdot}841 \text{kilogs. fine gold.}\\
\text{Frs.}3{,}100 &= \text{1kilog. gold, } \tfrac{9}{10} \text{ fine.}\\
&= {\cdot}900 \text{kilogs. fine gold.}
\end{aligned}
$$

$$\text{Then Frs. } \frac{3100 \times 6{\cdot}841}{{\cdot}9} = 6{\cdot}841 \text{kilogs. fine gold} = \pounds 934{\cdot}5$$

$$\text{or, Frs. } \frac{3100 \times 6{\cdot}841}{{\cdot}9 \times 934{\cdot}5} = \pounds 1$$

$$\text{or, simplifying, Frs. } 25{\cdot}22 = \pounds 1$$

Until 1928 the same formula applied to France.

Foreign exchange operators have a quicker way of calculating pars, known as "the chain rule." This is illustrated below, in the calculation of the pound against the dollar:

? dollars	=£1
£934·5	= 20 lb. gold std.
12 lb. std.	= 11 lb. fine.
1 lb. fine	= 5,760 grains fine.
9 grains fine	= 10 grains, $\frac{9}{10}$ fine.
258 grains, $\frac{9}{10}$ fine	= \$10.

Then the answer is:

$$\$ \; \frac{1 \times 20 \times 11 \times 5760 \times 10 \times 10}{934{\cdot}5 \times 12 \times 1 \times 9 \times 258} = \$4{\cdot}867$$

The chain rule is:

(1) State the question in the top equation.

(2) Begin each new equation with the same kind of item as ends the preceding one.

(3) See that the final equation ends with the same kind of item as began the first.

(4) Divide the product of the left-hand side into the product of the right.

(*See* also Currency; Foreign Exchange; Mint Price of Gold.) (N. E. C.)

MINT PRICE OF GOLD. In any form of metallic currency it is essential that the law should lay down the weight of metal that each coin should contain, as otherwise uniformity would be lost, and the currency would have no fixed value and purchasing power and would cease to command confidence. Furthermore, the law usually reserves the right to coin money to the official mint, which is a government institution. From this it follows that all gold or silver bullion which the holders wish to turn into coin has to be handed over to the mint in the form of bullion and returned by the mint in the form of coin.

The need for this double transfer immediately raises the question of the terms on which the mint is prepared to act. In these terms, three main factors are involved. These are the mint price of gold or silver, seigniorage and loss of interest.

Confining this examination to gold, it is clear that if, as is always the case, the weight and fineness of gold in each given coin is fixed by law the mint price of gold is equally fixed. Thus the English law lays down that twenty pounds weight troy of standard gold shall be coined into 934 sovereigns and one half-sovereign, and standard gold is defined as twenty-two carats fine gold to two carats of alloy in the pound weight troy, or eleven-twelfths fine.

The mint price of gold in England can thus be calculated at once:

$$
\begin{aligned}
\pounds 934{\cdot}5 &= \text{20 lb. standard gold}\\
&= \text{240 oz. }\;\text{"}\;\;\text{"}
\end{aligned}
$$

$$\therefore \text{1 oz. standard gold} = \pounds\frac{934{\cdot}5}{240} = \pounds 3 \text{ 17s. } 10\tfrac{1}{2}\text{d.}$$

£3 17s. 10½d., or—to use the form in which it is more usually expressed—77s. 10½d. per oz. standard, is the mint price of gold in London.

United States law enacts that a ten-dollar piece shall consist of 258 grains gold, nine-tenths fine. This makes the mint price of gold $20.67183 per oz. fine.

Having shown how the mint price is calculated, it remains to determine its significance. It simply expresses the amount of coin that the mint will return to the tenderer of a given amount of bullion. Thus in England if 20 lb. of standard gold are tendered to the mint the holder will receive back £934 10s.

It will be seen that, so far, the mint has made no charge for the cost of coining the gold. In England this was the case, but abroad the mint usually does make a charge. This is called seigniorage (*q.v.*) and it has the effect of reducing the mint price of gold.

The third point, namely loss of interest, arises from the fact that it usually takes a week or ten days for gold bullion to be minted. During this period the owner of the gold is earning no interest upon it. This also has a practical effect upon the mint price of gold, as can be seen very simply from the following calculation.

Assume that the operation of minting takes ten days, and that the current rate of interest is 5%. Then in London, one ounce standard gold equals 77s. 10½d. in ten days' time, which is only equivalent to 77s. 9d. spot cash.

The Bank and the Mint.—This fact has long had in London a curious result. Under the Bank Act of 1844 the Bank of England is bound to buy gold offered to it at a minimum price of 77s. 9d. per standard ounce. Hence, in practice, all bullion brought into England was not tendered to the mint for coinage, but sold outright to the Bank, who thus became in practice the sole tenderer of gold to the mint. This procedure was formally recognized by the Gold Standard Act of 1925, which lays down that only the Bank of England now has the right to tender gold to the mint for coinage. The London bullion market to-day is governed not by the mint price of gold, but by the fact that the Bank is to-day bound by law to buy gold offered to it at a minimum price of 77s. 9d. per standard ounce and to sell gold in bars of 400 ounces fine at a maximum price of 77s. 10½d. This keeps the market price between these two limits, and the Bank has "a turn" corresponding roughly to the loss of interest during minting. (*See* also CURRENCY.) (N. E. C.)

MINUCIUS, FELIX MARCUS, one of the earliest if not the earliest, of the Latin apologists for Christianity. He is now exclusively known by his *Octavius,* a dialogue on Christianity between the pagan Caecilius Natalis and the Christian Octavius Ianuarius, a provincial lawyer, the friend and fellow-student of the author. The form of the dialogue is modelled on the *De natura deorum* and *De divinatione* of Cicero.

The *Octavius* is admittedly earlier than Cyprian's *Quod idola dii non sint,* which borrows from it; how much earlier can be determined only by settling the relation in which it stands to Tertullian's *Apologeticum.* Since A. Ebert's exhaustive argument in 1868, repeated in 1889, the priority of Minucius has been generally admitted; the objections are stated in the *Dict. Chr. Biog.* article by G. Salmon. Editions: F. Sabaeus-Brixianus, as Bk. viii. of Arnobius (Rome, 1543); F. Balduinus, first separate edition (Heidelberg, 1560); Migne, *Patrol. Lat.* iii. 239; Halm in *Corp. Scr. Eccl. Lat.* (Vienna, 1867); H. A. Holden; Rausch (1913). Translations: R. E. Wallis, in *Ante-Nic. Fathers,* vol. iv.; A. A. Brodribb's *Pagan and Puritan.*

MINUET, a dance for two persons in ¾ time. At the period when it was most fashionable it was slow, ceremonious, and graceful (*see* DANCE). The name is also given to a musical composition written in the same time and rhythm. Haydn introduced it into the symphony; in Beethoven's hands it became the scherzo.

MINUIT, PETER (*c.* 1580–1638), Dutch governor of New Amsterdam and colonizer of New Sweden, was born of Dutch ancestry in Wesel, Rhenish Prussia, about 1580. He removed to Holland and in 1625 received the appointment of director-general of the Dutch West Indies Company's settlements in North America, known as New Netherlands, of which he became the first formal governor under the new government. He landed on Manhattan island on May 4, 1626, and sometime between July and September he called the native Indian chiefs into council and from them for merchandise valued at 60 guilders purchased the entire island, which he intended to make the centre of Dutch settlement. On its southern point he built a blockhouse, warehouse and mill, around which the early settlers made their homes. He ruled wisely until 1631 when he was recalled by the company because he had been too liberal in granting trading privileges to Dutch patroons, which the company feared would endanger their monopoly. A few years later he entered Swedish service and was given command of the two vessels of Swedish and Finn colonists which in March 1638, made the first settlement upon the Delaware river, near Wilmington, Del. There Minuit built Ft. Christiana and successfully managed the colonists' early relations with the Indians and the Dutch. In June 1638, he set out on a trading expedition to the West Indies and, when near the island of St. Christopher, the ship he was on was carried away in a sudden storm and never heard from again.

MINUSINSK, a town of Asiatic Russia in the Siberian area, in 53° 56′ N., 91° 40′ E., on the Minusinsk river, about 5 m. from its junction with the Yenisei. Pop. (1926) 20,403. The town is situated in the fertile Minusinsk district, which has rich black earth, where the warm dry summer enables spring wheat to ripen before the autumn frosts. The town has a flour-milling industry and exports about 4,000 tons of flour per annum to the Lower Yenisei. Sugar beet grows well and a sugar factory exists. Timber is floated down the river from the forests and saw-milling is one of the chief occupations of the town. The Tatar nomads of the Minusinsk steppes are noted stock-raisers. Before the settlement of Russians in the agricultural area after the 1907 Government survey they wandered over the whole region. The mineral wealth of the Minusinsk district is great, but is not yet much exploited. There are coal and copper beds, antimony is found in the rivers, Glauber's salt is obtained from the sulphate of sodium found near the left bank of the Yenisei river, and sulphate of soda from two small lakes lying between Achinsk and Minusinsk. The Minusinsk oasis, sheltered by the mountains, well watered and fertile, has been settled from time immemorial and is rich in the remains of the stone, bronze and iron age. Among the specimens collected in its fire-proof museum are a fine and representative collection of bronze implements, and relics of Chinese origin dating from the Han dynasty of the second century B.C. The collections were arranged by Prince Alexander Kropotkin and M. Martianov when they were exiled to Minusinsk in 1877.

MINUTE MEN, in the American War of Independence, militia-men who had undertaken to turn out for service at a minute's notice. In Massachusetts the minute men were enrolled by an act of the provincial congress of Nov. 23, 1774, and in Boston and vicinity were more prominent than elsewhere prior to the outbreak of the war. The Americans who fought in the opening action of Lexington were "minute men."

MIOCENE, in geology, the system of strata which occurs between the Oligocene and the Pliocene and thus forms the lower of the two divisions of the Neogene or newer Tertiary period. The term is derived from the Greek μεῖον, less, and καινός, recent, and was introduced by Sir Charles Lyell. The name indicates that the system has a smaller number of recent species than is found in the overlying Pliocene.

Conditions During the Miocene.—The close of the Oligocene was marked by a very general regression of the sea. The beginning of the Neogene, that is of the Miocene, was marked by a widespread marine transgression, followed later by a general regression. Thus the whole Miocene corresponds to a cycle of sedimentation, quite distinct from the Pliocene cycle which follows it. As in the Older Tertiary period the marine transgression took place in Europe from three directions—from the North sea, the Atlantic and the Mediterranean. The Miocene deposits are found in basins connected with each of these three areas.

The North sea of Miocene times was never as extensive as that of Eocene or Oligocene times, it did not invade the Paris basin and did little more than cover the fringes of eastern England, northern Belgium, Holland and northern Germany. The fauna is entirely different from that of the Mediterranean and correlation is difficult, especially as the North sea seems to have been cut off from the Atlantic by a ridge across the Straits of Dover.

The Atlantic washed the shores of France as it does to-day, and broad gulfs covered part of Brittany and Aquitaine, and there was a wide communication with the Mediterranean across the south of Spain.

The Mediterranean sea of Miocene times has left deposits which are the best known of all Miocene strata. The Alps had already been built up as far as general features are concerned, and the Miocene transgression was restricted to the surrounding peri-Alpine depression. From the Middle Miocene onwards the eastern Mediterranean was cut off from the western and also from the seas of India and the east. It became an inland sea with a specialized fauna.

Life of the Period.—From the beginning of the Miocene there is an entire difference between the faunas of the North sea and the Atlantic-Mediterranean, and it is difficult to give lists of characteristic fossils except for special areas. The fauna of the Atlantic-Mediterranean area is obviously the parent of the existing Mediterranean fauna. Amongst foraminifera nummulites give place to Lepidocyclines, many of large size. Amongst fossils of zonal importance echinoderms such as *Clypeaster, Scutella* and *Echinolampas* are especially abundant; amongst the numerous lamellibranchs and gastropods many species of *Pecten* are of very restricted vertical range. The important mammalian forms are noted below. For an account of the flora reference should be made to the article PALAEOBOTANY. It has been argued that the marked increase of herbivorous mammals in the Miocene, including *Hipparion,* was due to the spread of turf-forming grasses and that animal migration was greatly facilitated by the drying up of the Mediterranean.

Miocene Stratigraphy.—The following stages have been distinguished in the Mediterranean Miocene:

Marine Facies		Eastern European Facies
3 Sahelian		Pontian
2 Vindobonian	Torbonian facies Helvetian facies	Sarmatian
1 Burdigalian		. .

The *Burdigalian stage* is here taken as the base of the Miocene, since reasons have been given for regarding the Aquitanian as the highest Oligocene. (*See* OLIGOCENE.) The Aquitanian marks the beginning of the Miocene transgression, but contains a number of characteristic marine shells which are not found in later beds. The Burdigalian (type area Bordelais) is marked by a conspicuous transgression of the sea in the peri-Alpine region. Continental deposits of this age, notably the Orleanais sands, are marked by the appearance of such probroscideans as *Mastodon angustidens, M. turricensis, Dinotherium cuvieri,* of *Rhinoceros aurelianensis, Anchitherium,* etc.

The Vindobonian stage (type in the Vienna basin) is marked by further local transgressions such as in Bas-Dauphiné and in the enclosed Vienna Basin. The base of the stage, often of a sandy facies, has been designated the Helvetian (from the marine "mollasse" of Switzerland), whilst at the top there are sometimes blue marls with a deep-water fauna of *Pleurotomas*—a facies distinguished as Tortonian (from Tortona, Piedmont). In the continental equivalents, such as the deposits of Sansan and Simorre (Gers) and La Grive-St.-Alban (Isère) the characteristic mammals are *Mastodon angustidens, Dinotherium bavaricum, Rhinoceros sansaniensis, Dicrocerus elegans* and the last *Anchitherium.*

The Pontian Stage (from Pont-Euxin) consists of continental fluviatile or lacustrine deposits forming the final stage of the Miocene cycle. The Pontian includes the famous deposits of Pikermi near Athens and is distinguished palaeontologically by the appearance of *Hipparion, Mastodon longirostris,* the presence of *M. turricensis,* the last *Dinotherium; Rhinoceros schleiermacheri, Gazella deperdita.* Marine equivalents of the Pontian occur in certain parts of Algeria and have been called the Sahelian (after Sahel d'Oran). In eastern Europe where the huge stretch of the eastern Mediterranean was separated from the western the true Pontian is underlain by a brackish water series (the Sarmatian, from the country of the Sarmates in the south of Russia), which may be the equivalent of the upper Vindobonian.

Turning now to the North sea Miocene, the regression of the sea at the end of the Oligocene was such that the lowest Miocene is found only in Denmark, Schleswig-Holstein and the neighbourhood of Hamburg and is absent from England, Belgium and Holland. The middle Miocene is marked by a southward transgression, the sea reaching as far south as Bremen and Osnabrück in Germany and covering much of Belgium where ferruginous sands constitute the Bolderian (Bolderberg, near Hasselt, Belgium). The presence of Aquitanian fossils in the Bolderian suggests a connection with the Atlantic at this time. The upper Miocene is represented by glauconitic sands near Antwerp, the Anversian of the Belgians. It is still doubtful whether the Miocene is represented in England except by lavas and some interstratified beds on the west coast of Scotland and northern Ireland. A Miocene fauna is found in the "Boxstones" at the base of the East Anglian Pliocene and it is claimed on palaeontological grounds that part of the Lenham beds, occurring in pockets in the chalk downs of Kent and Surrey, is Miocene.

Outside Europe the Miocene is well displayed in parts of northern India (where the Gaj series is Burdigalian) and has yielded a rich harvest of mammalian remains (especially from the Bugti beds); in the old gulfs of south-eastern Asia it is partly marine, partly continental—including, for example, the upper part of the Peguan of Burma, whilst the lower part of the fresh-water Irrawaddian is Pontian. Along the Atlantic slope of the United States and around the Gulf of Mexico the complete Miocene series is present, the Sarmatian and Pontian occur also in California. Miocene rocks are important in the West Indies and the Antilles. (*See* under EOCENE.)

See the writings of G. E. Pilgrim in the *Records of the Geological Survey of India* on the correlation of Eastern deposits. (L. D. S.)

MIOT DE MÉLITO, ANDRÉ FRANÇOIS, COMTE (1762–1841), French statesman and scholar, was born at Versailles (Seine-et-Oise) on Feb. 9, 1762. He was a high official in the war office before the Revolution, and under the Republic he eventually became secretary-general for foreign affairs, and served on many foreign missions. In 1806 he joined Joseph Bonaparte in Naples as minister of the interior, afterwards following him to Spain as comptroller of the household, but he returned to France in the retreat of 1813. He took no part in politics after Waterloo. He was admitted in 1835 to the French Academy for his translations of Herodotus (Paris, 1822) and Diodorus (Paris, 1835–38). He died in Paris on Jan. 5, 1841.

See his diary covering the period 1788–1815, and published by his son-in-law, General von Fleischmann in 1858, Eng. trans. 2 vols., 1881. *See* also A. Gaudin, *Les Arrêtés, Miot* (Ajaccio, 1896).

MIQUEL, JOHANN VON (1829–1901), German statesman, was born at Neuenhaus, Hanover, on Feb. 19, 1829, being descended from a French family which had emigrated during the Revolution. He studied law at Heidelberg and Göttingen. The writings of Karl Marx converted him to socialism; but though he entered into correspondence with Marx, with the idea of starting a revolutionary movement, he took no open part in the events of 1848–49. He was one of the founders of the German *Nationalverein,* and in 1864 he entered the Hanoverian parliament as a Liberal and an opponent of the Government. He accepted the annexation of Hanover by Prussia without regret, and was one of the Hanoverians whose parliamentary abilities at once won a commanding position in the Prussian parliament, which he entered in 1867. He was burgomaster of Osnabrück from 1865 to 1870, and again from 1876 to 1879, being in the meantime (1870–73) a director of the Discontogesellschaft. In 1879 he was elected burgomaster of Frankfort-on-Main, where he dealt energetically with social questions, especially that of the housing of the poor. Probably owing to his early study of socialism, he was very ready to support the new state socialism of Bismarck. He was the chief agent in the reorganization of the National Liberal party in 1887, in which year he entered the imperial Reichstag. After Bismarck's fall he was Prussian minister of finance (1890–1900). He reformed the Prussian system of taxation, but failed in an attempt to reform the system of imperial finance in 1893–94. Miquel had

given up his Liberalism, and aimed at practical measures for improving the condition of the people irrespective of the party programmes; some of his measures—such as that for taxing "Waarenhäuser" (stores)—were of a very injudicious nature. He professed to aim at a union of parties on the basis of the satisfaction of material interests, a policy to which the name of *Sammlung* was given; but his enemies accused him of intriguing against the three chancellors under whom he served. His sympathy for the Agrarians increased his unpopularity among Liberals and industrials; he insisted that the State, which for half a century had done everything to help manufactures, might now attempt to support the failing industry of agriculture. He resigned in June 1901, and died on Sept. 8, at Frankfort.

Miquel's *Reden* were edited (4 vols., 1911–14) by Schultz and Thimme. *See* W. Mommsen, *Johannes Miquel* (vol. i., 1928).

MIRABEAU, ANDRÉ BONIFACE LOUIS RIQUETI, Vicomte de (1754–1792), nicknamed "Barrel Mirabeau," brother of the orator Mirabeau, was one of the reactionary leaders at the opening of the French Revolution. In 1789, he was elected by the noblesse of Limoges a deputy to the States General. He emigrated about 1790, and raised a legion which was to bear his name; but his insolence alienated the German princes, and his command was taken from him. He died in August 1792 at Freiburg im Breisgau.

See Joseph Sarrazin, *Mirabeau Tonneau, ein Condottiere aus der Revolutionszeit* (Leipzig, 1893); and Eugène Berger, *Le Vicomte de Mirabeau (Mirabeau Tonneau), 1754–1792* (1904).

MIRABEAU, HONORÉ GABRIEL RIQUETI, Comte de (1749–1791), French statesman, was born at Bignon, near Nemours, on March 9, 1749. The family of Riquet, or Riqueti, originally of the little town of Digne, won wealth as merchants at Marseilles, and in 1570 Jean Riqueti bought the château and seigniory of Mirabeau, which had belonged to the Provençal family of Barras. In 1685 Honoré Riqueti obtained the title of marquis de Mirabeau. His son Jean Antoine married Françoise de Castellane, and left at his death, in 1737, three sons—Victor, marquis de Mirabeau, Jean Antoine, bailli de Mirabeau, and Comte Louis Alexandre de Mirabeau. The great Mirabeau was the eldest surviving son of the marquis. When but three years old he had a virulent attack of small-pox which left his face disfigured, and contributed to his father's dislike of him. He was educated at a military school in Paris, and in 1767 received a commission in a cavalry regiment which his grandfather had commanded years before. He crossed his colonel in love, and the ensuing scandal led his father to ask for a *lettre de cachet,* and Mirabeau was imprisoned in the isle of Ré. This was the first recorded of many affairs of the heart. On his release, the young count obtained leave to accompany as a volunteer the French expedition to Corsica. After his return, he tried to keep on good terms with his father, and in 1772 he married a rich heiress, Marie Emilie de Marignane. His wild extravagance, however, forced his father to forestall his creditors by securing his detention in semi-exile in the country, where he wrote his earliest extant work, the *Essai sur le despotisme.* A violent quarrel brought another *lettre de cachet* and imprisonment in the Château d'If. In 1775 he was removed to the castle of Joux, to which, however, he was not very closely confined, having full leave to visit in the town of Pontarlier. Here he met Marie Thérèse de Monnier, the Sophie of the famous letters. He escaped to Switzerland, where Sophie joined him; they then went to Holland, where he lived by hackwork for the booksellers; meanwhile Mirabeau had been condemned to death at Pontarlier for *rapt et vol,* and in May 1777 he was seized by the French police, and imprisoned by a *lettre de cachet* in the castle of Vincennes.

The early part of his confinement is marked by the indecent letters to Sophie (first published in 1793), and the obscene *Erotica biblion* and *Ma conversion,* while to the later months belongs his political work, the *Lettres de cachet,* published after his liberation (1782). The book exhibits an accurate knowledge of French constitutional history skilfully applied in an attempt to show that an existing actual grievance was not only philosophically unjust but constitutionally illegal. It shows, though in rather a diffuse and declamatory form, that application of wide historical knowledge, keen philosophical perception, and genuine eloquence to a practical purpose which was the great characteristic of Mirabeau, both as a political thinker and as a statesman.

With his release from Vincennes (August 1782) begins the second period of Mirabeau's life. He found that his Sophie was an idealized version of a rather common and ill-educated woman, and she consoled herself with the affection of a young officer, after whose death she committed suicide. Mirabeau first set to work to get the sentence of death still hanging over him reversed, and by his eloquence not only succeeded in this but got M. de Monnier condemned in the costs of the whole law proceedings. From Pontarlier he went to Aix, where he claimed the court's order that his wife should return to him, but he lost his case by accusing his wife of infidelity, on which the court pronounced a decree of separation. He then intervened in the suit pending between his father and mother before the parlement of Paris, and attacked the ruling powers so violently that he had to leave France and again go to Holland. About this time began his connection with Mme. de Nehra, and his life was strengthened by the love of his *petite horde,* Mme. de Nehra, his adopted son, Lucas de Montigny, and his little dog Chico. After a period of work in Holland he went to England, where he was admitted into the best Whig literary and political society of London, through his old schoolfellow Gilbert Elliot. Among his most intimate English friends were the 1st marquess of Lansdowne, better known as Lord Shelburne, and Samuel Romilly. Romilly undertook to translate into English the *Considérations sur l'ordre de Cincinnatus,* which Mirabeau had written in 1785.

The *Considérations sur l'ordre de Cincinnatus* which Romilly translated was the only important work Mirabeau wrote in the year 1785. He now turned his thoughts to employment from the French foreign office, either in writing or in diplomacy. He first sent Mme. de Nehra to Paris to make peace with the authorities and then returned himself, hoping to be employed as a political pamphleteer, but he ruined his chances by a series of writings on financial questions. On his return to Paris he had become acquainted with Étienne Clavière, the Genevese exile, and a banker named Panchaud. From them he heard plenty of abuse of stock-jobbing, and seizing their ideas he began to regard stock-jobbing, or agiotage, as the source of all evil, and to attack in his usual vehement style the Banque de St. Charles and the Compagnie des Eaux. This last pamphlet brought him into a controversy with Beaumarchais, who certainly did not get the best of it, but it lost him any chance of literary employment from the government. But after a preliminary tour to Berlin at the beginning of 1786 he was despatched in July 1786 on a secret mission to the court of Prussia, from which he returned in January 1787, and of which he gave a full account in his *Histoire secrète de la cour de Berlin* (1789). He was in Berlin at the time of the death of Frederick the Great. He failed to conciliate the new king Frederick William; and thus ended Mirabeau's one attempt at diplomacy. During his journey he had made the acquaintance of Jakob Mauvillon (1743–1794), whom he found possessed of a great number of facts and statistics with regard to Prussia; these he made use of in his *De la monarchie prussienne sous Fréderic le Grand* (London, 1788). He had offered himself as a candidate for the office of secretary to the Assembly of Notables which the king had just convened, and to bring his name before the public published the *Dénonciation de l'agiotage.* The violence of this book ruined his chance of election, and he had to retire to Tongres; he further injured his prospects by publishing the reports he had sent in during his secret mission at Berlin. But 1789 was at hand; the states-general was summoned; Mirabeau's period of probation was over.

On hearing of the king's determination to summon the states-general, Mirabeau started for Provence, and offered to assist at the preliminary conference of the noblesse of his district. They rejected him; he appealed to the *tiers état,* and was returned both for Aix and for Marseilles. He elected to sit for Aix. At every important crisis his voice was heard in the Assembly, though his

advice was not always followed. He possessed at the same time great logical acuteness and the most passionate enthusiasm. From the beginning he recognized the need of strong government. At the same time he thoroughly comprehended that for a government to be strong it must be in harmony with the wishes of the majority of the people. He had carefully studied the English constitution in England, and he hoped to establish in France a system similar in principle but without any slavish imitation of the details of the English constitution. In the first stage of the history of the states-general Mirabeau's part was very great. He always knew his own mind, and was prompt in emergencies. To him is to be attributed the successful consolidation of the National Assembly. When the taking of the Bastille had assured the success of the Revolution, he warned the Assembly of the futility of passing fine-sounding decrees and urged the necessity for action. He declared that the famous night of Aug. 4 was but an orgy, giving the people an immense theoretical liberty while not assisting them to practical freedom, and overthrowing the old régime before a new one could be constituted. His failure to control the theorizers showed Mirabeau, after the removal of the king and the Assembly to Paris, that his eloquence would not enable him to guide the Assembly by himself, and that he must therefore try to get some support. He wished to establish a strong ministry, which should be responsible like an English ministry, but to an assembly chosen to represent the people of France better than the English House of Commons at that time represented England. The duchesse d'Abrantès states in her *Mémoires* that he thought of becoming a minister of the crown as early as May 1789, but the queen rejected the idea. He tried in vain to work with Lafayette, and then with Necker, for whose financial scheme he obtained the assent of the Assembly. After the events of the 5th and 6th of October the comte de la Marck consulted Mirabeau as to what measures the king ought to take, and Mirabeau, delighted at the opportunity, drew up an admirable state paper, which was presented to the king by Monsieur, afterwards Louis XVIII. The whole of this *Mémoire* should be read to get an adequate idea of Mirabeau's genius for politics; here it must be summarized.

The main position is that the king is not free in Paris; he must therefore leave Paris and appeal to France. "Paris n'en veut que l'argent; les provinces demandent des lois." But where must the king go? "Se retirer à Metz ou sur toute autre frontière serait déclarer la guerre à la nation et abdiquer le trône. Un roi qui est la seule sauvegarde de son peuple ne fuit point devant son peuple; il le prend pour juge de sa conduite et de ses principes." He must then go towards the interior of France to a provincial capital, best of all to Rouen, and there he must appeal to the people and summon a great convention. It would be ruin to appeal to the noblesse, as the queen advised: "un corps de noblesse n'est point une armée, qui puisse combattre." When this great convention met the king must show himself ready to recognize that great changes have taken place, that feudalism and absolutism have for ever disappeared, and that a new relation between king and people has arisen, which must be loyally observed on both sides for the future. "Il est certain, d'ailleurs, qu'il faut une grande révolution pour sauver le royaume, que la nation a des droits, qu'elle est en chemin de les recouvrer tous, et qu'il faut non seulement les rétablir, mais les consolider." To establish this new constitutional position, between king and people would not be difficult, because "l'indivisibilité du monarque et du peuple est dans le coeur de tous les Français; il faut qu'elle existe dans l'action et le pouvoir."

Such was Mirabeau's programme, from which he never diverged, but which was far too statesmanlike to be understood by Louis, and far too positive to be palatable to the queen. Mirabeau followed up his *Mémoire* by a scheme of a great ministry to contain all men of mark—Necker as prime minister, "to render him as powerless as he is incapable, and yet preserve his popularity for the king," the duc de Liancourt, the duc de la Rochefoucauld, La Marck, Talleyrand, bishop of Autun, at the finances, Mirabeau without portfolio, G. J. B. Target, mayor of Paris, Lafayette generalissimo to reform the army, Louis Philippe, comte de Ségur (foreign affairs), Mounier and I. R. G. le Chapelier. This scheme got noised abroad, and was wrecked by a decree of the Assembly of Nov. 7, 1789, that no member of the Assembly could become a minister. The queen utterly refused to take Mirabeau's counsel, and La Marck left Paris. In April 1790 he was suddenly recalled by the comte de Mercy-Argenteau, the Austrian ambassador at Paris, and the queen's most trusted political adviser, and from this time to Mirabeau's death he became the medium of almost daily communications between the latter and the queen. Mirabeau at first attempted again to make an alliance with Lafayette, but it was useless, for Lafayette was not a strong man himself and did not appreciate "la force" in others. From the month of May 1790 to his death in April 1791 Mirabeau remained in close and suspected, but not actually proved, connection with the court, and drew up many admirable state papers for it. In return the court paid his debts; but it ought never to be said that he was bribed, for the gold of the court never made him swerve from his political principles. He regarded himself as a minister, though an unavowed one, and believed himself worthy of his hire.

On the question of the veto Mirabeau declared for the king's absolute veto and against the compromise of the suspensive veto. On the question of procedure he got his friend Romilly to draw up a detailed account of the rules and customs of the English House of Commons, in the vain hope that the Assembly might adopt them. On the subject of peace and war he supported the king's authority, and with some success. Mirabeau almost alone of the Assembly held that the soldier ceased to be a citizen when he became a soldier; he must recognize that a soldier's first duty is obedience. Lastly in finance he attacked Necker's "caisse d'escompte," which was to have the whole control of the taxes, as absorbing the Assembly's power of the purse; and he heartily approved of the system of assignats, but with the reservation that they should not be issued to the extent of more than one-half the value of the lands to be sold.

Of Mirabeau's attitude with regard to foreign affairs something must be said. He held that the French people should conduct their Revolution as they would, and that no foreign nation had any right to interfere with them while they kept themselves strictly to their own affairs. But he knew that foreign monarchs were being prayed by the French emigrés to interfere on behalf of the French monarchy. To avoid any pretext for such interference was his guiding idea in foreign policy. He had been elected a member of the *comité diplomatique* of the Assembly in July 1790, and became its reporter at once. As matters became more strained, he entered into daily communication with the foreign minister, Montmorin, advised him on every point, and, while dictating his policy, defended it in the Assembly. How great a work he did is best proved by the confusion which ensued in this department after his death. For indeed in the beginning of 1791 his death was near. The excesses of his youth had weakened his strong constitution, and his parliamentary labours completed the work. Some time before the end he sent all his papers over to Sir Gilbert Elliot, who kept them under seal until claimed by Mirabeau's executors. Every care that science could afford was given by his friend and physician, Cabanis. The people kept the street in which he lay quiet, but medical care, the loving solicitude of friends and the respect of all the people could not save his life. When he could speak no more he wrote with a feeble hand the one word "dormir," and on April 2, 1791, he died.

No man ever so thoroughly used other men's work, and yet made it all seem his own. "Je prends mon bien où je le trouve" is as true of him as of Molière. His first literary work, except the bombastic but eloquent *Essai sur le despotisme* (Neufchâtel, 1775), was a translation of Robert Watson's *Philip II.*, done in Holland with the help of Durival; his *Considérations sur l'ordre de Cincinnatus* (London, 1788) was based on a pamphlet by Aedanus Burke (1743–1802), of South Carolina, who opposed the aristocratic tendencies of the Society of the Cincinnati, and the notes to it were by Target; his financial writings were suggested by the Genevese exile, Clavière. During the Revolution he received yet more help; men were proud to labour for him, and did not murmur because he absorbed all the credit and fame. Etienne Dumont, Clavière, Antoine Adrien Lamourette and Etienne Salomon Reybaz were but a few of the most distinguished of his collaborators. Dumont prepared famous addresses which Mirabeau used to make the Assembly pass by sudden bursts of eloquent declamation; Clavière worked out his figures, and wrote

his financial discourses; Lamourette wrote the speeches on the civil constitution of the clergy; Reybaz not only wrote for him his famous speeches on the assignats, the organization of the national guard and others, which Mirabeau read word for word at the tribune, but even the posthumous speech on succession to the estates of intestates, which Talleyrand read in the Assembly as the last work of his dead friend. He took other men's labour as his due, and impressed their words, of which he had suggested the underlying ideas, with the stamp of his own individuality; his collaborators were glad to help forward the Revolution through its greatest thinker and orator. As an orator his eloquence has been likened to that of both Bossuet and Vergniaud, but it had neither the polish of the old 17th century bishop nor the flashes of genius of the young Girondin. It was rather parliamentary oratory in which he excelled, and his true compeers are rather Burke and Fox than any French speakers. Personally he had that which is the truest mark of nobility of mind, a power of attracting love and winning faithful friends. (H. M. St.; X.)

Authorities.—The best edition of Mirabeau's works is that published by Blanchard in 1819–22, in ten volumes, of which the first two contain his *Oeuvres oratoires;* from this collection, however, many of his less important works and the *De la monarchie prussienne* are omitted. For details of his life consult *Mémoires biographiques, littéraires et politiques de Mirabeau, écrits par lui-même, par son père, son oncle et son fils adoptif,* which was issued by his adopted son, Lucas de Montigny (8 vols., 1834–35); *Correspondance entre Mirabeau et le comte de la Marck,* ed. A. de Bacourt (2 vols., 1851), some additional letters appeared in the German edition (3 vols., Leipzig, 1851–52). Other published correspondence is *Lettres de Mirabeau à Chamfort* (1796); *Lettres du comte de Mirabeau à Jacques Mauvillon* (Brunswick, 1792); *Lettres originales de Mirabeau, écrites du donjon de Vincennes, 1777–1780,* published by L. P. Manuel (4 vols., 1792); and, on the same subject, Paul Cottin, *Sophie de Monnier et Mirabeau d'après leur correspondance inédite* (1903); *Lettres à Julie,* edited by D. Meunier and G. Selois (Paris, 1903); *Lettres inédites* (1806), edited by J. F. Vitry. The *Histoire secrète* forms the basis of H. Welschinger's *La Mission secrète de Mirabeau à Berlin* (Paris, 1900). The most useful modern books are Louis and Charles de Loménie, *Les Mirabeau* (5 vols., 1878 and 1889); Alfred Stern, *Das Leben Mirabeaus* (2 vols., 1889); E. Rousse, *Mirabeau* (1891) in the Grands Ecrivains Français; A. Mézières, *La Vie de Mirabeau* (1892); L. Barthou, *Mirabeau* (1919); Meunier, *Autour de Mirabeau* (1926). On his eloquence and the share his collaborators had in his speeches *see* F. A. Aulard, *Orateurs de l'assemblée constituante* (1882). For his death *see* the curious brochure of his physician, Cabanis, *Journal de la maladie et de la mort de Mirabeau* (Paris, 1791, ed. H. Duchenne, Paris, 1890). English works include P. F. Willert, *Mirabeau* (1898) in the "Foreign Statesman" series; C. F. Warwick, *Mirabeau and the French Revolution* (1905); W. R. H. Trowbridge, *Mirabeau, the demi-god* (1907); H. E. von Holst, *The French Revolution Tested by Mirabeau's Career* (Chicago, 1894); and F. Fling, *Mirabeau and the French Revolution* (London and New York, 1908).

MIRABEAU, VICTOR RIQUETI, Marquis de (1715–1789), French author and political economist, father of the great Mirabeau, was born at Pertuis on Oct. 4, 1715. In 1728 he joined the army, but never rose above the rank of captain. After retiring from the army he wrote his *Testament politique* (1747), in praise of the middle ages. This was followed by *L'Utilité des états provinciaux* (1750), attributed at the time to Montesquieu; *L'Ami des hommes, ou traité de la population* (1756); written under the influence of Quesnay; *Théorie de l'impôt* (1760), a vehement attack on the farmers-general of the taxes. The last named book brought him imprisonment and exile to his estate at Bignon. There the Physiocratic School had its centre, and in 1765 Mirabeau bought the *Journal de l'Agriculture, du Commerce et des Finances* to serve as its organ. His health and his fortune were broken by a prolonged law-suit with his wife, in which his defence was undertaken by his son. The marquis died at Argenteuil on July 11, 1789.

See L. de Loménie's *Les Mirabeau* (2 vols., 1879). Also Oncken, *Der ältere Mirabeau und die oekonomische Gesellschaft in Bern* (Berne, 1886); H. Ripert, *Le Marquis de Mirabeau, ses théories politiques et économiques* [*thèse pour le doctorat*] (1901); De Lavergne, *Les Economistes français du 18me siècle.*

MIRACLE, anything wonderful, beyond human power, and deviating from the common action of nature, a supernatural event. The term is particularly associated with the supernatural factors in Christianity. To the Lat. *miraculum* correspond Gr. *τέρας* in the New Testament, and Heb. פֶּלֶא (Exod. xv. 11; Dan. xii. 6) in the Old Testament. Other terms used in the New Testament are *δύναμις* "with reference to the power residing in the miracle worker" (*cf.* גְבוּרָה Deut. iii. 24 and בְּרִיאָה Num. xvi. 30), and *σημεῖον* "with reference to the character or claims of which it was the witness and guarantee" (*cf.* אוֹת Exod. iv. 8); that the power is assumed to be from God is shown by the phrases *πνεύματι θεοῦ* (Matt. xii. 28; *cf.* Luke iv. 18) and *δακτύλῳ θεοῦ* (Luke xi. 20).

The two conceptions once common in the Christian church, that on the one hand miracles involved an interference with the forces and a suspension of the laws of nature, and that, on the other hand, as this could be effected only by divine power, they served as credentials of a divine revelation, are now generally abandoned. As regards the first point, it is now generally held that miracles are exceptions to the order of nature as known in our common experience; and as regards the second, that miracles are constituent elements in the divine revelation, deeds which display the divine character and purpose; that they are *signs* and not merely *seals* of truth. Various theories have been advanced which endeavour to discover the means by which the exceptional occurrence is brought about; but the explanation is merely hypothetical, and we are not helped in conceiving the mode of the divine activity in the working of miracles. The important consideration from the religious standpoint is that God's activity should be fully recognised.

An attempt has been made to discover a natural law which will explain some at least of the miracles of Jesus. Matthew Arnold (*Literature and Dogma,* pp. 143–144) and Harnack (*Das Wesen des Christentums,* p. 18) ascribe the healing miracles to the commanding influence of so great a personality as Jesus. While recent *psycho-therapy* (auto- or hetero-suggestion) lends some support to the theory it may be pointed out: (1) that the *nature* or *cosmical* miracles—feeding of the five thousand, stilling of the storm, withering of the fig-tree—are as well attested as the miracles of healing; (2) that many of the diseases, the cure of which is reported, are of a kind with which *moral therapeutics* could not effect anything (*see* Dr. R. J. Ryle in *Hibbert Journal* V. 586); (3) that Christ never failed to ascribe His power to the Father dwelling in Him. Should medical research prove that organic diseases as well as functional disorders, dependent on neurotic conditions, yield to such treatment, Jesus' use of the method in anticipation of this long development of medical science, would demand explanation. Even if it be shown that in His healing acts He was in His compassion for man, and confidence in God bringing into play hitherto unsuspected resources in Himself or in others, His transcendence personally of His age and surroundings would remain.

An attempt is made to get rid of the distinctive nature of miracle when the exceptionalness of the events so regarded is reduced to a *new subjective mode* of regarding natural phenomena. H. E. G. Paulus dismisses the miracles as "exaggerations or misapprehensions of quite ordinary events." A. Ritschl has been unjustly charged with this treatment of miracles. But what he emphasizes is on the one hand the close connection between the conception of miracles and the belief in divine providence, and on the other the compatibility between miracles and the order of nature. He declines to regard miracles as divine action contrary to the laws of nature. So for Schleiermacher "miracle is neither explicable from nature alone, nor entirely alien to it." What both Ritschl and Schleiermacher insist on is that the belief in miracles is inseparable from the belief in God, and in God as immanent in nature, not only directing and controlling its existent forces, but also as initiating new stages consistent with the old in its progressive development.

We may accept Dorner's definition as adequate and satisfactory. "Miracles are sensuously cognizable events, not comprehensible on the ground of the causality of Nature and the given system of Nature as such, but essentially on the ground of God's free action alone. Such facts find their possibility in the constitution of nature and God's living relation to it, their necessity in the aim of revelation, which they subserve" (*System of Chr.*

Doc. II. p. 161). By the first clause inward moral and religious changes due to the operation of the Spirit of God in man are excluded, and rightly so (*see* INSPIRATION). The negative aspect of miracles is that they are not explicable by the order of nature as we know it; the positive that owing to their character we are led to refer them directly to the divine causality. When the existence of God is denied (atheism) or His nature is declared unknowable (agnosticism), or He is identified with nature itself (pantheism), or He is so distinguished from the world that His free action is excluded from the course of nature (deism), miracle is necessarily denied. It is only the theistic view of God as personal power—that is as free-will ever present and ever active in the world,—which leaves room for miracles. Although the *possibility* of miracles is often confidently denied, such denial rests on an unproved assumption; since we do not know the continuity of nature so thoroughly as to be able to declare that this or that event is necessarily an interruption of it.

Lotze has shown, not only how the possibility of miracles can be conceived (*Mikrokosmos* III. 364); but even that the mode of the divine working may be made intelligible (*op. cit.* II. 54).

If we conceive God as personal, and His will as related to the course of nature analogously to the relation of the human will to the human body, then the laws of nature may be regarded as habits of the divine activity, and miracles as unusual acts which, while consistent with the divine character, mark a new stage in the fulfilment of the purpose of God.

The doctrine of Evolution, instead of increasing the difficulty of conceiving the possibility of miracle, decreases it; for it presents to us the universe as an uncompleted process, and one in which there is no absolute continuity on the phenomenal side; for life and mind are inexplicable by their physical antecedents, and there is not only room for, but need of, the divine initiative, a creative as well as conservative co-operation of God with nature. Such an absolute continuity is sometimes assumed without warrant; but Descartes already recognized that the world was no continuous process, "Tria mirabilia fecit Dominus; res ex nihilo, liberum arbitrium et hominem Deum." The theory of *psycho-physical parallelism* recognizes that while there is a correspondence between mental and material phenomena, changes in the mind and changes in the brain, the former cannot be explained by the latter, as the transition from the one to the other is unthinkable. William James distinguishes the *transmissive* function of the brain from the *productive* in relation to thought, and admits only the former, and not the latter (*Human Immortality* p. 32). Thus as life is transcendent and yet immanent in body, and mind in brain, and both utilize their organs, so God, transcendent and immanent, uses the course of nature for His own ends; and the emergence both of life and mind in that course of nature evidences such a divine initiative as is assumed in the recognition of the possibility of miracles. For such an initiative there must be adequate reason; it must be prepared for in the previous process, and it must be necessary to further progress.

The proof of the possibility of miracle leads us inevitably to the inquiry regarding the necessity or the sufficient reason of miracles. The necessity of miracles is displayed in their connection with the divine revelation; but this connection may be conceived in two ways. The miracles may be regarded as the *credentials* of the agents of divine revelation, as by Butler (*Analogy* part II. Chap. vii). This view, however, is now generally abandoned, for it is recognized that acts of superhuman power, even if established by adequate historical evidence, do not necessarily certify their divine origin. Their moral quality must correspond with the character of God; and they must be connected with teaching which to reason and conscience approves itself divine. The miracle and the doctrine mutually illuminate one another. Accordingly, the *credentials* must also be *constituents* of the revelation, as the character of Jesus ever shines through His miracles. The *wonders* and the *powers* are also *signs*. As God is the Saviour, and the chief end of the revelation is redemption, it is fitting that the miracles should be acts of divine deliverance from physical evil. This congruity of the miracle with divine truth and grace is the answer to Matthew Arnold's taunt about turning a pen into a pen-wiper or Huxley's about a centaur trotting down Regent Street.

The miracles of Jesus—the relief of need, the removal of suffering, the recovery of health and strength—reveal in outward events the essential features of His divine mission. The divine wisdom and goodness are revealed in the course of nature, but also obscured by it. The existence of physical evil, and still more of moral evil, forbids the assumption without qualification that the real is the rational. God in nature as well as in history is fulfilling a redemptive as well as perfective purpose, of which these miracles are appropriate signs. It is an unwarranted idealism and optimism which finds the course of nature so wise and so good that any change in it must be regarded as incredible. On the problem of evil and sin it is impossible here to enter; but this must be insisted on, that the miracles of Jesus at least express divine benevolence under those conditions in which the course of nature obscures it; and are therefore, proper elements in a revelation of grace, of which nature cannot give any evidence.

Having discussed the possibility and necessity of miracles for the divine revelation, we must now consider whether there is sufficient historical evidence for their occurrence. Hume maintains that no evidence, such as is available, can make a miracle credible. Mill states the position with due care. "The question can be stated fairly as depending on a balance of evidence, a certain amount of positive evidence in favour of miracles, and a negative presumption from the general course of human experience against them" (*Essays on Religion,* p. 221). The existence of "a certain amount of positive evidence in favour of miracles" forbids the sweeping statement that miracles are "contrary to experience." The phrase itself is, as Paley pointed out, ambiguous. If it means *all* experience it assumes the point to be proved; if it means only *common* experience then it simply asserts that the miracle is unusual—a truism. The *probability* of miracles depends on the conception we have of the free relation of God to nature, and of nature as the adequate organ for the fulfilment of God's purposes. If we believe in a divine revelation and redemption transcending the course of nature, the miracle as signs of that divine purpose will not seem improbable.

For the Christian Church it is the miracles of Jesus which are of primary importance. The Gospels assumed their present form between A.D. 60 and 90. Their representation of the moral character, the religious consciousness, the teaching of Jesus, inspires confidence. The narratives of miracles are woven into the very texture of this representation. In these acts Jesus reveals Himself as Saviour. In His sinless perfection and filial relation to God He is unique, and His works are congruous with His Person. Of the supreme miracle of His resurrection there is earlier evidence than of any of the others (1 Cor. xv. 3–7, before A.D. 58). His conquest of death is most frequently appealed to in the apostolic teaching. The Christian Church would never have come into existence without faith in the Risen Lord. Yet it must be remembered that the *fact* of the resurrection does not stand or fall with the *mode* in which it was conceived; and that the mode of a belief is necessarily dependent upon the pre-suppositions, scientific and religious, of the age in which it is held. The accounts in the Old Testament of miraculous events are obviously conditioned by the presuppositions of the age and would in most cases be recorded differently to-day. The supernatural element that is prominent in the Old Testament is regarded by the authors of its various books as God's providential guidance and guardianship of His people, and His teaching and training of them by His prophets.

In Roman Catholicism, in mediaeval as in modern times, the working of miracles has been ascribed to its saints; but the character of most of these miracles is such as to lack probability. Further, these records are imitative. As Christ and the apostles worked miracles, it is assumed that those who in the Church were distinguished for their sanctity would also work miracles; and there can be little doubt that the wish was often father to the thought.

MIRA DE AMESCUA, ANTONIO (1578–1644), Spanish dramatist, combined to a high degree creative power with evenness of execution. Two of his plays—*La Adversa fortuna de Don Bernardo de Cabrera* and *El ejemplo mayor de la desdicha y capitan Belisario*—are respectively the sources of Rotrou's *Don Bernardo de la Cabrère* and *Belisaire*. Moreto's *Caer para levantar* is simply a recast of Mira's *El Esclavo del demonio*, a celebrated drama which clearly influenced Calderón when composing *La Devoción de la cruz;* and there is manifestly a close relation between Mira's *La Rueda de la fortuna* on the one hand and Corneille's *Héraclius* and Calderón's *En esta vida todo es verdad y todo es mentira.*

MIRAGE, an optical illusion due to progressive variations in the refractive indices of adjacent layers of the atmosphere. It embraces the phenomena of the visionary appearance of sheets of water in arid deserts, the images of ships and icebergs in the atmosphere of the Polar regions, the *Fata Morgana,* and "looming" as witnessed in mists or fogs.

A ray of light, when traversing a homogeneous medium is deviated from its original path by any transparent medium of different refractive index which it enters at an angle less than a right angle; it is therefore readily seen that the path of a ray through continuously varying media is necessarily curved, being compounded of an infinite number of infinitesimally small rectilinear deviations. The atmosphere is a medium of continuously varying refractive index. Meteorological optical phenomena, caused by variations in the refractive index of the atmosphere, may be grouped as: (1) permanent variation as experienced during a normal ascent through the atmosphere, and (2) sporadic variations occasioned by irregular heating. The first variation necessitates the correction of astronomical observations and of geodetic measurements of heights; it is also important in the phenomena of the twilight (*q.v.*) and the afterglow. The second type of variation gives rise to mirages.

A common occurrence is the appearance of an isolated lake in hot sandy deserts. The sand, *e.g.,* of the Sahara, being abnormally heated by the sun, causes the neighbouring air to expand, and its density and refractive index, are diminished, the minimum value being attained in the lowest layers. It reaches a maximum at a certain height, and then decreases according to the permanent variation. Any object viewed across such a heated area is seen by two sets of rays: one set passing near the earth and assuming a path convex to the horizon, the second set more remote from the earth and concave to the horizon. The object will thus appear double for an inverted image is also seen as though mirrored by the sand. The sky's image appears as a sheet of water often surrounded by rocks, reeds and trees, all being reflections of actual objects but frequently distorted out of recognition. Similar mirages may often be seen over smooth surfaces, *e.g.,* tarred roads, on calm hot days, apparent pools of water flood the roadways and surrounding objects are reflected in them. For experimental verification of the phenomena *see* R. W. Wood, *Phil. Mag.* 1899.

A mirage, frequently observed at sea in high northern latitudes, is the appearance of ships and icebergs as if inverted and suspended in the clouds. In this case, a stratum of hot air is at some distance above the sea level, the rays of light near the horizon are practically horizontal, while those at greater elevations are concave. If the change in density is so great that only the upper rays reach the eye then inverted ships appear in the clouds, although nothing is visible on the ocean.

The *Fata Morgana,* of the Straits of Messina, consists of an apparent vertical elongation of an object situated on the opposite shore. The distribution of density resembles that attending a desert mirage, but the changes of refractive index are not so abrupt. The object is really viewed through horizontally stratified media consisting of a central sheet of maximum refractive index, over- and under-laid by sheets with decreasing refraction effects. The entire system acts as a lens, magnifying the object in a vertical direction. If, in addition to this type of horizontal stratification, the atmosphere possesses a similar vertical stratification, then the object would be magnified along two dimensions. These conditions sometimes prevail in misty or foggy weather, more particularly at sea, and thus give rise to the phenomena known as "looming." A famous land example is the "spectre of the Brocken" (*q.v.*). The chromatic halos which so frequently encircle these appearances are caused by diffraction (*see* HALO). Lenses formed of non-homogeneous material and having the maximum refractive index along the central axis, have been prepared, and reproduce some of the effects already described.

The mathematical explanation of this subject was first given by Gaspard Monge; *see* J. Pernter, *Meteorologische Optik* (1906); E. Mascart, *Traité d'optique* (1899–1903); R. W. Wood, *Physical Optics* (1905); R. S. Heath, *Geometrical Optics* (1887).

MIRAJ, a native state of India, in the Southern Mahratta States, Bombay. Since 1820 it has been subdivided between a senior and a junior branch. The territory of both is widely scattered among other native states and British districts. Area of the senior branch, 343 sq.m.; pop. (1921), 82,580; tribute £800. Area of the junior branch, 211 sq.m.; pop. (1921), 34,665, tribute £500. The chiefs are Brahmans of the Patwardhan family. The town of MIRAJ, at which the chief of the senior branch resides, is situated near the river Kistna; it is a junction of the Madras & Southern Mahratta railway for the branch to Kolhapur. Pop. (1921), 21,424. The chief of the junior branch has his residence at Bhudgaoh (pop. 3,305).

MIRAMON, MIGUEL (1832–1867), Mexican soldier of French extraction, was born in the city of Mexico, Sept. 29, 1832, and was shot with the Emperor Maximilian at Queretaro on June 19, 1867. While still a student he helped to defend the military academy at Chapultepec against the forces of the United States; and, entering the army in 1852, he rapidly came to the front during the civil wars. It was largely due to Miramon's support of the ecclesiastical party against Alvarez and Comonfort that Zuloaga was raised to the presidency; and in 1859 he was called to succeed him in that office. Decisively beaten by the Liberals in 1860, he spent some time in Europe advocating foreign intervention in Mexican affairs, and returned as a partisan of Maximilian. His ability as a soldier was shown by his double defence of Puebla in 1856.

MIRANDA, FRANCISCO (*c.* 1754–1816), Spanish-American soldier and adventurer, born at Carácas, Venezuela. After serving with the French in the American War of Independence, he began to plot for the independence of Spanish America, was discovered, fled to the United States and thence to England. He travelled to Austria, Turkey, Russia and back to England, always in the vain hope of finding material support for his scheme. In April 1792 he was in Paris; he distinguished himself under Dumouriez, was entrusted in 1793 with the siege of Maestricht and commanded the left wing of the French army at Neerwinden. Although he had given notice of Dumouriez's treachery, he was tried on May 12, acquitted and re-imprisoned till after the 9th Thermidor. He escaped after the *coup d'état* of Fructidor to England; disappointed in his efforts there, in the United States and in Paris—whence he was expelled—he equipped the "Leander" in 1806 at his own expense with the aid of two American citizens, Colonel W. S. Smith and Mr. S. G. Ogden, and backed by the English admiral, Sir A. Cochrane, landed near Carácas and proclaimed the Colombian republic. A false report of peace between France and England caused the English admiral to withdraw his support. In 1810 the events which brought about the Peninsular War had divided the authorities in Spanish America, and Miranda again landed, and declared a republic both in Venezuela and in New Granada or Colombia. Defeated by the Bourbon governor, the count of Monte Verde, he capitulated on July 26, 1812, on condition that he should be deported to the United States. The condition was not observed; Miranda was moved from dungeon to dungeon, and died on July 14, 1816, at Cadiz.

See Buchez et Roux, *Histoire parlementaire,* xxvii. 26–70 (for his trial); J. Biggs, *History of Miranda's Attempt in South America* (1809); Veggasi, *Revolución de la Colombia;* W. S. Robertson, *Francisco de Miranda and the revolutionizing of Spanish America* (1908); Marqués de Rojas, *El General Miranda* (1884), and *Miranda dans*

la révolution française (Carácas, 1889); R. Becerra, *Ensayo histórico documentado de la vida de Don F. de M.* (Carácas, 1896).

MIRANDOLA, a town of Emilia, Italy, province of Modena, 19½ m. N. by E. of Modena by rail (also on the main Bologna-Verona line), 59 ft. above sea level. Pop. (1921), 4,424 (town), 18,941 (commune). The Pico family held the town from the 14th century to 1710, Giovanni (b. 1463, d. 1494) being its ablest and most learned member (*see* PICO). S. Francesco contains some of their tombs.

MIRANHAN, an independent linguistic stock of South American Indians, so called from the Miranhas, one of its most important tribes. They live on the Cauinary river and between the lower Yapura and Putumayo rivers on the border between Brazil and Colombia. They are a barbarous, cannibalistic people, who perforated and enormously enlarged the nasal alae which could be put over the ears. The teeth are also filed and blackened. The men wear a tight belt of bast, with breech-clout, the women wear a bast skirt. They are a sedentary, agricultural folk, living in large, square houses, with clayed walls and gable thatched roof. Their hammocks are of palm-leaf fibre, very beautifully made, and are widely traded.

See C. F. P. von Martius, *Beiträge zur Ethnographie und Sprachenkunde Amerika's etc.* (Leipzig, 1867); T. Koch-Grüneberg, "Der Miranya" (*Verh. Berliner Gesellschaft für Anthropologie etc.*, vol. xlii., pp. 896–914).

MIRBEAU, OCTAVE HENRI MARIE (1850–1917), French dramatist and journalist member of the Goncourt Academy, was born at Trevières (Calvados) on Feb. 16, 1850. He was educated in a Jesuit school at Vannes, and at the University of Paris. He then became dramatic critic of the Bonapartist paper, *L'Ordre*. For a short time before 1877 he was *sous-préfet* and then *préfet* of Saint-Girons, but from that time he devoted himself to literature. In 1890 he began to write for the *Révolte*, but his anarchist sympathies were definitely checked by the murder of President Carnot in 1894. He married in 1887 the actress Alice Regnault. His first novel, *Jean Marcellin* (1885), attracted little attention, but he made his mark as a *conteur* with a series of tales of the Norman peasantry, *Lettres de ma chaumière* (1886). *Le Calvaire* (1887), a chapter of which on the defeat of 1870 aroused much rancour, was followed by *L'Abbé Jules* (1888), the story of a mad priest; by *Sebastien Roch* (1890), a bitter picture of the Jesuit school in which his own early years were spent; *Le Jardin des supplices* (1899); *Les Mémoires d'une femme de chambre* (1901); *Les Vingt-et-un jours d'un neurasthénique* (1902); and *Dingo* (1913), the story of a dog. His dramatic work is finer, and René Lalon has compared his social drama *Les Mauvais Bergers* (Théâtre Renaissance, 1897) with the work of Becque. Equally fine was his *Les Affaires sont les Affaires* (Théâtre Français, 1903), which was adapted by Sydney Grundy for Sir H. Beerbohm Tree in 1905. Some of his short pieces are collected as *Farces et moralités* (1904). He died in Paris on Feb. 16, 1917.

MIRFIELD, an urban district in the West Riding of Yorkshire, England, 4¾ m. N.E. of Huddersfield, on the L.M.S. railway. Pop. (1931), 12,099. It is situated on the river Calder, and is served by the Calder canal. It lies in the carpet and blanket manufacturing area, and the large industrial population is employed in these and in the woollen and cotton industries. There are numerous collieries, and an Anglican theological college.

MIRKHOND (1433–1498) [Mohammed bin Khāwandshāh bin Hahmūd] was born in 1433. From his early youth he applied himself to historical studies and literature in general. In Herāt, where he spent the greater part of his life, he gained the favour of that famous patron of letters, Mīr 'Alīshīr (1440–1501). At the request of Mīr 'Alīshīr, himself a distinguished statesman and writer, Mīrkhond began about 1474, in the quiet convent of Khilāsīyah, which his patron had founded in Herāt as a house of retreat for literary men of merit, his great work on universal history, *Rauẓat-ussafā fi sīrat-ulanbiā walmulūk walkhulafā* or *Garden of Purity on the Biography of Prophets, Kings and Caliphs.* He made no attempt at a critical examination of historical traditions, and wrote in a flowery and often bombastic style, but in spite of this drawback, Mirkhond's *Rauẓat* remains one of the most marvellous achievements in literature. The main portion of the last volume is probably the work of his grandson, the historian Khwāndamīr (1475–1534), to whom also a part of the appendix must be ascribed.

For accounts of Mirkhond's life *see* De Sacy's "Notice sur Mirkhond" in his *Mémoires sur diverses antiquités de la Perse* (Paris, 1793). Besides the lithographed editions of the whole work in folio (Bombay, 1853, and Teheran, 1852–56) and a Turkish version (Constantinople, 1842), the following portions of Mirkhond's history have been published by European Orientalists: *Early Kings of Persia*, by D. Shea (London, 1832) (Oriental Translation Fund); *L'Histoire de la dynastie des Sassanides*, by S. de Sacy (in the above-mentioned *Mémoires*); *Histoire des Sassanides (texte Persan)*, by Jaubert (Paris, 1843); *Historia priorum regum Persarum*, Persian and Latin, by Jenish (Vienna, 1782); *Mirchondi historia Taheridarum*, Persian and Latin, by Mitscherlik (Göttingen, 1814, 2nd ed., Berlin, 1819); *Historia Samanidarum*, Persian and Latin, by Wilken (Göttingen, 1808); *Histoire des Samanides*, translated by Defrémery (Paris, 1845); *Historia Ghaznevidarum*, Persian and Latin, by Wilken (Berlin, 1832); *Geschichte der Sultane aus dem Geschlechte Bujeh*, Persian and German, by Wilken (Berlin, 1835); followed by Erdmann's *Erläuterung und Ergänzung* (Kazan, 1836); *Historia Seldschuckidarum*, ed. Vullers (Giessen, 1837); and a German trans. by the same.

MIRROR, an optical instrument which produces images of objects by reflection. In ancient times it was merely a polished sheet of metal, and was called a speculum; in modern times a mirror is a sheet of polished glass silvered at the back.

If an object CD (fig. 1) is placed in front of a plane mirror AB, every ray such as CP, starting from a point C on the object and striking the mirror, will proceed after reflection along a line PQ, which if produced will pass through the point E, found by dropping a perpendicular CM on the mirror and producing it to a distance ME behind the mirror equal to the distance MC. For it is obvious that the triangles CAD and EAD will always be equal, and therefore that the angles at P which the rays CP and PQ make with the mirror will be equal. Thus to an eye at Q the appearance will be exactly the same as if the light had come from this point E, wherever the eye may be, so long only as the line EQ cuts the surface of the mirror. The image formed by a plane mirror is therefore optically perfect, and free from all aberration.

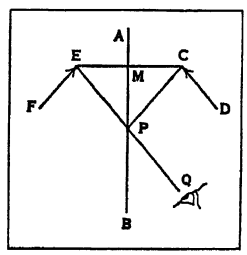

FIG. 1

The image of a solid object is not however a solid of the same shape as the object. For instance the image of a man's face may be imagined to be obtained by making a rubber mask of the face, and then everting it. The image will only be the same shape as the object if the face is perfectly symmetrical, right and left. (*See* LIGHT.)

Combination of Two Plane Mirrors.—If a beam of light, ABCD (fig. 2), is reflected in succession from two plane mirrors which are parallel to one another, as all the angles which they make with the normals to the mirrors are obviously equal to one another, the path of the light after the second reflection must be parallel to the original one AB. This final direction will therefore not be altered however the mirrors are turned about, provided only that the mirrors are kept parallel to one another. But the beam itself is displaced parallel to itself by an amount which depends upon the separation of the mirrors and the angle of incidence of the beam. Moreover any near object PQ seen by reflection will appear in a position P′Q′, found by drawing lines PP′, DD′, QQ′, from PQ parallel to the common normal NN′, and twice its length. By rotating the pair of mirrors round any axis parallel to PQ, the image P′Q′ can be made to describe the surface of a cylinder of which PQ is the axis.

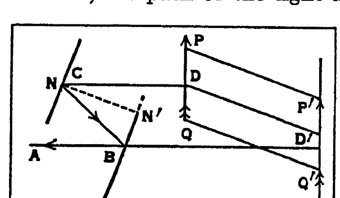

FIG. 2

If in fig. 2, we suppose the mirror B to remain still, and we rotate the mirror C by an angle ω, the ray CD will be turned through an angle 2ω, and the emergent beam will make this angle 2ω, with the incident beam. This angle between the two

beams is therefore independent of the angle of incidence of the original beam upon the first mirror, and will be unaffected by any movement or rotation of the pair of mirrors, so long as the angle between the mirrors is kept unchanged, and the line of intersection of their planes is kept parallel to itself.

A very important use of this property is made in the construction of the common sextant (*q.v.*).

Multiple Reflections.—If two parallel mirrors are set up facing one another and an object, *e.g.*, a candle, is placed between them, not only is this reflected by each mirror, giving two images, but each of these images is again reflected, and so on. In fact if the mirrors are strictly parallel there should be an infinite series.

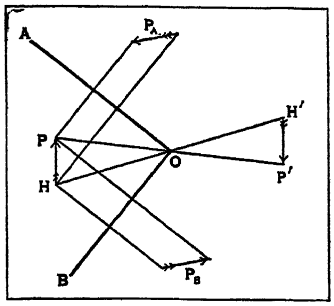

FIG. 3

Two mirrors at right angles yield some interesting effects. An object P (fig. 3) will give images P_A and P_B after one reflection in OA and OB respectively, and (if the angle AOB is exactly a right angle), a single image Q after two reflections. This image can be constructed by drawing lines from the several points of the object P, through O the line of intersection of the mirrors, and producing them to an equal length. It is then obvious that this image will not be affected by rotating the pair of mirrors about O. If the mirrors are set up in a vertical plane, with the line of intersection vertical, a person looking at himself in them, will find his right hand H reflected over to H′ on the left of the image as he sees it. If he moves to one side, the image moves to the opposite side, so that he can always see it while he remains within the angle AOB.

Optical Illusions.—Many optical illusions can be produced by the aid of plane mirrors, usually unsilvered or semisilvered or platinised ones are required. One of the commonest devices is to vary the illumination of the objects, of which some are placed behind and some in front of the mirror. An eye will see only one of these, if it is illuminated strongly and the other left dark.

Optical Illusions with a Concave Mirror.—A concave mirror AB′ A′B (fig. 4), will produce at QQ′ a real image of an object at PP′. If R and L are the right and left eyes of the observer, the right eye will see the image by rays coming from the portion BB′ of the mirror, and the left eye by those coming from the portion AA′. If therefore the mirror is large enough to extend from A to B, the image will be seen by both eyes as though the light were actually coming from an object at QQ′, and seems to be perfectly real and tangible. Thus an apple supported in a box UVWX (fig. 5) against a black velvet background, and lighted by a lamp L, can be projected by a concave shaving mirror among other fruit R on a plate CD. It will disappear if the observer moves to one side, or L is turned out.

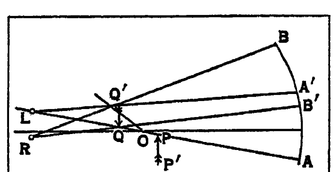

FIG. 4

Very striking effects are produced if water or mercury is allowed to run out from a tube, and splash into a glass dish; then if a second actual tube and glass dish are put to coincide with the images of the tube and dish, it will appear as if the liquid is falling upwards.

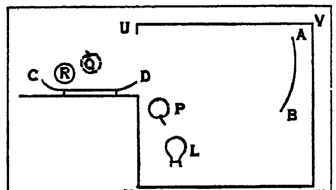

FIG. 5

The Tetrahedral Prism.—Let YOZ, ZOX, XOY, be three plane mirrors, mutually perpendicular, intersecting in OX, OY, OZ. Describe a sphere with centre O, and cutting the mirrors in great circles YZ, ZX, XY (fig. 6). Let a beam of light parallel to PO fall on the inside faces of these mirrors. Each of the mirrors will intercept and reflect part of the beam, which will then fall in turn on each of the other mirrors. Draw a great circle through XP, cutting YZ in M and measure MP′ equal to MP, the light reflected in the mirror YOZ will travel parallel to P′O after reflection. As the angle at M is a right angle, it is obvious that OP′ will make the same angles with OY and OZ that OP does, and that the angle it makes with OX is the supplement of that made by OP with OX. So reflection with any mirror changes the angle with the normal to that mirror into its supplement; successive reflection in all three mirrors will change all the angles made by OP with the normals OX, OY, OZ, into their supplements, *i.e.*, the beam will return exactly along its path.

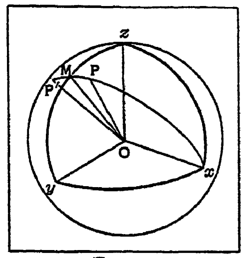

FIG. 6

As the final direction of the beam is simply the opposite of the original direction, it is not affected by rocking the system of mirrors. The mirrors are usually in the form of a tetrahedral prism, *i.e.*, corner of a cube cut off by a plane meeting the edges at equal distances from the corner. On looking into the prism each eye sees itself in a line with the vertex, and no change seems to take place when either eye is closed.

Astronomical Mirrors.—The earlier astronomical mirrors were made of speculum metal, but they were exceedingly difficult to cast owing to strains produced in cooling, and the surface was liable to be imperfect. For these reasons glass has been almost exclusively used for the large mirror since the discovery by Liebig of the method of front silvering it. Very large mirrors, ground from single slabs of glass, have been made successfully. Apparently the limit of size has been nearly if not quite reached, for it is doubtful if the annealing of much larger and thicker slabs would be possible. Professor Ritchey who was responsible for the construction and figuring of some of the largest mirrors, has recently, however, described a built-up cellular glass structure, by which he believes that mirrors up to as large as 30 feet in diameter could be made. An upper and a lower plate of glass of moderate thickness are connected together by vertical ribs of about the same thickness. This forms a structure of comparatively light weight and great rigidity, which will retain its form at all temperatures. He believes it should be sufficiently rigid to be ground and figured to the required degree of accuracy to form the optical image.

The first rough working of these mirrors may be done in one of several ways. They may be turned with a diamond; or they may be ground with a grindstone made of carborundum or alundum, both glass and stone being rotated; or an iron ring fed with grinding material may be used. This grinding tool is a disc of iron of about the same size as the mirror itself, and it is formed with a convex surface of the same radius of curvature as the mirror is to have. In any case the final grinding and smoothing are done with this tool, the mirror resting upon it, face down. After the whole surface has been brought to the desired curve, the rough grinding is complete. It next has to be "smoothed." The smoothing is produced by continuing the grinding with a series of finer and finer grinding materials. After the smoothing is finished the surface should be grey when dry, and appear perfectly free from any pits or scratches, even when it is examined with a magnifying lens. The next stage is the polishing, which is done with moist rouge (ferric oxide), washed to remove any coarse particles. For this part of the process the tool is covered with a thin layer of semi-elastic material, pitch mixed with ashes or wool.

During polishing the curve is checked at frequent intervals, first to see that it has been ground to the radius desired, and then to see if it is approaching the paraboloidal shape, which it has ultimately to reach; for this final change from the true sphere is usually all effected in the polishing. The method devised by Foucault is always used for these tests. A pin point of light is placed to one side of the centre of curvature of the mirror. If the mirror is a perfect sphere the reflected light will all pass through a point on the opposite side of the centre, and an eye at this point, or even a little further from the mirror but in a line with this point, will see the whole mirror filled with light. Also if a straight edge be moved up from one side to cut the beam at

this point, the whole mirror will darken uniformly.

If the mirror is not a perfect sphere, no point can be found at which the mirror can be made to darken uniformly; but if it is a surface of revolution points can be found at which given zones will darken all over at the same time.

To obtain a *flat* surface, it is necessary to work three mirrors, call them A, B, C. These are then tested in pairs by the "Newton's ring" method. If A and B touch all over, and B and C and also C and A, they must all three be flat.

Elliptic Mirrors (generated by the rotation of an ellipse about its major axis) have been successfully applied to cinematograph projection, and to "flood-arcs" for theatre lighting. The mirrors are made of glass, and are silvered at the back, and then copper-plated to protect the silver. The carbons between which the arc is formed are supported in the axis of the mirror, which is pierced in its centre to allow the positive carbon to pass through; the crater of the negative carbon faces the mirror, and is adjusted at its focus. An enlarged image of the crater would then be formed at the farther focus of the mirror; but before reaching this focus, the light passes through a concave lens, which further magnifies the image of the crater, so that it is now large enough to cover the whole of the picture to be projected, which is 0·7 by 0·9 inches. The picture thus becomes virtually a self-luminous one, and the light from it enters the projecting lens as a slightly divergent beam. This method of dealing with the light differs fundamentally from that in the ordinary projecting lantern.

Searchlight Mirrors.—Another very important application of the concave mirror is to the naval searchlight. Here it is required to project a nearly parallel beam, so that an intense light may be concentrated upon any desired distant object. The mirror must therefore have a paraboloidal figure, as this is the surface that has the property that a ray from the focus, striking the surface at any point, will be reflected in a direction parallel to the axis of the parabola. The parabola in this case must subtend a large angle at the focus, if it is to reflect the bulk of the light from the arc, and it will therefore differ greatly from the shape of a sphere. Thus the methods used to produce the parabolic mirror of a telescope (which only subtends a few degrees at its focus) cannot be used in this case. Such surfaces are difficult to grind.

To evade these difficulties, a French Colonel Mangin in 1774 described a very ingenious mirror made in the shape of a concavo-convex lens with spherical surfaces, silvered on the convex side. By a proper choice of the radii of the two surfaces, the mirror behaves as a parabolic one, and gives a nearly parallel beam. These mirrors were used for some twenty years, but they were expensive, very liable to be cracked by the heat, and of course would be shattered by a single bullet. Mirrors made of sheet metal, pressed or spun to the required curvature, and coated on the inside with silver or gold, or other reflecting metal, and polished, do not reflect so much light.

A method of grinding a glass mirror to have a surface with any desired conic section was patented by Schuckert in 1888. He uses a very small tool, which can therefore fit the surface with sufficient approximation, and is constrained to travel in a conic-section. Other ways have since been devised for obtaining a glass mirror of the required shape. (R. S. Cl.)

MIRROR-WRITING. That form of writing which, like an impression on blotting paper, is reversed and becomes legible on holding up to a mirror. It is often associated with left-handedness, may occur in all classes of persons, from the mentally deficient to the genius, may concern adults or children and may be conscious or unconscious (as in right-sided hemiplegia.) In unconscious instances, the explanation seems to be that the right-sided hemiplegic who writes with his left hand mirror-wise, has a derangement of the visual component of speech, and the patient is therefore subject to the independent activity of stored-up memories localized in the right hemisphere.

See M. Critchley, *Mirror Writing* (1928). (W. S. L.-B.)

MIRZAPUR, a city and district of British India, in the Benares division of the United Provinces. The city is on the right bank of the Ganges; pop. (1921), 54,994. The river front, lined with stone ghats or flights of stairs, mosques, Hindu temples and dwelling-houses of the wealthier merchants, is handsome; but the interior of the town is mainly composed of mud huts. Formerly it was the emporium of trade between central India and Bengal, which has now been diverted to the railways. It has European and Indian lac factories, and manufactures brass vessels and woollen carpets. The London Mission manages a high school and an orphanage. The municipal limits include the town of Bindhachal, an important centre of pilgrimage, with the shrine of Vindhyeshwari.

The District of Mirzapur extends into the Sone valley. Area, 4,368 sq. miles. It is crossed from east to west by the Vindhya and Kaimur ranges. A central jungly plateau connects these and separates the valley of the Ganges from that of the Sone. The part north of the Vindhyas is highly cultivated and thickly peopled, but the rest of the district consists largely of ravines and forests with a sparse population. The population in 1921 was 724,183. It comprises a large part of the hereditary domains of the maharaja of Benares and is revenue-free.

MISCARRIAGE, in its widest sense a going astray, a failure. In law, the word is used in several phrases; thus, a miscarriage of justice is a failure of the law to attain its ends. In the Statute of Frauds in the expression "debt, default or miscarriage of another," the word is considered to mean a species of wrongful act for the consequence of which the law makes a party civilly responsible.

In strict medical nomenclature miscarriage implies the birth of a non-viable foetus at or after the sixth month of pregnancy, parturition before that time being termed abortion. Where the child is viable, *i.e.*, at or after the seventh month of pregnancy, the condition is termed a premature birth. Popularly, a miscarriage implies birth of a non-viable foetus independent of the duration of pregnancy. Birth of a dead foetus of viable age is termed a "still-birth." (*See* Abortion.)

MISCEGENATION, a mixture or blending of two races (from Lat. *miscere*, to mix, and *genus*, race).

MISDEMEANOUR, the generic term used in English law to include all those offences against the criminal law which are not by common law or statute made treason or felony. In *Russell on Crimes* it is defined as a crime for which the law has not provided a particular name. The term misdemeanour includes not only all indictable offences below the degree of felony, some of them grave crimes, such as sedition, riot and perjury, but also the petty misdemeanours, which may be dealt with summarily by justices of the peace, and the most trifling breaches of local by-laws.

Numerous acts or omissions are punishable as "misdemeanours by interpretation." In other words, disobedience to the command or prohibition of a statute as a matter of public concern is indictable as a misdemeanour, even if the statute does not so describe it, unless the terms of the statute indicate that some other remedy alone is to be pursued. For some misdemeanours penal servitude may be imposed by statute. But as a rule the appropriate punishment is by fine or imprisonment, without hard labour or both, at the discretion of the court unless limited by a particular statute. The offender may also be put under recognizance to keep the peace and be of good behaviour.

At the present time the practical difference in English law between misdemeanour and felony lies in some matters of procedure, for instance, an arrest for misdemeanour may not be made without judicial authority except under specific statutory authority.

MISE, an Anglo-French term denoting originally a payment. The *Rotuli Misae* of John's reign, for example, record the king's current disbursements from day to day. In a more technical sense, the word is applied to the payments made by the county palatine of Chester to each new earl, and by the Welsh to each new lord of the Marches, or to a prince or king on his entry into the country. By transference of idea the word came early to mean the settlement of a dispute by arbitration or agreement, and in this sense is familiar in English history in the "Mise of Amiens," in January, and that of Lewes, in May 1264.

MISENUM, ancient port, Campania, Italy, about 3 m. S. of Baiae (*q.v.*) at the west end of the Gulf of Puteoli (Pozzuoli). Until the end of the Republic it was a favourite villa resort dependent on Cumae. Agrippa made the fine natural harbour into

the main naval station of the Mediterranean fleet (31 B.C.). In 890 it was destroyed by the Saracens. The harbour consisted of the outer basin, or Porto di Miseno, protected by moles, of which remains still exist, and the present Mare Morto, separated from it by a comparatively modern embankment. The town lay on the south side of the outer harbour, near the village of Miseno, where remains of a theatre and baths have been found. Remains of villas can also be traced; the largest of these, which occupied the summit of the promontory, belonged first to Marius, then to Lucullus, and then to the imperial house. Tiberius died in it.

MISERICORD or **MISERERE,** in architecture, a small bracket placed upon the under side of the folding seats of church choir stalls, to furnish a support or rest against which the priest or clerk can lean while still canonically standing. Its name comes from the fact that these brackets were supplied in pity for the arduous task of remaining constantly standing during long services. The misericords of the choir stalls in Gothic churches both in France and Italy are usually richly carved, often with grotesque figures.

MISHAWAKA, a city of St. Joseph county, Indiana, U.S.A., on the St. Joseph river and Federal highway 20, 90 m. S.E. of Chicago and 4 m. E. of South Bend. It is served by the Grand Trunk, the New York Central, and two industrial railways. Pop. (1920) 15,195 (85% native white); was 28,630 in 1930 by Federal census. It has large manufacturing industries, with an output in 1927 valued at $28,632,700. Chief among them are a rubber-regenerating plant, and factories making over 14,000,000 pairs of rubber and woollen boots, shoes and overshoes, 30,000 trunks, and large quantities of power-transmission machinery, sand-cutting and sand-blast equipment, trunks and machinery made to special order. Mishawaka was an Indian princess, and there was a village bearing her name on the site of the present city. In 1833 St. Joseph Iron Works was laid out on the south side of the river, and in 1836 Indiana City on the north side. In 1838 the two settlements, together with smaller hamlets, were incorporated as the town of Mishawaka, and in 1899 it was chartered as a city.

MISHMI, a hill tribe north of the Brahmaputra in Assam, India, divided into four groups, said to be endogamous, called Chulikata (crop-haired), Bebejiya, Taroan and Miju, the customs of the two last differing a little from those of the two former. These groups are divided into patrilineal exogamous septs. They claim to have reached their present habitat from the north, except one sept, which came from the south. Polygamy is allowed and a man's widows go to his heir. Headmen are chosen by heredity, qualified by wealth and personality. Offences within the sept are punished by the kindred, otherwise the blood-feud is resorted to and revenge obtained by killing or enslaving some member of the offender's sept. All use arrows poisoned with aconite, but, while the first two groups use the simple bow and cane helmets, the two latter use the cross-bow and no helmets. All believe in a home of the dead under ground, and all bury, but the Taroan and Miju dig up their dead after five days and burn them.

See O'Callaghan, *The Mishmis* (Assam Census Report, 1921), Apdx. B. II.

MISHNAH: *see* TALMUD.

MIŠIĆ, ZIVOJIN (1855–1921), Serbian statesman, was born July 7, 1855 at Struganik near Valievo, the son of well-to-do peasant parents. He passed through the old Artillery school in Belgrade and served in the Serbo-Turkish War of 1877 and the Serbo-Bulgarian War of 1885. During the Bosnian annexation crisis he became assistant chief-of-staff to Gen. Putnik; he also fought in the first and second Balkan Wars. When the Austrians invaded Serbia in Nov. 1914, Mišić was appointed to the command of the I. Army. His simple and unaffected heroism inspired his soldiers with confidence: and after the decisive victory of Rudnik early in Dec. the Austrians were driven out of Serbia.

Mišić, who had been created voivode after Rudnik, again served with distinction during the retreat of the Serbian Army in the winter of 1915. He resumed command of the I. Army on the Salonika front in Aug. 1917, and in June 1918 was made chief-of-staff. A convinced believer in the idea of Yugoslav unity, he promoted the efforts of the exiled Yugoslav committee to organize Yugoslav legions on every front. He died on Jan. 20, 1921.

MISIONES, a territory of northern Argentina, bounded north by Paraguay and Brazil, east and south by Brazil and west by Paraguay and the Argentine province of Corrientes. Its boundary lines are formed by the upper Paraná and Iguassú rivers on the north, the San Antonio and Pequiry-guassu streams on the east and the Uruguay river on the south. Area, 11,511 sq.m.; pop. (1914) 53,563, chiefly Indians and *mestizos.* The territory is a region of roughly-broken surfaces, divided longitudinally by low mountains, called the Sierra Imán and Sierra Grande de Misiones. The greater part of the country is covered with forest and tropical jungle. The temperature ranges from about 49° F for the coolest month, July, to around 77° for the warmest month, January. Its products are chiefly confined to *yerba mate* or Paraguay tea (*Ilex paraguayensis*), tobacco and oranges and other fruits. Communication with the capital is maintained by lines of steamboats running to Corrientes and Buenos Aires, and by a railway which has been built from Asunción in Paraguay to Buenos Aires, crossing the Paraná, Encarnación to Posadas, by ferry. Posadas (pop. [1914], 15,734), the capital, on the Paraná, officially dates from 1865. It is at the extreme west of the territory, and is the terminal port for the steamers from Corrientes.

MISKOLCZ, a Hungarian town situated on the eastern slope of the Bükk mountains, in the fertile valley of the Szinva. It is an old but thriving town that clearly reflects its position on the frontiers of several forms of religious expression in its Gothic, Roman Catholic, Eastern Catholic, Lutheran and Calvinistic churches. This aspect is closely connected with its function as a centre of contact for hill and plain, an activity further apparent in the four large annual fairs at which there is a large trade in cereals and flour, wine and fruit, cattle and hides and other agricultural products; in addition there are flour mills, tanneries, boot factories and porcelain works. Like many of the towns on or near the Hungarian plain it has suffered greatly at the hands of invaders, notably the Mongols in 1241–43, who killed about 85,000 Hungarians on the Mohi heath, south-west of the town, and during the Turkish wars in the 16th and 17th centuries, and has been devastated by fire three times, in 1781, 1843 and 1847. About 4 m. S.W. of the town are the warm springs and baths of Tapolcza. The population of Miskolcz (1920) is 56,982.

MISPICKEL or **ARSENOPYRITE,** a mineral consisting of iron sulpharsenide $FeAsS$; it contains 46% of arsenic, and is of importance as an ore of this element. Mispickel is an old name of German origin, and as *Mistpuckel* was used by G. Agricola in 1546. The crystals are orthorhombic; they are often prismatic in habit and the prism is usually terminated by the deeply striated faces of an obtuse dome. The colour is silver-white or steel-grey, with a metallic lustre, but it is often tarnished yellow; the streak is greyish-black. The hardness is $5\frac{1}{2}$–6, and the specific gravity 5·9–6·2.

Mispickel occurs in metalliferous veins with ores of tin, copper, silver, etc. It is occasionally found as embedded crystals, for example, in serpentine at Reichenstein, Silesia. In Cornwall and Devon it is associated with cassiterite in the tin-lodes, but is also found in the copper-lodes; it is the principal source of arsenious oxide, the "white arsenic" of commerce (*see* ARSENIC). The chief supplies are from Cornwall and Devon, Freiberg in Saxony, Canada and the United States.

MISPRISION, a term in English law, almost obsolete, used to describe certain kinds of offence. Thus we have misprision of treason and misprision of felony. But there is no misprision of misdemeanour.

Misprision of Treason is the concealment or keeping secret of high treason, and the punishment is loss of the profit of the lands of the offender during life, forfeiture of all his goods and imprisonment for life.

Misprision of Felony is the concealment or procurement of the concealment of a felony committed by another person, punishable on indictment by fine and imprisonment.

In the United States, misprision of treason is defined to be the crime committed by a person owing allegiance to the United

States, and having knowledge of the commission of any crime against them, who conceals and does not, as soon as may be, disclose and make known the same to the president or to some judge of the United States, or to the governor, or to some judge or justice of a particular state.

MISRULE, LORD OF, in mediaeval times the master of the Christmas revels. Probably J. G. Frazer (*Golden Bough* III.) is right in suggesting that the lord or abbot of misrule is the successor of the king of the Roman Saturnalia, who personated Saturn. Stow (*Survey*) writes: "In the feast of Christmas there was in the King's House . . . a Lord of Misrule . . . and the like had ye in the house of every nobleman of honour or good worship, were he spiritual or temporal." The mayor and sheriffs of London also had lords of misrule but by an act of Common Council (1555) their expenses were severely curtailed. These mock-monarchs began their reign on Allhallows Eve, and misruled till Candlemas. In Scotland they were known as "Abbots of Unreason," and in 1555 a special Act suppressing them was passed. In Tudor times their reign was marked by much expense.

MISSAL, the book containing the liturgy, or office of the mass (*missa*), of the Roman Catholic Church. The earlier *Sacramentary,* the book used by the celebrant at the altar, contained merely the fixed canon of the mass or consecration prayer and the variable collects, *secretae* or *orationes super oblata,* prefaces, and post-communions for each fast, vigil, festival or feria of the ecclesiastical year; for a due celebration of the Eucharist other books were required for use by the choir, deacon and subdeacon, viz., the *Antiphonarium Missae,* afterwards called the *Graduale,* containing the proper antiphons (introits), responsories (graduals), tracts, sequences, offertories, communions and other portions of the communion service designed to be sung by the schola or choir, and the *Lectionarium* (or *Evangeliarium* and *Epistolarium*) with the proper lessons. But as the custom grew, from the 8th century onwards, of private celebrations in which the priest had to say the whole service the contents of these separate books came by degrees to be combined in a single volume, the *Missale plenum.* All modern missals are of this last description. The *Missale romanum ex decreto ss. concilii tridentini restitutum,* now in almost exclusive use throughout the Latin obedience, owes its present form to the council of Trent, which undertook the preparation of a correct and uniform liturgy, and entrusted the work to a committee of its members. This committee had not completed its labours when the council rose, but the pope was instructed to receive its report when ready and to act upon it. The "reformed missal" was promulgated by Pius V. on the 14th of July 1570, and its universal use enjoined, the only exceptions being churches having local liturgies which had been in unbroken use for at least two centuries. It has subsequently undergone slight revisions under Clement VIII.(1604), Urban VIII. (1634) and Leo XIII.(1884), and various new masses, both obligatory and permissive, universal and local, have been added. The Roman, like all the Western liturgies, is distinguished from those of the Eastern Church by its flexibility. A distinctive character has been given to the office for each ecclesiastical season, for each fast or festival of the year, almost for each day of the week; and provision has also been made of a suitable communion service for many of the special occasions both of public and of private life.

The meagre liturgical details furnished by the *Sacramentarium gregorianum* are supplemented by the texts of the *Ordo romanus,* the first of which dates from about the year 770. The ritual they enjoin is that for a pontifical high mass in Rome itself; but the differences to be observed by a priest *quando in statione facit missas* are comparatively slight. The Gregorian *Antiphonarius sive gradualis liber ordinatus per circulum anni,* as its name implies, contains those variable portions of the mass which were intended to be sung by the schola or choir. It gives for each day for which a proper mass is provided: (1) the *Antiphona* (Antiphona ad Introitum) and *Psalmus;* (2) the *Responsorium* and *Versus,* with its *Alleluia* and *Versus;* (3) the *Offertorium* and *Versus;* (4) the *Communio* and *Psalmus.*

The first pages of the modern Roman missal are occupied with the *Calendar* and a variety of explanations relating to the year and its parts, and the manner of determining the movable feasts. The general rubrics (*Rubricae generales missalis*) follow, explaining what are the various kinds of mass which may be celebrated, prescribing the hours of celebration, the kind and colour of vestments to be used, and the ritual to be followed (*ritus celebrandi missam*), and giving directions as to what is to be done in case of various defects or imperfections which may arise. The *Praeparatio ad missam* and *Gratiarum actio post missam* which comes next, are in a short manual of devotion to be used as opportunity may occur before and after celebration. Next comes the proper of the season (*Proprium missarum de tempore*), occupying more than half of the entire volume. It contains the proper introit, collect (one or more), epistle, gradual (tract or sequence), gospel, offertory, secreta (one or more), communion and post-communion for every Sunday of the year, and also for the festivals and ferias connected with the ecclesiastical seasons, as well as the offices peculiar to the ember days, Holy Week, Easter and Whitsuntide. Between the office for Holy Saturday and that for Easter Sunday the ordinary of the mass (*Ordo missae*), with the solemn and proper prefaces for the year, and the canon of the mass are inserted. The proper of the season is followed by the proper of the saints (*Proprium sanctorum*), containing what is special to each saint's day in the order of the calendar, and by the *Commune sanctorum,* containing such offices as the common of one martyr and bishop, the common of one martyr not a bishop, the common of many martyrs in paschal time, the common of many martyrs out of paschal time, and the like. A variety of masses to be used at the feast of the dedication of a church, of masses for the dead, and of votive masses (as for the sick, for persons journeying, for bridegroom and bride) follow, and also certain benedictions. Most missals have an appendix also containing certain local masses of saints to be celebrated *ex indulto apostolico. See* MASS: VESTMENTS.

MISSI DOMINICI, the name given to the officials commissioned by the Frankish kings and emperors to supervise the administration of their dominions. Their institution dates from Charles Martel and Pippin the Short, who sent out officials to see their orders executed. When Pippin became king in 754 he sent out *missi* in a desultory fashion; but Charlemagne made them a regular part of his administration, and a *capitulary* issued about 802 gives a detailed account of their duties. They were to execute justice, to enforce respect for the royal rights, to control the administration of the courts, to receive the oath of allegiance, and to supervise the conduct and work of the clergy. They were to call together the officials of the district and explain to them their duties, and to remind the people of their civil and religious obligations. In short they were the direct respresentatives of the king or emperor. The inhabitants of the district they administered had to provide for their subsistence, and at times they led the host to battle. In addition special instructions were given to various *missi,* and many of these have been preserved. The *missi* were not permanent officials, but were generally selected from among persons at the court, and during the reign of Charlemagne personages of high standing undertook this work. They were sent out in twos, an ecclesiastic and a layman, and were generally complete strangers to the district which they administered. Even under Charlemagne it was difficult to find men to discharge these duties impartially, and after his death in 814 it became almost impossible. Under Louis I. the nobles interfered in the appointment of the *missi,* who, selected from the district in which their duties lay, were soon found watching their own interests rather than those of the central power. Their duties became merged in the ordinary work of the bishops and counts, and under Charles the Bald they took control of associations for the preservation of the peace. About the end of the 9th century they disappeared from France and Germany, and during the 10th century from Italy.

See G. Waitz, *Deutsche Verfassungsgeschichte* (Kiel, 1844); E. Dobbert, *Ueber das Wesen und den Geschäftskreis der missi dominici* (Heidelberg, 1861); L. Beauchet, *Histoire de l'organisation judiciaire en France, époque franque* (1865); V. Krause, *Geschichte des Institutes der missi dominici* in the *Mittheilungen des Instituts für österreichische Geschichtsforschung,* Band XI. (Innsbruck, 1880); E.

Bourgeois, *Le Capitulaire de Kiersy-sur-Oise* (1885); N. D. Fustel de Coulanges, *Histoire des Institutions politiques de l'ancienne France* (1889–90).

MISSIONS, is the term used to denote organized efforts for the spread of a religion, those who carry out the work being known as missionaries. Both "missions" and "missionaries" have hence come to be used of similar propagandist work in other spheres (*e.g.*, "a missionary of peace"). Not only Christianity, but also Buddhism, Zoroastrianism and Islam are, or have been, missionary religions. The phrase "foreign missions" customarily used indicates that the work is carried on in countries which are foreign relatively to those from which it emanates, though the increasingly equal partnership of the younger Churches of the East and Africa with the older Churches of the West tends to render the words "foreign missions" slightly misleading. The history of Christian missions may, for practical purposes, be divided into three chief periods: (1) the primitive, (2) the mediaeval, and (3) the modern.

THE PRIMITIVE PERIOD

Christian missions begin with Jesus Christ, in whom the universalistic religion found in the nobler Judaism (*e.g.*, in "second" Isaiah, some of the Psalms and Jonah) achieved its fulfilment. In His person, work and teaching the unity, holiness, and love, of God, the forgiveness of sins, the ideal of human conduct and the divine order into which the world is to be transformed, are all expressed freed from local and racial limitation. The initial failure of the Palestinian Church to see the universal character of the Christian message was forgotten in the spontaneous movement of expansion in which Stephen, Philip and Barnabas led, followed by the greatest of all missionaries, the apostle Paul, who evangelized a large part of Asia Minor and the most important cities of Greece. The refusal of Paul to bind upon the Gentile converts Jewish customs such as circumcision marked a decisive movement in Christian history. From this point Christianity pushed its way rapidly into all the great centres of population. We should remember the great number of Greek Jews converted at Pentecost (Acts ii.), and scattered subsequently to the ends of the Roman world.

A famous testimony to the spread of Christianity is that of the younger Pliny, who in his letter to Trajan (A.D. 112) records that Christianity had taken such a firm hold of the province that its influence had penetrated to remote country districts, pagan festivals were almost entirely neglected, and animals for sacrifice could hardly find purchasers. Harnack in his *Expansion of Christianity* estimates the hold obtained by Christianity in the countries of the Roman Empire at the end of the third century as follows: (1) Christians numbered nearly one half of the population and Christianity was the standard religion of the people in most of Asia Minor, in the part of Thrace that lay over against Bithynia, in Armenia and in the city of Edessa. (2) Christianity claimed a very material part of the population, influenced the leading classes and held its own with the other religions in Antioch and Crete, Syria, Cyprus, Alexandria together with Egypt and the Thebais, Rome and lower Italy, parts of central Italy, Proconsular Africa and Numidia, Spain, the maritime parts of Greece, and the southern coasts of Gaul. (3) Christians were sparsely scattered in Palestine, Phoenicia, Arabia, certain parts of Mesopotamia, the interior districts of Greece, the provinces in the north of Greece, the northern part of central Italy, and the provinces of Mauretania and Tripolis. (4) Christianity was weak or barely existent in the regions to the north and north-west of the Black Sea, the western part of upper Italy, middle and upper Gaul, Belgium, Germany, Rhoetia and the towns of ancient Philistia.

After the end of the third century missionary enterprise was carried on chiefly on the borders of the Empire. Among the most famous missionaries of this period were Gregory the Illuminator, the apostle of Armenia, about A.D. 300, Ulfilas the apostle of the Goths, about 325, Chrysostom, who founded at Constantinople in A.D. 404 a training school for native Gothic evangelists, Martin of Tours, who evangelized central Gaul, and Patrick, a Scot or Briton, who was taken to Ireland a captive, escaped and became a monk in France, returned to Ireland as a missionary and is traditionally held to be the man who made Ireland the "isle of saints."

THE MEDIAEVAL PERIOD

Celtic Missionaries.—The passionate zeal of the Celtic missions has never been surpassed in Christendom. The men came from the Celtic Churches of the Scottish Highlands and Ireland, out of a Christianity that is probably a legacy of the Roman occupation of Britain. Their missionary passion owed little to the central organization of Rome. Columba, the founder of the monastery of Iona in A.D. 563, an Irishman who was to pay back the debt Ireland owed to Scotland in Patrick, was the leader, and he was followed by Aidan who evangelized Northumbria, Columban who preached in the Vosges and to the Burgundians, Callich (St. Gall) the apostle of Switzerland and many others. Their work ranged from Switzerland and the Rhine to the Faröes and Iceland.

Missions from Rome as Centre.—The work of the Celtic missionaries proved lacking in permanency, and the work of later missionaries was directed from Rome and drew on other races in order to supplement the wonderful pioneering of the Celts. The English missionaries, Wilfrid, Willibrord, and, most famous of all, Winfrid or Boniface, the apostle of Germany, representatives of a newly evangelized Church, went in the seventh and eighth centuries to the Low Countries, Friesland, Saxony, Upper Hessia, Thuringia. Anskar (801–865) took the message to the pagan Scandinavian vikings, and was followed by the Englishman Haakon and the famous Olaf Tryggvason through whom the people of Iceland, Greenland and the Orkney and Shetland Islands were evangelized.

Missions from Constantinople as Centre.—While Rome was attending to the missionary task in northern, central and western Europe, the Eastern church did not forget the Slavonic world at its gates. South Russia and the Balkans were evangelized from Constantinople; in 863 Cyril and Methodius produced a Slavonic Bible and a Slavonic liturgy. The work spread from Bulgaria through Moravia to Bohemia and Poland and finally to Russia, where at the end of the tenth century with the baptism of Vladimir there was symbolized the conversion of Russia, the greatest of all the children of the Eastern Church.

As there was a pause between the end of the great expanding movement of the primitive Church in the Roman Empire and the beginning of mediaeval missions, a pause during which the Church was consolidating its gains and establishing Christian civilization, so now there is a pause until the opening of the modern period. Of the world outside Europe, the world of the Moslem, or the still remoter world of the Hindu and the Buddhist, the mediaeval Church knew almost nothing; although the Nestorian Christians spread their influence throughout the whole East, in Arabia, Palestine, Persia, India and even China, and as many as twenty-five metropolitans are said to have owed allegiance to the Nestorian patriarch. With the terrible persecution of Jenghiz Khan and Tamerlane the Nestorian churches withered away, and are represented now only by tiny remnants of "Chaldeans." The Crusades, which were no true missionary movement, permanently embittered the relations between Christendom and Islam. There are a few great stories that flash out as precursors of the wider missionary movement to come—Ramon Lull's undying zeal for the conversion of Islam, crowned by martyrdom outside the gates of Bugiah in North Africa in 1315, the visit of St. Francis of Assisi to the Sultan, the embassies of Dominicans and Franciscans (to whom with the Benedictines had fallen most of the missionary labour of the Church) to Tartary, and the travels of Marco Polo accompanied by two Dominicans, to the court of Kublai Khan.

MODERN MISSIONS

Early Movements. (1) *Roman Catholic.*—Modern Missions begin with the new world-outlook to which the Renaissance, the Reformation, and the discovery both of the passage to India by the Cape of Good Hope and of the American continent all conduced. The outlook of Christendom was magically changed. No longer were Christian nations in central and western Europe pent up into a corner with the Moslem hosts barring the way to an East virtually unknown to Christendom. The Roman Church first embraced the missionary implications of this new world-outlook, beginning with proselytizing in the Portuguese and Span-

ish colonies, as at Goa, but stimulated later by the counter-Reformation to unprecedented missionary efforts as for example in Mexico and Peru. Loyola founded the Society of Jesus, and one of his chief associates, Francis Xavier, landed at Goa on May 6, 1542. Ten years later he died on the Isle of St. John (Hiang-Shang). In that short span he had roused the Christians at Goa to a new life, laboured with a success whose effects still endure among the fisher folk near Cape Comorin, gathered many converts in Malabar, visited Malacca and founded a mission in Japan.

The Jesuits produced other men of the first rank as missionaries. Matteo Ricci laboured in China for 27 years, and Robert de Nobili tried in India to be a Brahman to the Brahmans, an experiment which has probably been misunderstood by its critics. Other Jesuits evangelized Paraguay in 1582, and pioneers in Canada added some rare stories of martyr-courage to the annals of missions. By the close of the 16th century a committee of cardinals was appointed under the name of the *Congregatio de propaganda fide* to give unity and solidity to the missionary work of the Roman Church. The scheme originated with Gregory XIII., but was given plenary authority by a bull of Gregory XV.

(2) *Protestant.*—Contrasted with the great missionary activity on the part of the Church of Rome, the Protestant Churches were backward in realizing the missionary implications of the faith. The opportunity for imperial expansion came to Spain and Portugal earlier than to England or Holland, and the Protestant Churches had to take time to define and consolidate their position. We see this in the instructions given by Edward VI. to the navigators of Sir Hugh Willoughby's fleet, in the efforts of Sir Walter Raleigh in Virginia, and in the expressed recognition, in the charter given to "the Governor and Company of Merchants of London trading with the East Indies" by Queen Elizabeth in 1600, of higher duties than those of commerce. When James I. granted letters patent for the occupation of Virginia it was directed that the "word and service of God be preached, planted and used as well in the said colonies as also as much as might be among the savages bordering among them."

In 1618 was published *The True Honour of Navigation and Navigators,* by John Wood, D.D., dedicated to the Governor of the East India Company, and about the same time appeared the famous treatise of Grotius, *De veritate religionis Christianae,* written for the use of settlers in distant lands. Dutch evangelists worked in Java, the Moluccas, Formosa and Ceylon.

The North American colonies received some attention, first from Archbishop Laud who designed a scheme for the establishment of a local episcopate, then during the Protectorate when a corporation for the propagation of the Gospel in New England was planned and renewed later in the Restoration period. Cromwell himself characteristically planned a council for the Protestant religion, to rival the Roman *Propaganda,* and to consist of seven councillors and four secretaries for different provinces. Among the most eminent of the missionaries of the New England corporation was the famous John Eliot who produced the Bible in the Indian language in 1661–64. Eliot received much assistance from the Hon. Robert Boyle, who gave other proof of his zeal for missionary work by contributing to the expense of publishing the four Gospels and the Acts of the Apostles in Malay. George Fox, the Quaker, wrote to "All Friends everywhere that have Indians or blacks, to preach the Gospel to them and their servants." Efforts were made by several bishops to develop the colonial church, supplemented by the work of Dr. Thomas Bray, who with a number of laymen founded the Society for the Promotion of Christian Knowledge and was later selected on the request of Maryland as commissary of the Bishop of London. His efforts were crowned in 1701 by the grant of letters patent under the great seal of England for the creation of a corporation under the name of the "Society for the Propagation of the Gospel in Foreign Parts."

On the Continent the first Protestant missionary enterprise was initiated by King Frederick IV. of Denmark who in 1705 founded a mission on the Coromandel coast of India, begun by those remarkable men Ziegenbalg, Plütschau and Christian Friedrich Schwartz, with whom the S.P.C.K. co-operated. The Moravians began in 1731 that astounding missionary career which has made them one of the great missionary churches of the world. Driven from Moravia by persecution, they had scarcely secured a place for themselves in Saxony before they formed the design of carrying the Gospel to the heathen of Greenland and of the West Indies. Within ten years they had established missions in the West Indies, South America, Surinam, Greenland, among the North American tribes, in Lapland, Tartary, Algiers, Guinea, the Cape of Good Hope and Ceylon.

The closing years of the 18th century and the early years of the 19th were marked by the foundation of several of the leading missionary societies of modern Protestant Christianity. The establishment of private societies not officially sponsored by the State and in most cases not officially supported by the Churches, is characteristic of this modern effort. William Carey, a Baptist cobbler in Northampton, and also a great linguist as well as a botanist and zoologist, published in 1792 his *Enquiry into the Obligations of Christians to use Means for the Conversion of the Heathens,* and the book marks a distinct point of departure in the history of Christianity. Under its influence twelve ministers at Kettering in October 1792 subscribed £13:2s:6d to begin the Baptist Society for Propagating the Gospel among the Heathen, and Carey left in 1793 for India. In 1795 the London Missionary Society was formed by a group of evangelical ministers of all denominations, particularly for work in the South Sea Islands.

The evangelical movement in the Church of England took missionary form in the Church Missionary Society, established in 1799 under the guidance of John Venn and Thomas Scott as "The Society for Missions to Africa and the East." This great society from its inception maintained cordial relations with the missionary societies of the Nonconformist Churches. In 1814 the Wesleyan Methodist Missionary Society was founded. In Scotland private missionary organizations in Edinburgh and Glasgow gave place to the organized work of the Church of Scotland, whose first missionary, sent out in 1829, was the famous Alexander Duff, the pioneer of the educational method in missions.

On the Continent of Europe there was a similar movement. The Basel Mission, which came to have large work on the Gold Coast of Africa and in India, was founded in 1815, drawing support from both southern Germany and Switzerland. Other German societies arose, such as the Leipzig, the Berlin and the Rhenish. The Netherlands Missionary Society (1797) in Holland began the evangelization of the Dutch Colonial possessions. The French a little later began their famous mission in South Africa.

In North America at the very end of the 18th century small societies were founded with a view to the evangelization of the Indians. The action of three students at Williams College in Massachusetts, who in 1806 formed themselves into a mission band, led to the formation of the American Board of Commissioners for Foreign Missions, an interdenominational society which like the London Missionary Society is now virtually, though not formally, a Congregationalist organization. The first offshoot from it was the American Baptist Missionary Union in 1814. The Methodist Episcopal Church founded its mission board, now the largest Protestant Missionary organization in the world, in 1819, and in 1837 the Presbyterians began a similar work.

No account of the stages by which the modern missionary movement developed would be complete without reference to two important features, which are to be taken into view along with the official work of the different denominational societies. First, there are the important bodies such as the Society for Promoting Christian Knowledge (1698), the Religious Tract Society of Scotland (1793), of London (1799), and America (1823), and most important of all, the great Bible Societies (*q.v.*)—the British and Foreign Bible Society (1804) and the American Bible Society (1816).

Secondly, there is the individual type of mission such as the China Inland Mission, founded by J. Hudson Taylor who went out to China in 1853; it has now over 1,000 missionaries there.

Recent Developments: Protestant. (1) *Great Britain.*—The eighties of last century marked a period of increased interest in missionary work throughout Great Britain. One of the

principal causes of this increased interest was the world-wide attention given to the life and work of David Livingstone and particularly to his death in 1873. In 1874 Bishop Hannington went to Africa and his murder in 1885 deeply touched the Christian conscience. In 1884-85 came the famous offer of service by the "Cambridge Seven," led by Stanley Smith and C. T. Studd. The offer for service in China on the part of these seven men gave an impetus to missionary interest in the Universities, not only in Great Britain but also in America, on the Continent and in the Dominions.

The principal instrument in the development of missionary interest among students has undoubtedly been the Student Volunteer Movement for Foreign Missions organized in 1886 in America and the Student Volunteer Missionary Union organized in 1892 in Great Britain.

Medical Missions have greatly developed and in certain countries, notably in Mohammedan lands and in such tracts as the North-West Frontier of India, are of singular value. In China the development of missionary medical training has been very noticeable and medical missions occupy an unusual place in relation to the medical profession.

Perhaps the most remarkable development of the missionary enterprise has been the great extension of women's work. It has only been in the last quarter of the nineteenth century that the missionary societies have engaged unmarried women to go out in any appreciable numbers. The larger denominations have developed their own Women's Auxiliaries (sometimes absorbing small voluntary societies). The Zenana Bible and Medical Mission was founded in 1861, and the Church of England Zenana Missionary Society in 1880.

(2) *Dominions.*—In Canada, Australia and New Zealand, the Protestant denominations all have regular organizations for foreign missions. The Anglicans of Canada have missionary work in India and in Japan, the Baptists in India, and the United Church of Canada (a union of Presbyterians, Methodists and Congregationalists) in India, China, Japan and Korea. The Presbyterians of Australia have missionary work in India, Korea and the South Seas, the Baptists in India, the Methodists in the South Seas. The Baptists and Presbyterians of New Zealand both have work in India. The Melanesian Mission associated with the names of Selwyn and Patteson is supported by the Anglican Churches in New Zealand and Australia. The London Missionary Society and the Church Missionary Society both have important auxiliaries in Australasia.

South Africa has a different problem. The Anglicans have in all their dioceses work among the African population. The Dutch Reformed Church is now one of the leading missionary churches.

(3) *Continental.*—The German Missions increased steadily until the World War. Of the Moravian Church we have already spoken. It has some two hundred and fifty missionaries working in Greenland, Labrador, Alaska, Central America, Tibet and among the Hottentots. The Basel Mission had extensive work on the Gold Coast of Africa, in the south-west of India, and in South China. The Berlin Missionary Society and the Rhenish Mission developed work in South Africa and China; the Hermannsburg Mission (Hanover) in South Africa and India; the Gossner Mission of Berlin among the aborigines of Chota Nagpur, India; and the Lutheran Leipzig Mission in South India. Other missions work in the South Seas. Two Missionary Societies work in the Dutch Colonies, an important Danish mission works in South India. The Swedes and Norwegians have increased their missionary activities in South Africa, Madagascar and India; the China Inland Mission has enlisted a number of Scandinavians.

(4) *America.*—One of the features of missionary work in the present century has been the growth of American missionary activity. At the present time American missions represent probably seventy per cent of the Protestant missionary work in the world. The large denominations have all vastly increased their work especially as the result of large appeals made immediately after the war. The Young Men's Christian Association, founded in England and now extending throughout the world, has reached its maximum influence in the United States and the Young Men's Christian Associations of India, China, Japan, South-eastern Asia and the Near East have all been greatly indebted to the foreign department of the American Y.M.C.A.

(5) *Christian Missions to the Jews.*—Missions to the Jews have been conducted by a few Societies. In 1926 two important conferences were held in Budapest and Warsaw attended by representatives of all the Protestant organizations in the world engaged in missionary work among the Jews. These conferences revealed the immensely wide dispersion of Jewry, and the small number of missionaries of any kind ministering to the Jews. Plans were made for the increase of efficiency.

(6) *General.*—One of the most notable developments of Protestant missionary work since 1910, the date of the World Missionary Conference held at Edinburgh, is the development of co-operation among Missionary Societies in Great Britain, America and on the Continent of Europe and on the part of the churches in the mission field. The Edinburgh Conference created widespread attention. It resulted in the establishment of the International Missionary Council, consisting of representatives of all the national missionary organizations.

The enlarged meeting of the International Missionary Council, held at Easter 1928 at Jerusalem, typified in its discussions many of the leading tendencies in modern missionary work. Attention was given both to such fundamental matters as the Christian Message, Christian Education, the growth of the Church and its relation to the missionary societies from the West, and also to such "secular" problems as race, industrialism, and rural development. Between a third and a half of the members were natives of the Oriental and African countries, and the reports of this gathering are an indispensable source of information regarding modern missionary movements.

Recent Developments: Roman Catholic.—The Roman Catholic Church at the beginning of the nineteenth century seems to have been not less stagnant in regard to foreign missions than were the Protestant churches. The nineteenth century however witnessed a great change. The revival was due in no small degree to the foundation in 1822 by a few earnest Catholics at Lyons of a Society called the Institute for the Propagation of the Faith. The income of this society in 1925 had risen to approximately £325,000. This Institute does not send out missionaries but makes grants to the various missionary groups. Roman missionary work is carried on by religious orders and missionary societies under the supreme direction of the Pope and the supervision of the *Congregatio de Propaganda Fide.* The Congregation holds supreme control over all foreign missions in non-Christian countries and over some parts of the Church in Christian countries whose governments are not Catholic, *e.g.*, the British Empire, America, Holland, Scandinavia, Greece and some parts of Germany and Switzerland. The non-Christian world is carefully mapped out among the different orders. The government of the various mission fields is principally carried on by Vicars Apostolic (*i.e.*, titular bishops acting as vicars or delegates of the Apostolic See) or Prefects Apostolic (*i.e.*, priests with similar powers, but without episcopal rank).

Two important encyclicals have been issued dealing with missionary work. Pope Benedict XV. in 1919 issued the encyclical *Maximum Illud* in which extensive directions were given for the conduct of missionary work, exaggerated expressions of nationalism were severely condemned and great emphasis was laid on the importance of developing a native clergy. Following upon this in 1926 six Chinese priests were consecrated bishops and in 1927 one Japanese priest. In 1926 Pope Pius XI. issued the encyclical *Rerum Ecclesiae* in which he developed the subject matter of *Maximum Illud,* pointing out the paucity of missionaries, the lack of native ministers and the urgent need for training colleges being established with a view to the equipment of native clergy including bishops. The Pope further urged all Catholics to support the Society of the Propagation of the Faith, the Society of Holy Childhood (for the supporting of orphans, etc.) and the Society of S. Peter (for training native priests), and all priests to join the *Unio cleri pro missionibus* (Missionary Clergy Union). He emphasized also the annual day of prayer appointed for the

penultimate Sunday in October. A great missionary exhibition was held at the Vatican during the Holy Year of 1925, and at the close of the Exhibition a museum of missions was established.

Orthodox Eastern Church.—When Ivan the Terrible (1533–84) began the great advance from Russia to Northern Asia, large numbers of missionaries accompanied the troops, and during the seventeenth century many thousands of Tartars were baptised, though most lapsed again to heathenism. Little was done until 1824 when John Veniaminov, later Archbishop Innocent, began a remarkable career of evangelistic activity. He founded missions in Alaska, the Aleutian Islands, Kamchatka and Eastern Siberia, and established the Orthodox Missionary Society at Moscow. In addition to nine separate missions in Siberia and six in European Russia, the Orthodox Church of Russia has had three foreign missions: in China, founded at Peking in 1714 in the face of Jesuit opposition; in Alaska and the Aleutian Islands; and in Japan. The last of these, established in 1863 by Bishop Nicolai, had very remarkable success, and a large Japanese Church was gathered, larger probably in proportion to the number of foreign workers than any other communion in Japan. The work of the Russian Orthodox Church has, however, suffered grievously since the War and the establishment of the Soviet Government, and the Orthodox Church in Japan has become considerably weakened.

HISTORY OF MISSION FIELDS

The South Seas.—Missionary work in the Pacific began with Magellan's visit to the *Philippines* in 1521. Roman Catholic missionary work was carried on from an early date in the *Caroline Islands* and others adjacent. Modern Protestant effort began with the sending of the London Missionary Society ship "Duff" in 1797 to *Tahiti*, the *Tonga* or *Friendly Islands* and the *Marquesas*. By 1815 idolatry was abolished in the larger islands of the Tahiti group. In the work of building up a Christian community the great leaders were William Ellis and John Williams; the latter established at Rarotonga a training school from which workers went as far as *Samoa* and *Fiji*, and was murdered at Erromanga in 1839. The London Missionary Society's work was notable for the evangelistic activity of its converts. The Wesleyans had great success in *Fiji* to which they came in 1834. The bulk of the natives of the Fiji group are now Christians.

The *Sandwich* or *Hawaiian Islands* were discovered by Captain Cook and work began in them in 1819 when the American Board of Commissioners for Foreign Missions sent missionaries. Great success was achieved and the work of the mission was handed over to the Hawaiian Evangelistic Association. Hawaiian missionaries went to the Marquesas and other islands in the Pacific.

Australasia.—Little success has been gained among the aborigines of Australia. In New Zealand much greater success was attained among the Maoris, among whom the Church Missionary Society began work in 1814. In 1833 Wesleyan missionaries reached the Islands; Bishop Selwyn was consecrated in 1841 and established in 1843 at Auckland a training institution not only for Maoris but for workers from other islands. More than half the Maori population is now Christian; the first Maori Bishop was consecrated in 1928.

John Patteson became the first Bishop of Melanesia in 1861. He transferred the training institute from Auckland, New Zealand, to the Norfolk Islands. It is part of the tragedy of his martyrdom that he was killed by natives who mistook him for one of the kidnapping traders to whose operations the islands owed so much of the decay of their life. The Church of England Melanesian Mission operates in the North New Hebrides, Banks Torres, Santa Cruz and the Solomon Islands.

In New Guinea the Gossner missionaries were the pioneers, followed by the Dutch who work in the Dutch part of the islands. Several German societies work in what was German New Guinea (now mandated territory), and in British New Guinea the London Missionary Society, the Australian Wesleyans and the Anglicans.

Work was established later in the islands of Micronesia, the Carolines, the Gilberts and Marshalls. The Philippine Islands are fields of Roman Catholic and American Protestant work.

Africa.—This continent is in every sense a modern mission field. Apart from North Africa, it is only within modern times that mission work has been carried on in the African continent.

North Africa.—The lands in which Augustine, Cyprian and Tertullian lived have long been occupied by Islam, and even now missionary work whether Protestant or Roman Catholic is weak. The North Africa Mission works mainly on medical lines. The Methodist Episcopal Church has work in Morocco. In the Sudan and right across to Northern Nigeria, missionary work is carried on by agencies such as the Sudan United Mission and the Sudan Interior Mission.

West Africa.—Mission work was begun in West Africa by the Society for the Propagation of the Gospel in 1752, and work has been carried on longer and has achieved greater results in West Africa than in any other part of the continent. The Church Missionary Society, the Wesleyans and the United Free Church of Scotland work on the Gold Coast, in Sierra Leone, Calabar and Nigeria. The Basel Mission had very extensive work on the Gold Coast up to the outbreak of the War, and have now returned to their field. The American Baptists and the Episcopalians work in Liberia, the American Presbyterians in the Cameroons, and the Congregationalists of America and Canada in Angola.

The Roman Catholic missions in West Africa are chiefly French organized by the Congregation of the Holy Ghost and the Lyons African Mission.

Central Africa.—In the interior of the continent the French and Belgium Protestant Churches have done some excellent work in the Congo, and the American Baptists, the Southern Presbyterians, the Methodists and the Disciples and a number of "faith" missions have developed the region. The English Baptist Mission on the Congo is the chief British mission there.

East Africa.—In Kenya the leading Protestant missions are those of the Church Missionary Society and the Church of Scotland Mission. The United Methodists also work in Kenya, while the Church Missionary Society has a large mission in Uganda. The Universities' Mission to Central Africa works in Zanzibar, Tanganyika (formerly German East Africa), and other parts of East Africa. Several German societies have done important work in Tanganyika.

South Africa.—The Moravians (1737) were the first to undertake missionary work in South Africa, but their work was soon stopped by the Dutch. The London Mission came in 1798 and in 1818 Robert Moffat, Livingstone's father-in-law, went to Bechuanaland. David Livingstone, one of the very small band of world-famous men, came to South Africa under the London Missionary Society, and dedicated a great life to the evangelization of Africa and the abolition of the slave trade.

Madagascar.—Work was begun in this island by the London Missionary Society in 1819, and it has since been developed by the Friends, the Society for the Propagation of the Gospel and the Norwegian Missionary Society. Since the French took control of the island, the Paris Evangelical Society has worked there.

The work of Protestant missions throughout Africa was comprehensively surveyed in a gathering held at Le Zoute in Belgium in September 1926.

India.—India remains the greatest mission field both in the extent of Christian work and in respect of the variety and difficulty of Christian work and in respect of the variety and difficulty of the issues which are presented there. The earliest missionaries to India, with the possible exception of Pantaenus of Alexandria (*c.* A.D. 180), were the founders of the Syrian Churches of Malabar. The traditional belief is that these Christians owe their origin to St. Thomas the Apostle, and although a Nestorian origin has been preferred by most historians, the Thomas legend has its defenders. The Jesuits came in the 16th century, the Dutch, the Danes, the Germans and the British as we have told above. William Carey, so far as Protestant missions are concerned, began a new era with his emphasis upon literary work, the translation of the Scriptures and the training of native workers. Carey and his two colleagues, Marshman and Ward, by 1834 when Carey died, had translated the Bible into 7 languages, and the New Testament into 23 more.

The methods of mission work in India most used are: (1) The

regular method of vernacular preaching carried on both by Indian preachers and by missionaries; (2) Education in all its grades from the village school through the middle school to the high school and the college. Christian education has reached women and girls in India in a way unequalled by any other agency; (3) Medical work: while medical work as an auxiliary of the Church has had triumphs everywhere, it is notable in India for its value among the *purdah* women, and on the North-west frontier where almost no other kind of work is possible; (4) The mass movement may almost be called a separate method. These movements of the outcasts have been especially large in the Punjab, the United Provinces, parts of western India, the Telegu country and Travancore. There have also been great ingatherings of the aborigines in Chota Nagpur and among the Khasis and Lushais in the Assam hills; (5) Christian Literature: more has been done in creating Protestant Christian literature in India than in most countries, but the supply is not adequate to the demand; (6) Special mention should be made of the special work conducted by the women's societies among *purdah* women in their homes, and in visiting schools and hospitals.

The great task presented by Indian Islam tends to be overshadowed by the needs of Hinduism. Converts from Islam in India have not been numerous, yet some leading Christians of northern India are converts or children of converts from Islam. Much more attention is now given to the study of Indian Islam.

It is well-known that in India, more perhaps than in any other country, the effects of Christian work are only partly seen in the numbers of the Christian communities. The Brahmo-Samaj, chiefly in Bengal, is a type of reformed Hinduism which owes much of its impetus to contact with Christianity. The Arya Samaj, mainly in North India, is an example of the opposite kind of reaction to contact with Christianity, *i.e.*, a return to an earlier Hinduism as the true Indian heritage. Nationalism has rehabilitated Hinduism in many minds, and nationalism together with the almost ineradicable pantheism of the Indian mind present a strong defence against the Christian evangelistic message. On the other hand there is widespread testimony to the admiration felt by educated Indians everywhere for the person of Jesus Christ.

The Christian community of India is estimated to number 5,939,212, of whom 2,242,798 are Protestant; 791,556 belong to the ancient Syrian churches, and 2,906,858 to the Roman Catholic Church. There are 48,787 Protestant Indian workers and 17,164 Catholic (1928).

China.—We have already mentioned the great missionary activity of the Nestorians. It was they who were the first missionaries to China, but their work and that of the Roman Church, begun as the result of Marco Polo's travels about 1290 faded away under the persecution of the Ming dynasty, which came into power about 1350. The next attempt was that of the French Jesuits following on the visit and death of Xavier. They advanced rapidly, especially after the accession in 1644 of the Manchu dynasty. The Orthodox Eastern Church came to Peking about the same time.

Modern missionary activity begins with Robert Morrison of the London Missionary Society, who reached Canton in 1807, and not being allowed to reside in China entered into the service of the East India Company. In 1829 the American Board sent their first representatives, and in 1836 Peter Parker began his famous medical mission. After the war of 1856 a measure of official toleration was obtained and the task of evangelizing the country was fairly begun. In 1877 the number of Protestant converts in the whole of China was reckoned at no more than 13,000, though Protestant missionaries had been seventy years in the country. Public feeling against foreigners was accentuated by the territorial aggression of the French, German, British and Japanese. There were anti-foreign outbreaks at different times but the great upheaval came in 1899–1900 when in what was known as the Boxer uprising 135 missionaries, 52 children and probably 16,000 Chinese Christians perished, often after torture and showing constancy and heroism never to be forgotten.

The Boxer rising was put down, and out of the agony of these years was born the new China, of which the history remains still to be written. The reforms of 1901–04, especially the decrees regarding education, contained within themselves a complete reversal of the traditional policy of China. A system of public instruction of the most extensive sort was drafted. Universities, technical schools and lower schools were designed, and young Chinese began to turn their faces towards the West.

Meanwhile the missionary societies had never slackened their efforts. Whereas in 1876 there were 289 mission schools with 4,909 pupils, in 1910 the numbers had risen to 3,129 schools with 79,823 scholars. American influence became particularly powerful, not least because the American government used part of the indemnity paid after the Boxer rising to provide scholarships to enable Chinese students to pursue their studies in America.

The recent developments in China have had a profound effect on missionary work. The Manchu dynasty was overthrown in 1911 by a revolution led by Sun Yat-sen. In 1925 he died and his book "The Three Principles" became the gospel of Chinese nationalism; the nationalist party dedicated itself to carrying out the purposes of the dead hero. The nationalist government of the South has made itself the *de facto* government of China and the whole future relationship of China to the western powers is the subject of international debate.

This entire series of political events has been reflected in the Chinese Church and every mission board in the world conducting work in China has been forced to review drastically its whole policy, particularly in regard to the relations between the missionaries and the Chinese Church. Already Chinese Christians have shown themselves able to take up work which missionaries were compelled to leave during the fighting, and especially in the work of the colleges and schools have shown both initiative and responsibility.

The growth of Christianity in China may be shown by the fact that in 1925 the total number of the Protestant Christian community in China was 795,095, and there were 27,133 Chinese evangelists, pastors, teachers and other workers. The Roman Catholic returns give 27,640 Chinese priests and lay helpers, 556,201 catechumens, the total community being much larger.

Japan and Korea.—Portuguese traders first brought the Christian faith to Japan in 1542, followed by Xavier in 1549. By 1581 there were 200 churches and 150,000 Christians. In 1594 there were one and a half million Christians. There followed a time of great persecution under Iyeyasu who in his second edict in 1614 forbade the entry of foreigners and extinguished Christianity by fire and sword.

The reopening of the country came in 1859, largely through American pressure, and in that year the Protestant Episcopal Church began work in Nagasaki. In 1868 the seclusion of Japan ended; financiers and engineers poured in from western Europe, and teachers, mainly missionaries, from America. In 1872 the first Japanese church was formed. In 1875 Joseph Neesima, converted by a Russian missionary and educated in America, founded the Christian Japanese College, the Doshisha, in Kyoto.

The war with China in 1894 initiated a time of intense national activity. Education and work for women made rapid advance and the work of missionaries, and especially that of Japanese ministers, prospered greatly. Christians more and more became prominent in public life.

In 1912 was held a conference of religions, when the government invited representatives of Shintoism, Buddhism and Christianity to meet and discuss the moral education of Japan. This recognition of Christianity as a religion tolerable in Japan marked in a way the beginning of a new epoch.

The Protestant community of Japan is about 165,000 (the Roman Catholics 80,000 and Orthodox 30,000) with 3,500 Japanese workers. It would be fair to say that Christians exercise an influence far greater than their numbers.

In Korea, early Roman Catholic Christianity introduced at the end of the 18th century was exterminated in 1864, but missionaries entered again in the 'eighties and the Methodist Episcopal Church, the Presbyterians of America, of Canada, and of Australia, and the Society for the Propagation of the Gospel have all developed work in the country. A Korean National Christian

Council has been formed, and the Korean Christian leaders are pressing for some attention to be given to the bearing of Christianity on economic and social issues.

South-east Asia.—Burma, although a part of the Indian Empire and ecclesiastically related with India and Ceylon, has many of the characteristics of South-east Asia. The largest mission in Burma is that of the American Baptists, founded by Adoniram Judson in 1813. The Society for the Propagation of the Gospel has a mission in Burma, and both societies have had much success with the Karens, a non-Burmese people of whom a considerable portion have now become Christian.

In Siam the American Presbyterians have had the field virtually to themselves.

In Tongking and Annam, French colonies, Roman Catholic missions are extensive and strong.

In the Malay States practically no work is done among the Moslems, but a good deal among the Indians and other immigrant people, largely by the Methodist Episcopal Church. In the Straits Settlements, the Society for the Propagation of the Gospel, the Methodist Episcopal Church, the English Presbyterians and the Church of England Zenana Missionary Society are all at work. In the Dutch Indies naturally the work has fallen to the Netherlands Missionary Society (1812) and other Dutch agencies, which have been highly successful. There is an important German Mission, the Rhenish, working among the Bataks of Sumatra. In Dutch Borneo, the Rhenish Society is making headway among the Dyaks, and in British Borneo and Sarawak the Society for the Propagation of the Gospel and the Methodist Episcopal Church. The total number of Christians in British Malaysia and the Dutch East Indies is about 857,800, including 60,000 Roman Catholics.

The Near East.—Few areas have undergone more startling changes than have taken place since the War in the Moslem lands of the Near East—Egypt, Turkey, Palestine, Syria, Arabia, Iraq and Persia.

The chief missions working in this area are the Church Missionary Society in Persia, Palestine and Egypt, the American Board in Turkey, the American Presbyterians in Persia and Syria and the American United Presbyterians in Egypt. There is also a mission of the American Reformed Church in Arabia in the Koweit region, and a mission of the United Free Church of Scotland near Aden. The establishment of well equipped colleges at Constantinople, Beirut, Smyrna, Cairo and other centres has been the distinguishing feature of the American mission policy in this area.

A Christian Council for Western Asia and Northern Africa was founded in 1926. The most effective co-operative work has been done in the production of Christian literature for Moslems.

Latin America.—The missionary societies of North America carry on much work in the southern continent, partly among the Indian population, partly among the nominally Catholic Spanish-speaking people. The intellectual life of the S. American universities is keen and deserves more attention than it receives at the hands of Europe. There are two British missions, the South American Missionary Society (Anglican) which works among the Indians and received the praise of Charles Darwin for its achievements among the Fuegians, and the Evangelical Union of South America.

SUMMARY

We may end this survey of missionary history by suggesting four reflections to which it leads. First, it is impossible to resist the impression that there is in the Christian faith, whether in its Protestant or its Catholic profession, an ineradicable conviction of universality. There is in spite of its unevenness a singular continuity in this Christian missionary effort. After every falling away there is a renaissance, as Christians recover fidelity to the mind of their Master. Second, the beneficence of the labours of missionaries can never be forgotten. In rescuing the oppressed, abolishing tyranny and superstition, spreading education, introducing medicine, raising the status of woman, protecting children, stimulating social reform, the world has never seen any service to compare with that of the Christian missionaries. Third, it is perhaps the greatest international enterprise in the world. The Churches of practically all the Western peoples have engaged in it, and now that the younger Churches in the mission-field are growing up, there is coming into being a literally world-wide Christian fellowship. Fourth, missionary work has added to the tale of human history some of the greatest of personalities. The names of a few have been given above.

The ultimate argument for Christian missions lies now, as it has always lain, in the conviction laid upon Christians that they owe to their Saviour a gift so precious that they cannot keep it to themselves. The modern world may find a secondary motive in the fact that there is arising in all countries the outline of a common (and largely secular) civilization, and that it is abundantly clear that the ancient religions are largely irrelevant to it. At the same time all history goes to show that no society can survive without a religious and moral basis, and it appears likely that mankind will more and more be driven to choose between secularism and the religion of Jesus.

Statistics.—Too much reliance should not be placed upon these, as the facilities for collecting figures vary enormously in the different countries, and different standards of valuation are used. In the World Missionary Atlas (1925) figures are given for Protestant missions which may be compared with those gathered in 1907.

Missionaries	1925	1907
Ordained men	7,625 3,644 North America 2,831 Britain and Dominions	5,735 1,980 British 1,911 U.S.A.
Unordained men	3,819 1,917 North America 1,146 Britain and Dominions	2,802 1,738 British 535 U.S.A.
Unmarried women	9,125 5,362 North America 3,018 Britain and Dominions	4,387 2,332 British 1,527 U.S.A.

Indigenous churches	1925	1907
Ordained workers	10,493	5,273
Communicants (full members)	3,614,154	1,817,450
Total Christian Community (Protestant)	8,342,378	4,361,138
Scholars (all types of schools)	2,440,148	1,302,905

Roman Catholic Missions.—The *Little Atlas of Catholic Missions* (1926) contains figures gathered for the Vatican Exhibition of 1925 and given in Arens' *Handbuch* (1925). They are compared here with figures for 1908:

	1925	1908
Foreign Priests	8,196	7,933
Native Priests	4,516	5,837
Foreign lay brothers	3,187	5,270 (total of foreign and native)
Native lay brothers	732	
Foreign Sisters	12,944	21,320 (total of foreign and native)
Native Sisters	11,158	
Native Catholics	11,956,160	7,441,215
Catechumens	1,534,446	1,517,909
Schools (upper and lower)	21,753	24,000

Bibliography.—The *Report of the World Missionary Conference* (1910) 9 vols. is still worth consulting. The *Complete Report of the Jerusalem Meeting of the International Missionary Council* (1928) is indispensable. Detailed facts and figures may be got from the *World Missionary Atlas* (2nd ed. 1925) for Protestant missions, and from the *Little Atlas of Catholic Missions* (Rome, 1925) for Roman Catholic missions. Other invaluable general works are Arens' *Handbuch der katholischen Missionen* (1925); Richter's *History of Protestant Missions in India* (2nd German ed., 1924); Richter's *Geschichte der evangelischen Mission in Afrika* (1922); Richter's *Das Werden der Christ-*

lichen Kirche in China (1925) Latourette's *History of Christianity in China* (1928); Moore's *The Spread of Christianity in the Modern World* (1919); *A History of Protestant Missions in the Near East* (1910). Of denominational histories may be mentioned Stock, *History of the Church Missionary Society* (1899); Myers, *Centenary Volume of the Baptist Missionary Society* (1892); Lovett's *History of the London Missionary Society* (1899); Findlay and Holdsworth's *History of the Wesleyan Methodist Missionary Society* (1924). Among older books are E. M. Bliss, *The Missionary Enterprise* (1908); E. Stock, *A Short Handbook of Missions* (1904); H. H. Montgomery, *Foreign Missions* (1904); T. Moscrop, *The Kingdom without Frontiers* (1910); S. L. Gulick, *The Growth of the Kingdom of God* (1897); G. Smith, *Short History of Christian Missions* (1897); G. Warneck, *Outline of a History of Protestant Missions* (1910). A complete bibliography appears in each number of the *International Review of Missions*, the organ of the International Missionary Council. (W. Pa.)

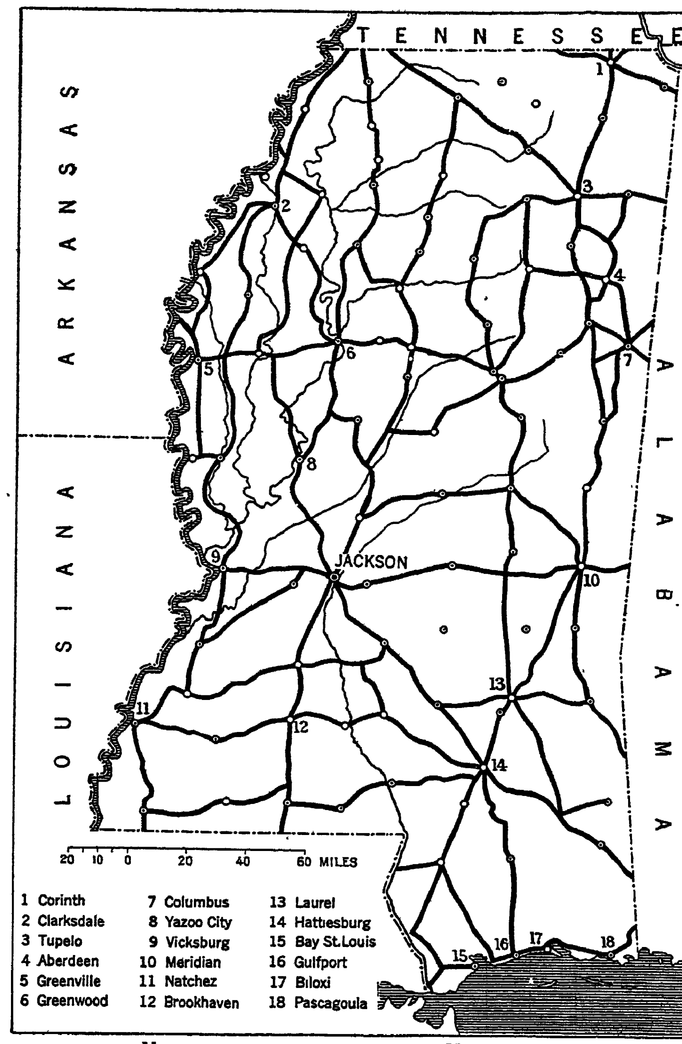
MISSISSIPPI (mĭs-ĭ-sĭp'ĭ), the "Magnolia State," a South Central State of the U.S.A., situated between 30° 13′ and 35° N. lat. and 88° 7′ and 91° 41′ longitude W. of Greenwich. The State is bounded N. by Tennessee, E. by Alabama, S. by the Gulf of Mexico and Louisiana, and W. by Louisiana, from which it is separated by the Pearl river and the Mississippi, and by Arkansas, from which it is separated by the Mississippi. The total area is 46,865 sq.m., of which 503 sq.m. are water surface.

Physical Features.—The greater part of the State lies in the Mississippi embayment of the Gulf coastal plain, the surface rising almost imperceptibly from the coast to the north-east. The highest elevations, about 800 ft. above the sea, are on the Pontotoc ridge in Tippah and Union counties in the north. The uplift of the State is enough to expose the formations of four distinct geological periods. In the extreme N.E. are found the oldest rocks in the State—lower Devonian and, not so old, an extension of the lower Carboniferous which underlies the Warrior coal-fields of Alabama. The Cretaceous region includes, with the exception of the lower Carboniferous, all that part of the State eastward of a line cutting the Tennessee boundary about 25 m. W., and drawn southward and eastward about 75 m., to the Alabama line. Deposits of the Tertiary period cover more than half the State, extending from the border of the Cretaceous westward nearly to the Yazoo delta and the Mississippi bottom, and southward to within a few miles of the Gulf coast. Seven formations, or groups, of the Tertiary strata have been distinguished in Mississippi. The older formation of the Quaternary period is the Lafayette, which immediately overlies all the Cretaceous groups except the prairies of the Selma chalk and all the Tertiary except the Porters Creek and Vicksburg formations and part of the Jackson. The second Quaternary formation is the Port Hudson, occurring within 20 m. of the Gulf coast, and, with alluvium, in the Yazoo delta. The Yazoo delta is a strip of bottom land between the Mississippi and Yazoo rivers, extending from N. to S. about 175 m., with an average width of more than 60 m. and covering an area of about 7,000 sq. m. With the exception of a few flat ridges running from N. to S., it is so low that, to protect it from overflows, it requires an unbroken line of levees averaging 15 ft. in height. Along the eastern border of this delta, and along the Mississippi itself, extends a belt of hills or bluffs cut by deep ravines. East of the belt are level or gently rolling prairies, and along the Gulf coast is a low, marshy tract.

The coast-line, about 85 m. long, is bordered by a beach of white sand, and broken by several small and shallow indentations, among which are St. Louis, Biloxi, Pascagoula and Point aux Chênes bays. Separated from it by the shallow and practically unnavigable Mississippi sound is a chain of low, long and narrow sand islands, the largest of which are Petit Bois, Horn, Ship and Cat.

The principal rivers are: the Mississippi on the western border, and its tributaries, the Yazoo and the Big Black; the Pearl and Pascagoula, which drain much of the southern portion of the State and flow into the Gulf; and the Tombigbee, which drains most of the north-eastern portion. The Pontotoc ridge separates the drainage system of the Mississippi from that of the Tombigbee. Extending from the north-eastern part of the State southward, this ridge divides in Choctaw county, the eastern branch separating the drainage basin of the Pascagoula from that of the Pearl, and the western branch separating the drainage basin of the Pearl from that of the Big Black and the Mississippi. The delta is drained chiefly by the Yazoo. A small area in the north-eastern corner is drained northward by the Tennessee and the Hatchie. Most of the rivers flowing into the Gulf are obstructed by sand-bars and navigable only during high water from January to April. Oxbow lakes and bayous are common only in the Delta.

Climate.—The southern latitude, the low elevation and the proximity to the Gulf of Mexico produce in southern Mississippi a



MAP SHOWING MAIN ROADS OF MISSISSIPPI

rather mild and equable climate, but to the northward the extremes increase. The normal mean annual temperature for the State is 64°, on the coast it is 67°, and on the northern border 61°. Annual precipitation for the State is about 51 in. (southern half, 54 in.; northern half, 49 in.). Nearly one-third of the rain falls in Jan., Feb. and March; July, also, is one of the wet months. The driest season is in Sept. and October. The prevailing winds are from the S.E.; but the rain-bearing winds chiefly from the S.W., and the high winds from the west and north-west.

The most fertile soil is the alluvium of the delta, deposited during the overflows of the Mississippi. Others that are exceedingly productive are the black calcareous loam of the prairies, the calcareous silt of the bluff belt along the eastern border of the delta, and the brown loam of the table-land in the central part of the State.

Government.—The chief special object of the present Constitution, adopted Nov. 1, 1890, was to preserve in a legal manner the supremacy of the whites over the ignorant negro majority. In addition to the ordinary suffrage qualifications of age and residence, the voter must have paid all taxes due from him for the two years preceding the election, and he must be able to read any section of the Constitution or "be able to understand the same when read to him, or give a reasonable interpretation thereof."

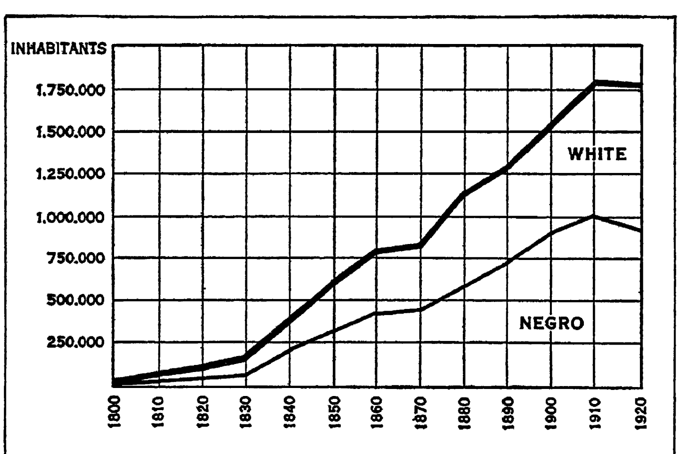
In 1916 the initiative and referendum were adopted by an amendment to the Constitution, thereby placing the Government more within the direct control of the people. Under its provisions, an initiative petition must be supported by 7,500 qualified electors, and a referendum petition by 6,000.

The chief executive constitutional officials are the governor, lieutenant governor, secretary of State, treasurer, auditor, attorney general and superintendent of education. All are chosen for terms of four years, and the governor, treasurer and auditor are ineligible for immediate re-election. The method of election is based in part upon the national presidential model. The governor is empowered to call extraordinary sessions of the legislature, to grant pardons and reprieves, and to exercise a power of veto which extends to items in appropriation bills. A two-thirds majority of the legislature is necessary to pass a bill over his veto.

The legislature consists of a senate and a house of representatives, chosen every four years. Since 1912, it has met in regular session biennially, and in extraordinary session whenever the governor has seen fit to call it. Revenue measures may originate in either house, but a three-fifths vote in each is necessary to their enactment.

The judiciary consists of a supreme court of six judges, 17 circuit courts, ten chancery courts, county courts and magistrate courts. The supreme court judges are elected for a term of eight years, and the circuit and chancery judges for four years. A majority of nine jurors may return a verdict in all civil cases in the circuit and chancery courts.

Population.—The population at selected census periods was: 8,850 in 1800; 40,352 in 1810; 606,526 in 1850; 1,131,597 in 1880; 1,551,270 in 1900; 1,797,114 in 1910; 1,790,618 in 1920; 2,009,821 in 1930. The census of 1920 showed a decrease of 6,496, or nearly ·4% from the figures for 1910. The negro population was 935,184, or 52·2% of the total, compared with 1,009,487, or 56·2% of the total in 1910. The foreign-born whites in 1920 numbered 8,019. The density was 38·6 per sq. mile. The seven cities having a population of more than 14,000 in 1930 were Jackson (48,282), Meridian (31,954), Vicksburg (22,943), Hattiesburg (18,601), Laurel (18,017), Biloxi (14,850) and Greenville (14,807).



GRAPH OF THE GROWTH OF POPULATION IN MISSISSIPPI, 1800–1920, SHOWING RELATIVE PROPORTIONS OF NEGRO AND WHITE AT EACH CENSUS

Finance.—The total receipts and disbursements for the fiscal year ended Sept. 30, 1925 were $17,731,150.70 and $17,756,116.18 respectively. The State indebtedness Oct. 1, 1925, consisted of $14,543,250 in outstanding State bonds.

Deposits in State banks are protected by a State guaranty fund. On June 30, 1925, there were 36 national banks and 323 State banks, with total resources and liabilities of $248,538,000. Deposits were $159,156,000.

Education.—Educational interests were almost entirely neglected during the colonial and Territorial periods. The first school established in the State was Jefferson college, now Jefferson Military college, near Natchez, Adams county, incorporated in 1802. Charters were granted to schools in Claiborne, Wilkinson and Amite counties in 1809–15, and to Port Gibson academy and Mississippi college, at Clinton, in 1826. The State established in 1819 the first educational institution which granted diplomas to women. The public school system was established in 1846.

Mississippi was the first State in the Union to establish, in 1884, a State-supported college for women. The lack of normal training for white teachers (from 1870 to 1904 there was a normal school for negroes at Holly Springs) continued until 1890, when a teachers' training course was introduced into the curriculum of the State University. There are separate schools for whites and blacks, with equipment and service approximately equal, although the whites pay about nine-tenths of the school taxes. The schools are subject to the supervision of a State superintendent of public education and of a board of education, composed of the superintendent, the secretary of State and the attorney general; and within each county, to a county superintendent and a county board of education. The schools are supported by a poll-tax, a dog-tax, by general appropriations, by local levies and by the Chickasaw school fund. An act of Congress of March 3, 1803, reserved from sale Section 16 of the public lands in each township for educational purposes.

A unique and distinctive educational and cultural State department was established in 1902 for the preservation and publication of the history of the State. The State department of archives and history is founded on the idea that the State owes a duty to its history. The department has issued a veritable library of Mississippi history, has created a beautiful State Hall of Fame, and has the best State Museum in the country.

An important development in education was the establishment in 1908 of county agricultural high schools. Every county may establish one for white children and one for negroes, or two counties may combine and create one set of schools for the two counties. These schools receive State aid based on the number of boarding pupils. The public school system was modernized and made uniform throughout the State by the school code of 1924.

The school population between five and 17 years of age, inclusive, in 1924, was 593,962. Of this number 560,971, or 94·4%, were in the public schools. High schools numbered 330 in 1925. The State institutions for higher education are: the University of Mississippi (chartered 1844; opened 1848), at University, near Oxford; the Agricultural and Mechanical college (opened 1880), at A. and M. College, near Starkville; the State College for Women (opened in 1885 as the Industrial Institute and College for Girls), at Columbus; the Alcorn Agricultural and Mechanical College for Negroes (1871; reorganized in 1878), at Alcorn; the State Teachers college, at Hattiesburg; the Delta State Teachers college at Cleveland; and many colleges not supported by the State. An agricultural experiment station, established in 1887 under the Hatch act, is at the Agricultural College near Starkville; and there are branch experiment stations at McNeill, Holly Springs and Stoneville.

Charities and Reformatories.—The charitable institutions of the State are supervised by separate boards of trustees appointed by the governor. Institutions maintained by the State are: the Mississippi Insane hospital, at Jackson; East Mississippi Insane hospital, at Meridian; the school and colony for feeble-minded, at Ellisville; Mississippi State Charity Hospital, at Jackson; South Mississippi Charity Hospital, at Laurel; Matty Hersee Hospital, at Meridian; the Tuberculosis Sanatorium, at Magee; the Jefferson Davis Beauvoir Memorial Home (for old soldiers), at Biloxi; and a school for the deaf and a school for the blind, at Jackson. State aid is given to the hospitals at Vicksburg and Natchez and also to 21 hospitals distributed over the State. The Mississippi Industrial and Training School for Delinquent and Abandoned Children was established at Columbia in 1916. The farm penitentiaries of the State are controlled by a board of three trustees elected by the people; they are managed by a superintendent appointed for a term of four years by the governor. The convict lease system was abolished by the Constitution of 1890, and State farms were purchased in Rankin, Hinds and Holmes counties, and later in Sunflower county.

Industry, Trade and Transport.—Agriculture is the leading

industry of the State, and cotton is the chief product. The total value for all farm crops produced in 1926 was estimated at $192,-758,000, and of this amount the cotton was valued at $112,000,000. Cotton is grown in every county of the State, but the large yields are in the delta (Bolivar, Coahoma, Washington, Yazoo and Leflore counties), and in Monroe, Lowndes and Noxubee counties on the Alabama border. The acreage of cotton in 1926 was 3,768,000; the yield was 1,930,000 bales, exclusive of linters (short lengths). The acreage of Indian corn in 1926 was 1,918,000 and the crop was 36,826,000 bushels. The only other cereal of economic significance was oats, which had a yield of 1,386,000 bushels. Dairying and early vegetable growing are rapidly becoming important industries.

BY COURTESY OF THE BUREAU OF RECLAMATION

A TURPENTINE FOREST, NEAR BUSSFIELD, MISSISSIPPI

In 1925, the number of farms was 257,228, of which 107,086 were operated by whites and 150,142 by negroes. There was a decrease both in the number of farms and the farm acreage as compared with 1920. There was a slight increase in the relative amount of tenantry during the period of 1920–25. Of the total number of farms in 1925, 80,808 were operated by owners and part owners, 175,742 by tenants, and 678 by managers. The live stock on the farms on Jan. 1, 1928, comprised 106,000 horses, 336,000 mules, 1,269,000 cattle and 878,000 swine.

Mississippi, in 1924, ranked second among the Southern States in lumber production, which in 1924 was valued at $92,033,335 and was the greatest in the history of the State, and turpentine and resin were produced to the value of $3,408,879. The legislature in 1924 passed a law tending to promote reforestation.

Fishing is a minor industry, confined for the most part to the Mississippi sound and neighbouring waters. The most valuable branches are the oyster and shrimp fisheries. In 1926, the production was 202,668 standard cases of canned oysters worth $966,521, and 163,962 standard cases of shrimps and crabs worth $850,770.

The mineral wealth of the State is very limited. Lack of mineral resources, especially of coal and iron, and of a good harbour, until the improvement of Gulfport, discouraged manufacturing.

The 1,705 industrial establishments operating within the State in 1925 gave employment to 55,171 wage-earners and had a product valued at $200,453,028. Compared with 1923 these figures show an increase in the number of industries and wage-earners and an increase of $22,381,870 in output. The chief products and their values were as follows: lumber and other timber products, $95,-734,039; cotton seed oil, cake and meal, $25,215,846; planing mill products, $14,656,705; cotton goods, $6,431,273; construction and repair done in steam railway shops, $6,264,710; wood preserving, $5,274,577; and turpentine and resin, $4,010,022. Laurel, Jackson, Meridian, Hattiesburg and Vicksburg were the industrial centres.

Except for the artificial harbour of Gulfport, the water along the Gulf coast is too shallow for any but small boats. The Gulf and Ship Island Railroad Company, with the co-operation of the U.S. Government, in 1901 began to dredge a channel 300 ft. wide and 19 ft. deep at mean low tide, and to construct an anchorage basin at Gulfport, ½ m. long by ¼ m. wide and 19 ft. deep. By June 1908, the maximum low water draft of the channel and the basin was 19 ft., but since that time it has been increased to 23 feet. Gulfport is the chief shipping point for Mississippi lumber and also exports much cotton. Along the western border of the State, the Mississippi river is navigable for river steamboats. The first railway in Mississippi was completed from Woodville, Miss., to St. Francisville, La., in 1837, but the State had suffered severely from the panic of 1837, and in 1850 it had only 75 m. of railway. In 1924 the total was 4,207 miles. There were 6,721 m. of highway under the control of the State highway department at the end of 1926. Of this total, 3,839 m. were classified as surfaced.

History.—At the beginning of the 16th century the territory included in the present State of Mississippi was inhabited by three powerful native tribes: the Natchez in the S.W., the Choctaws in the S.E. and centre, and the Chickasaws in the north. In addition, there were the Yazoos in the Yazoo valley, the Pascagoulas, the Biloxis and a few weaker tribes on the borders of the Mississippi sound. The history of Mississippi may be divided into the period of exploration (1540–1699), the period of French rule (1699–1763), the period of English rule (1763–81), the period of Spanish rule (1781–98), the territorial period (1798–1817), and the period of statehood (1817 *et seq.*).

Hernando de Soto (*q.v.*) and a group of Spanish adventurers crossed the Tombigbee river, in Dec. 1540, near the present city of Columbus, marched through the north part of the State, and reached the Mississippi river in what is now Tunica county, Mississippi, in 1541. In 1673 a French expedition, organized in Canada under Jacques Marquette and Louis Joliet, sailed down the Mississippi to the mouth of the Arkansas. Nine years later (1682) René Robert Cavelier, sieur de la Salle, reached the mouth of the river, took formal possession of the country which it drains, and named it Louisiana in honour of Louis XIV. The first European settlement in Mississippi was founded in 1699 by Pierre Lemoyne, better known as Iberville, at Ft. Maurepas (Old Biloxi) on the east side of Biloxi bay, in what is now Ocean Springs, Jackson county. The site proving unfavourable, the colony moved to Twenty-seven Mile Bluff, on the Mobile river, in 1702, and later to Mobile (1710). The oldest permanent settlements in the State are (New) Biloxi (*c.* 1720), situated across the bay from Old Biloxi and nearer to the Gulf, and Natchez or Ft. Rosalie (1716). During the next few years Ft. St. Peter and a small adjoining colony were established on the Yazoo river in Warren county, and some attempts at settlement were made on Bay St. Louis and Pascagoula bay. The efforts (1712–21) to foster colonization and commerce through trading corporations established by Antoine Crozat and John Law failed, and the colony soon came again under the direct control of the king. In 1729–30 the Natchez tribe destroyed Ft. St. Peter and some of the small outposts.

At the close of the Seven Years' war (1763) France ceded to Great Britain all her territory east of the Mississippi except New Orleans, and Spain ceded Florida to Great Britain. By a royal proclamation (Oct. 7, 1763) these new possessions were divided into East Florida and West Florida, the latter lying south of the 31st parallel and west of the Chattahoochee and Apalachicola rivers. Crown orders of 1764 and 1767 extended the limits N. to a line due E. from the mouth of the Yazoo at about 32° 28′ N. latitude. Under British rule there was an extensive immigration into this region from England, Ireland, Georgia, South Carolina and New Jersey. A settlement was made in 1772 by Richard and Samuel Swayze of New Jersey, 18 m. S.E. of Natchez and on the Big Black river 17 m. from its mouth; another in 1774 by Phineas Lyman (1716–74), of Connecticut; while settlements also were made by other "military adventurers," veterans of the Havana campaign of 1762. Spain took military possession in 1781, and in the Treaty of Paris (1783) both of the Floridas were ceded back to her. But Great Britain recognized the claims of the United States to the territory as far S. as the 31st parallel, the line of 1763. Spain adhered to the line of 1764–67, and retained possession of the territory in dispute. Finally, in the Treaty of San Lorenzo el Real (ratified 1796) she accepted the 1763 (31°) boundary, and withdrew her troops in 1798.

Mississippi Territory was then organized, with Winthrop Sargent as governor. The Territorial limits were extended on the N. to the State of Tennessee in 1804 by the acquisition of the west cessions of South Carolina and Georgia, and on the S. to the Gulf of Mexico by the seizure of West Florida in 1810–13, but were restricted on the E. by the formation of the Territory of Alabama in 1817. The Choctaws ceded their lands to the United States in 1820 and 1830, and the Chickasaws ceded theirs in 1832; and both tribes removed to the Indian Territory.

An enabling act was passed on March 1, 1817, and the State was formally admitted into the Union Dec. 10. The first State Constitution (1817) provided a high property qualification for governor, senator and representative, and empowered the legislature to elect the judges and the more important State officials. In 1822 the capital was removed to Jackson from Columbia, Marion county. The Constitution of 1832 abolished the property qualification for holding office and provided for the popular election of judges and State officials.

On the death of John C. Calhoun in 1850, the State, under the leadership of Jefferson Davis, began to rival South Carolina as leader of the Southern Constitutionalists in their defence of the rights of the States. There was a brief reaction: Henry Stuart Foote (1800–80), Unionist, was elected governor in 1851 over Jefferson Davis, the States' rights candidate, and in the same year a convention had declared almost unanimously that "the asserted right of secession . . . is utterly unsanctioned by the Federal Constitution." But the States' rights sentiment continued to grow.

An ordinance of secession was passed on Jan. 9, 1861, and the Constitution was soon amended to conform to the new Constitution of the Confederate States. During the Civil War battles were fought at Corinth (1862), Port Gibson (1863), Jackson (1863) and Vicksburg (1863). In 1865 President Johnson appointed as provisional governor William Lewis Sharkey (1797–1873), who had been chief justice of the State in 1832–50. A convention which assembled Aug. 14 recognized the "destruction" of slavery and declared the ordinance of secession null and void. The first meeting of the legislature after the war for southern independence was held Oct. 16, 1865, and at once enacted laws for the protection of the white people of the State, their homes and social order, laws which the North interpreted as an effort to restore slavery, but which, in fact were for the preservation of civilization. Under the reconstruction act of March 2, 1867, Mississippi with Arkansas formed the fourth military district, commanded successively by Generals E. O. C. Ord (1867), Alvan C. Gillem (1868) and Irvin McDowell (June–July 1868), and by Gillem (1868–69) and Adelbert Ames (1869–70). Under the latter the legally constituted civil officers of the State were ejected from office by military force.

The notorious "Black and Tan Convention" of 1868 adopted a Constitution which conferred suffrage upon the negroes, and by the imposition of test oaths disfranchised the leading whites. It was at first rejected at the polls, but was finally ratified in Nov. 1869 without the disfranchising clauses. The 14th and 15th amendments to the Federal Constitution were ratified in 1870, and the State was formally readmitted into the Union on Feb. 23 of that year.

From 1870 to 1875 the Government was under the control of "carpet-baggers," negroes and the most disreputable element among the native whites. Taxes were increased—expenditure increased nearly threefold between 1869 and 1871—and there was much official corruption; but the State escaped the heavy burden of debt imposed upon its neighbours, by reason of Constitutional inhibitions. The Democrats carried the legislature in 1875 and preferred impeachment charges against Gov. Adelbert Ames, who had been military governor (*see* above) and was a native of Maine, a graduate of the U.S. Military Academy (1861) and a soldier in the Union Army. The lieutenant governor, A. K. Davis, a negro, was impeached and removed from office; T. W. Cardoza, another negro, superintendent of education under Ames, was impeached on 12 charges of malfeasance, but was permitted to resign. Gov. Ames, when the impeachment charges against him were dismissed on March 29, 1876, immediately resigned. The whites maintained their supremacy and preserved their social system until the adoption of the Constitution of 1890 which disfranchised ignorance, venality and crime. The State has always been Democratic in national politics, except in the presidential elections of 1840 (Whig) and 1872 (Republican).

Mississippi has remained mainly agricultural in interest in spite of legislative encouragement to industry. The loss of life and property by successive floods of the Yazoo and the Mississippi rivers led to the provisions in the Constitution of 1890 establishing two great levee districts, the Yazoo-Mississippi delta and the Mississippi. Much had been done toward making the lowlands safe, but the unprecedented floods in the spring of 1927 proved the levees not sufficient.

A child labour law was passed in 1912. Under its provisions no child under 12 may be employed in any mill or factory and no child under 16 may be employed for more than eight hours per day. No employee is permitted to work in any mill or factory more than ten hours per day. The enforcement of this law is placed in the hands of the county health officer. The Torrens system of registration of land titles has been in force since 1915. A State highway commission was appointed in 1916.

Mississippi was the first State to ratify the 18th (Prohibition) amendment, doing so Jan. 8, 1918. The legislature, however, refused to ratify the 19th (woman suffrage) amendment in 1919, and it took no action on the proposed 20th amendment regarding child labour. The State flower is the magnolia and the State motto is *virtute et armis*. The State has a flag as the emblem of her sovereignty.

Lowe, *Mississippi: Its Geology, Geography and Soils* (Mississippi geological survey, *Bulletin 12*) and in the reports of the *U.S. Geological Survey* (consult the various bibliographies). (D. R.)

MISSISSIPPI GULF COAST TO CHICAGO HIGHWAY (Magnolia Route), an American highway connecting Chicago with the Gulf of Mexico at Bay St. Louis, Miss., just east of New Orleans, La. It is about 1,050 m. long and the most direct road in this region. It runs almost due north and south and serves Terre Haute, Ind., Madisonville, Ky., Clarksville, Tenn., Tupelo, Laurel and Gulfport, Miss.

MISSISSIPPI RIVER (Algonquin, *Missi Sipi*, or "great river"), the central trunk of the great river system draining that part of the United States which lies between the Appalachian Mountains on the east and the Rocky Mountains on the west. Together with over 40 tributaries which are navigable for at least part of their courses it forms one of the great inland navigation systems of the world. Over 15,000 m. of waterway are capable of being used for commercial transport purposes. The entire area drained by the river and its tributaries is about 1,240,000 sq.m., or over one-third the area of the United States. Over this drainage area there is an average annual precipitation of 29·8 in., of which about one-fourth ultimately finds its way to the sea via the Mississippi. The total annual discharge at its mouth is estimated at 785,190,000,000 cu.yd., and the total amount of sediment carried into the Gulf annually is about 406,250,000 tons.

The Mississippi river rises in the lake region of northern Minne-

sota and flows in a southerly direction to the Gulf of Mexico. Its ultimate headspring has been found in Little Elk lake about 2,560 m. from its mouth, though the exact distance varies with a shifting river bed The river valley may be conveniently divided into the Upper Mississippi and the Lower Mississippi, the confluence with the Missouri, the longest tributary, being the dividing point. Like the Missouri and the Ohio, the Upper Mississippi may then be thought of as merely a chief tributary to the Lower Mississippi, and the contributions of the three most important branches may be compared as follows:—

River	Drainage area in sq.m.	Average annual rainfall	Per cent of rainfall draining off	Per cent of final discharge of Mississippi supplied
Missouri	530,000	20·9	15	14
Upper Mississippi	171,500	35·2	24	18
Ohio	202,000	41·5	24	31

These three rivers thus represent 63% of the Mississippi's discharge at the Gulf. Below the mouth of the Ohio the chief tributaries are the Arkansas and Red rivers with extensive drainage basins (187,000 and 93,000 sq.m. respectively) and the St. Francis and Yazoo with much smaller basins, but with a far heavier rainfall, of which almost 75% finds its way to the Mississippi. The Missouri river flows 2,950 m. from the Rocky Mountains before it enters the Mississippi and, if to its length is added the 1,250 m. of the Lower Mississippi, the combination of the two forms the longest river in the world.

From its source at a comparatively slight elevation (1,670 ft. above sea-level) to its mouth the incline of the Mississippi river proper is gentle and almost uniform. Its upper course is through many marshes and lakes, and its valley south to the Falls of St. Anthony at Minneapolis is shallow and young, lying on a bed of glacial deposit through which it has cut but slightly. Entering the driftless area below the Falls of St. Anthony its trench becomes deeper and all the way to Cape Girardeau, Mo., its bed lies 400 to 600 ft. below the level of the surrounding prairies. This valley trench is 2 to 6 m. wide, with a comparatively level floor, and is bordered by abrupt bluffs, mostly wooded, but often crowned above their talus slopes with precipitous limestone and sandstone cliffs which add greatly to the beauty of the region.

This trench was cut in pre-glacial times, and its rock floor, as determined by well borings, was then 100 to 200 ft. below the present river bed and a little steeper in its incline toward the south. The outwash of glacial sand and gravel later filled the trench to, or slightly above, its present level. During the retreat of the ice the Mississippi carried a much greater volume of water than at present. Glacial Lake Agassiz in the valley of the Red river (of the North), with its natural northern drainage blocked by ice flowed southward through the Minnesota river into the Mississippi. Likewise the Great Lakes, their St. Lawrence outlet dammed, drained into the Mississippi; Lake Superior by the St. Croix river, Lake Michigan by the Illinois, and Lake Erie by the Wabash and other rivers.

From Cape Girardeau southward the highlands fall back to a much greater distance from the Mississippi and the river flows through an alluvial plain of its own making. Only at two points on the west—New Madrid, Mo., and Helena, Ark.—and at several points on the east—Columbus and Hickman, Ky., the Chickasaw bluffs and various localities between Vicksburg and Baton Rouge —do the hills approach the river banks. These places are important for they offer the chief sites for towns and cities. Elsewhere the river banks are unstable, for the river itself is constantly shifting—islands becoming peninsulas, peninsulas becoming islands, slight bends becoming in time long meanders, and these in turn becoming old river channels with crescent-shaped lakes as the river again cuts across its peninsula. From Cape Girardeau to the Gulf in a straight line is about 600 m., but by the windings of the Mississippi it is almost 1,700 m. From the Ohio to the head of the delta the river steadily diminishes in width from 1,500 to about 800 yd., but increases in depth from an average of 50 to over 100 feet.

As the river flows through its alluvial plain it builds natural embankments or levees along its immediate shore. These natural levees are higher than the remainder of the flood plain, the fall-away to the inland averaging 7 ft to the first mile. Often the bed of the river actually lies higher than the surrounding country. The natural levees have been supplemented by artificial levees which are relied upon to protect the country from floods. These serve for the lower floods, but there are few high floods where the bank is not cut and a crevasse opened at some weak spot through which the waters pour over the lowland plantations.

REPAIRING A BREAK IN A LEVEE ON THE MISSISSIPPI RIVER

The levees cease with the arable lands, beyond which, in the delta, the land lies too low for cultivation. The delta, built up of the enormous amount of sediment brought down by the river, extends out into the Gulf in the pattern of a goose foot. Over this great mud plain, the river spreads, breaking up into branches or "passes," as they are locally known, each of which in turn extends far out into the water where it has built up its own smaller delta. On the farthest banks nothing grows except the tall reeds which give a little cohesion to the mud. There are five chief openings, South-west pass, South pass, South-east pass, North-east pass and Pass à l'Outre. At different times shifting conditions made steamers use first one pass and then another, but after 1878 engineering works made South pass the principal entrance.

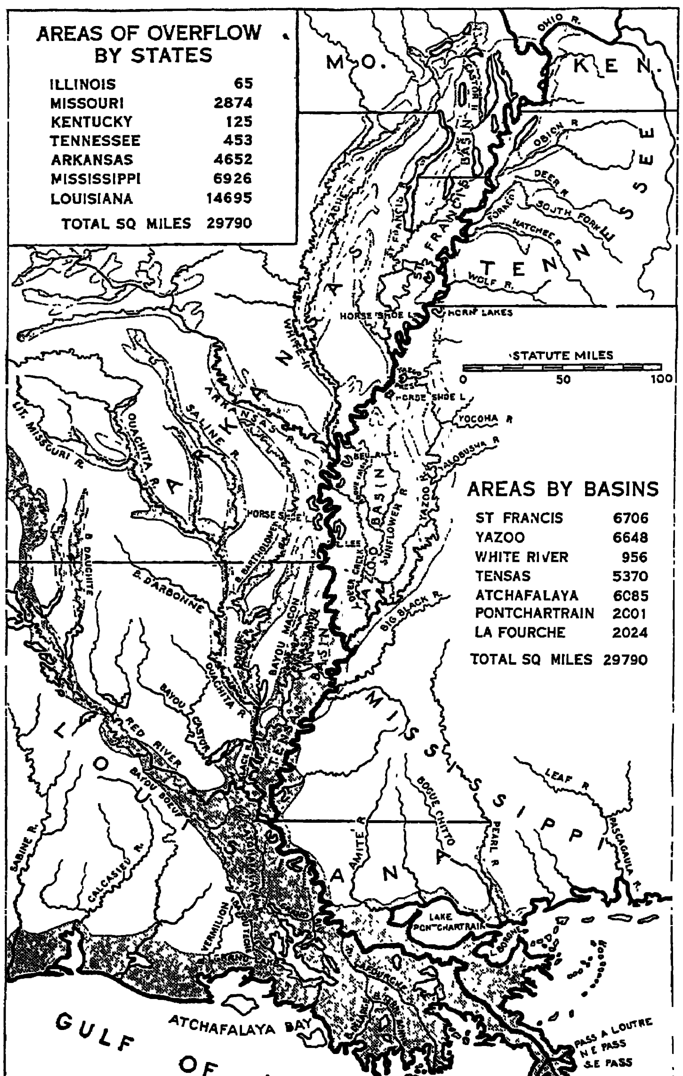
The volume of water carried by the Mississippi varies greatly with the seasons. Usually the river is lowest in early autumn and again in early winter. A minor rise in November is generally checked by the freezing of the upper tributaries. In January a rise again commences, as a consequence of early rains from the Gulf which sweep over the upper Ohio valley before the frost leaves the ground, and carry along with them the melting snows of the mountains. Unless the Ohio river contributes its general spring flood, it is rare that a large Mississippi flood follows. The Upper Mississippi has its heaviest rainfall in May and its waters and those of the Missouri do not reach Cairo at the mouth of the Ohio until the crest of the Ohio flood has passed. It is when the waters of the upper Mississippi are unusually early, or rainfall precipitates a second flood in the Ohio valley, so that the two crests meet, or one precedes but slightly and holds back the other, that a great flood occurs. The comparative height of floods is more accurately measured at Cairo than at lower points where the levels may be artificially affected by crevasse breaks. A height of 50 ft. or more above low water at Cairo generally results in a major flood which the levees are not capable of withstanding. Before the great flood of 1927 the record height was 54·69 ft. in 1913. The flood of 1927, the highest on record, registered 56·4 ft. at Cairo.

This great flood lasting more than six weeks with 47 recorded levee breaks, inundated about 28,000 sq.m. and submerged the homes of 750,000 people. Over 600,000 people were rendered destitute and were temporarily dependent upon the American Red Cross and other relief agencies for shelter, food and medical attention. Property and other flood losses were finally fixed at $355,147,000. Expenditures of the Red Cross were more than $14,000,000 and those of the Federal Government during the six

weeks were estimated at $5,000,000. As a result of the catastrophe, flood relief legislation by Congress became an urgent matter, and in Dec. 1927, President Coolidge submitted to that body the flood-control plan of Major-general Jadwin, chief of army engineers, calling for expenditures on the Lower Mississippi totalling $296,400,000. (X.)

ENGINEERING

The engineering of the Mississippi river has two purposes, viz., improvement of its navigation and control of its floods so as to protect the adjacent alluvial lands from overflows. Both the work for navigation and that for flood control have always been executed by U.S. army engineers. Until 1928, the Mississippi River Commission, composed of three army engineers and four civilians, directed the work which was executed under the supervision of engineer officers of the army. Since 1928 the commission



Map of areas along the Mississippi river subject to overflow

has directed the work as before but it has done so under the supervision of the chief of engineers of the army and the direction of the secretary for war. Some theories link the flood control structures and the navigation improvements together and claim that the control of floods causes the flood waters to improve navigation channels by their own action. It is true that bank revetments serve to prevent bank caving which keeps earth out of the river channel and also saves levees from caving into the river. These revetments, therefore, serve both navigation and flood control. However, although some structures serve both purposes, it is not proved that the flood waters themselves are forced to effect any material improvement of the navigable channel.

Navigation.—The Mississippi river has its source in numerous lakes in the northern part of Minnesota, its origin being traced to Little Elk lake. It flows in a southerly direction about 2,560 m. into the Gulf of Mexico. The navigation in the vicinity of the headwaters of the Mississippi has been improved by six reservoirs and by dredged cut-offs. The six reservoirs are, Winnibigoshish, Leech lake, Pokegama, Sandy lake, Pine river and Gulf lake. They have a combined storage capacity of 93,662,-093,290 cubic feet. The construction of the reservoirs has resulted in a greater channel depth and more uniform flow in the Mississippi river above Lake Pepin, 52 m. below St. Paul, Minn., and has made possible continuous navigation during the season on some stretches above St. Paul, where formerly it was subject to interruption on account of low water, and has assisted navigation at and immediately below St. Paul. Computations have indicated that under the system in operation in 1928 the reservoirs can produce an average increase in gauge height of 1·5 ft. at St. Paul during low-water season. The reservoirs also are of value in mitigating the effects of floods in the river above St. Paul.

Dredged cut-offs above Lake Pokegama and the partial closing of auxiliary channels by suitable dams have brought about the more rapid transmission of water from Lake Winnibigoshish and Leech lake reservoirs to the Pokegama distributing reservoir, and thus made it available for more prompt release there when needed. At the site of the Twin City lock and dam near Minneapolis, the discharge of the Mississippi varies from 1,000 to 54,000 second feet. The river in this section has an average slope of 5 ft. per mile and an average width of 700 feet. This lock and dam have extended navigation to the Washington Avenue bridge, Minneapolis, Minn., 1,944 miles above the mouth of the Mississippi with a low water depth of 6 feet. It will make possible the direct shipment of flour and grain from Minneapolis to the Gulf of Mexico by water and of coal and other bulky freight from down-river points to Minneapolis. The improvement has also made possible the development, under licence from the Federal Power Commission, of water-power with a maximum installed capacity of 18,000 horse power.

The project depth for the navigable channel of the Mississippi, from Minneapolis south to the northern boundary of the city of St. Louis is 6 feet. This stretch is improved principally by regulating works but it includes the Twin City lock and dam at Minneapolis, the lock and dams at Moline and at Smith island in the Rock Island rapids, the lock and dam at Keokuk, Ia., and a lock and dam under construction near Hastings, Minn. The distance from the head of navigation at Minneapolis to the mouth of the Missouri is 669 miles. From the mouth of the Missouri to the northern boundary of St. Louis it is 6 miles. The low water discharge at St. Paul, Minn., is 2,500 sec.ft., and above the mouth of the Missouri it is 20,000 second feet. The highwater discharge at Rock Island, Ill., is about 250,000 second feet. The current is gentle except on the Rock Island rapids, the average fall being 0·576 ft. to the mile; on the rapids 1·48 ft. to the mile. The width between banks varies from 1,000 ft. at St. Paul to about 5,000 ft. at the mouth of the Missouri river. The navigable channel throughout the 675 m. referred to above has been improved by regulating works, by dredging and by the locks and dams mentioned. The regulating works consist of spur dikes by which the low-water channel is made sufficiently narrow to force the low-water flow to scour its own channel 6 ft. deep. This low-water channel varies in width from 200 ft. to 1,400 ft. between the Illinois and Missouri rivers. The spur dikes have a crest elevation of 4 ft. above low water above Quincy, Ill., and 6 ft. above low water below Quincy to the Missouri river.

The spur dikes generally consist of piles of stone extending out from the banks either perpendicular to the bank or in some cases oblique to the bank. Where necessary the bank at the starting point of a dike is paved with riprap. The dikes in many cases are built of a layer of brush, then a layer of stone, until the desired height is obtained. In some cases dikes consist of two rows of piles tied together, with brush and stone in between. On

LEVEES AND FLOODED AREAS OF THE MISSISSIPPI RIVER

1. Land side of a levee when the Mississippi River is at high water. Seepage water goes through the levee, but a sub-dyke, built of sand bags, retards disintegration. A circle of sand is shown which encloses a sand boil. The head of water within the sand bags prevents the seepage water from transporting the sand out of the levee and consequently destroying it

3. Another aeroplane view of the flood area
4. Revetment work in the lower Mississippi River carried on by U.S. Government engineers. Mat being woven. These mats are used in protecting the bank under water from erosion. Mattresses of willow and other timbers as well as slabs of concrete are used as revetments

the bottom there may be a mat through which the piles are driven. The regulating works are assisted in their action, where necessary, by dredging in order to maintain the low-water depth of 6 ft. throughout the navigable season. In a relatively few places rock excavation has been made to form the channel desired. The lock and dam at Keokuk as well as dry-dock, buildings, etc., were built by the Mississippi River Power Company and turned over to the Government free, in return for power rights given to that company. The dimensions of the lock in the clear are 380 by 110 ft. with a lift of 41 ft. at extreme low water. The dry-dock is 380 by 170 ft., with entrance gates 110 ft. wide.

From St. Louis, Mo., to Baton Rouge, La., the existing project provides for a channel not less than 300 ft. wide and 9 ft. in depth. This channel is to be secured and maintained by contraction works and by dredging. Below the mouth of the Missouri river, the banks of the Mississippi are not as stable as above the Missouri so that the type of regulating work used in the lower river generally is different from that used in the upper stretches of the river. From St. Louis to Cairo, Ill. (the mouth of the Ohio river) the Mississippi has been improved by spur dikes consisting of four rows of piles tied together, extending into the stream perpendicular to the banks. The banks at the bases of the spur dikes are revetted with riprap and mattresses for a distance of 100 ft. or more above and below. A mattress is placed on the bottom of the river through which the piles are driven. Brush or brush and stone are placed between the piles. The current is checked by the dike and deposit from the current builds up the structure. The contraction of the river by these works causes the necessary depth to be scoured in the channel between the outer ends of dikes or between the outer ends of dikes on one side and the bank of the river on the other side. Banks which thus form one side of the channel are made stable by mattresses below low water and paving on the bank above low water.

The above-described contraction works are aided and supplemented by dredging. During the low-water season suction dredges move from bar to bar and dredge out the navigable channel wherever it has shoaled to less than 9 ft. in depth. These dredges are generally self-propelling and have been developed to a very efficient status. Below the mouth of the Ohio river (Cairo, Ill.) dredging has been used in the past more than contraction works for the maintenance of channels, but contracting spur dikes and bank revetments are being extended southward so as to reduce the amount of maintenance by dredging that has been necessary in the past. As the Mississippi flows southward it becomes larger and larger from the inflow of tributaries, the maintenance of a low-water channel 9 ft. in depth becomes less and less difficult, and the places where either contraction works or dredging are necessary become farther and farther apart. From Baton Rouge to New Orleans, La., a channel depth of 34 ft. or more over a least width of several hundred feet has obtained naturally in the river, although there has been occasional shoaling to a depth between 28 and 34 ft. in one or two short stretches. The existing project for this stretch of the river (132 m. long) provides for a channel 35 ft. deep at low water and 300 ft. wide to be maintained by dredging. No work has been necessary so far to maintain this channel, and work will rarely be necessary.

From New Orleans, La., to the Head of the Passes (about 94 m.) through which the Mississippi flows into the Gulf of Mexico, the natural channel is generally sufficient for ocean-going vessels. Of the several outlets into the gulf, two, the South pass and the South-west pass, have been improved and require continuous improvement for navigation. The South-west pass is 19·8 m. long. It is improved by contraction works and dredging. The existing project provides for a channel 1,000 ft. wide and 35 ft. deep. The general plan of improvement provides for contracting the lower 8·3 m. of the pass to a width of 1,750 ft. by means of jetties, spur dikes, and inner bulkheads; for dredging the channel between the bulkheads and depositing the dredging material between the bulkheads and jetties; for dredging a channel through the outer bar inclining to the left of the jetty axis; for the construction of small revetted openings through the narrow portions of the banks of the pass for the purpose of strengthening these banks; for the closure of minor outlets; for the construction of sills to prevent the enlargement of gaps and other outlets; for dredging in the river at the Head of the Passes; and for other minor work. The jetties are composed of a substructure of brush mattresses surmounted with a superstructure of concrete or large riprap. Spur dikes are composed of cribwork of round piling filled with willows and stone or with a curtain of round piles along the upstream face.

The South pass (3 m. long and 750 ft. wide) has been improved by similar works and its navigable depth has been increased from 9 to 30 ft. at the mouth and from 13 to 36 ft. at the Head of the Passes so that larger and deeper draught vessels are permitted to enter.

Flood Control.—The lands bordering the course of the Mississippi river below the vicinity of Rock Island, Ill., some 1,550 m. above the mouth have always been subject to overflow from floods, and man has sought to protect these fertile lands and make use of them for agriculture without incurring the damage incident to overflows. From Rock Island south to Cape Girardeau, Mo., on the west side and to Cairo, Ill., on the east side (about 500 m.) the lands bordering the river, subject to overflow, are comparatively narrow, and their protection is not as vital as is the protection of the alluvial valley proper, south of Cape Girardeau. These comparatively narrow lands are generally from 3 to 5 m. wide, while the broad alluvial valley south of Cape Girardeau is some 50 m. wide and about 600 m. long in a direct line (1,000 m. by river).

From the earliest times protection against floods has been secured in varying degrees by levees along the river. The inhabitants first constructed their own local protection by throwing up earthen mounds around their individual plantations. Then there were combinations of owners and communities, which protected, by levees, larger areas. Levee districts were formed and chartered in each State until there were about 27 of these districts in the alluvial valley proper, in addition to those north of the valley. For many years the U.S. Government carefully refrained from accepting any responsibility for flood protection. Then in 1879, the Mississippi River Commission was formed by the Federal Government and charged with making surveys and studies of the Mississippi river. For years thereafter the primary function of the Federal work was the improvement of navigation with flood control incidental. It was claimed and assumed that the levees and bank revetment for flood control improved the navigable channel and that the United States had no responsibility except for this purpose. More recently legislative acts have frankly authorized Federal money to be spent for flood protection without regard to navigation.

For many years the funds of the United States could not be spent for levees unless local interests contributed a material proportion of the cost. Local contributions were turned over to Federal authorities who did the work. The local contributions to the work in the alluvial valley have been reduced until now local interests provide only rights of way for levees on the main river. North of the alluvial valley proper and on tributaries subject to backwater, local interests provide rights of way and contribute one third the cost. During the 30 years that the Federal Government has been actively engaged in improving the Mississippi river, many theories have been advanced for its improvement. These have always aimed at using the force of the water to accomplish the desired results. It cannot be denied that in certain ways this is possible and that to some extent it is practicable and has produced some desired results. But never have the results been as great as expected, nor have they been proved conclusively.

The theory which has had the most advocates, and which has been actually tried to the greatest extent is that of "levees only" or that an alluvial stream tends to make a channel to accommodate itself, that its confinement by levees would cause the flood waters to scour out a channel large enough to accommodate flood flows. The confinement of the waters of the Mississippi by levees has substantially raised the flood heights. Even if the "levees only" theory be correct, it does not solve the problem, because the

floods must be controlled before there has elapsed enough time for such a theory to work out. The water must be provided for now and after extreme stages are provided for, a possible future enlargement in size of channel is of little practical value. A gradual filling of the banks of the river between the levees and the growth of the islands in the river tend to counterbalance scour in the channel proper.

Several thousand cross-sections of the river measured from time to time do not show any material change in the channel itself. Although the confinement of the river between levees has caused large increases in flood heights, it has not caused as yet any cumulative changes in the elevation of the river bed itself. The bed and natural banks of the river are continually undergoing the local changes found in any alluvial stream subject to a widely varying discharge, but the gross effect of these changes on the discharge capacity of any considerable section of the river proper, since the construction of levees, is so small as to be less than the limits of accuracy of measurement. After a review of all the evidence, it is concluded that neither the levees nor the crevasses that have occurred in them have had any measurable effect on the capacity of the channel of the river itself to carry off flood waters.

It is not necessary to discuss the effect of a spillway system on the discharge capacity of the river. Before the construction of levees, water spilled generally over the banks in every flood. There is no evidence that spilling has yet permanently affected the regimen of the river. The river channel is made and maintained by the river flowing the year round below the bank-full stage. If the periods of overflow lasting only a limited time could be confined, they would not for an extremely long time, if at all, affect appreciably the results of the channel-forming processes operating continuously. Unproved theories concerning the river channel as affected by levees or relief spillways have no practical bearing on plans for flood relief.

Flood relief by means of reforestation or by reservoirs has no place in practical flood control for the alluvial valley of the Mississippi. Reforestation could not possibly have more than an incidental and very minor effect on reducing flood stages. When the Mississippi watershed was in its original state of virgin forests, there occurred floods probably as great as those of modern times. Reservoirs at the headwaters of all tributary streams would not store the water that falls in the valley itself. Reservoirs in the valley as well as at the headwaters would have an appreciable effect in reducing floods in the valley but their cost is prohibitive.

The practical way to provide for flood control of the Mississippi river is to permit the flood waters of excessive floods to spill out of the main channel at selected points when stages reach the danger point. Then this water must be allowed to flow to the Gulf of Mexico through the most efficient natural drainage basins. The overflows into these basins must be limited by natural ridges or by secondary levees whose location is determined on the economic basis of how much value they protect, after protection of life is provided for. The water within the river channel does no damage and flows to the gulf with the utmost efficiency because of its high velocities. It should be kept within the channel as long as possible. The excess above the safe-carrying capacity of the main channel must be spilled through safety valves.

Protection Planned.—The existing project adopted in 1928 provided for protecting the good lands bordering the Mississippi against the maximum flood predicted as possible. This flood was predicted by the best experts on the subject who said that it might occur on the average only once in two hundred years. It is a flood which, if confined, is computed to produce a stage of from 63 to 66 at Cairo, Ill. (corresponding to a discharge of from 2,250,000 to 2,450,000 sec.ft.); a stage if confined, of 74 at Arkansas City (corresponding to an outflow of about 2,850,000 sec.ft.), and a flood with a discharge at the mouth of Red river of about 3,000,000 second feet. Above Cairo, Ill., the project flood is to be confined between the river-side levees since it can be thus confined with levees not of excessive heights (about 20 ft.). Opposite Cairo, Ill., the river bank levee on the west side of the river is to be lowered to elevation corresponding to 55 on the Cairo gauge, and a new levee is to be constructed about 5 m. back at elevation corresponding to 60 on the Cairo gauge. With this set-back floodway available the stage of the project superflood will be held to one foot below the elevation of the top of the main line levees in this locality. From New Madrid south to the Arkansas river the superflood is to be confined within the river-side levees. Just below the Arkansas there is to be a fuse plug or relief levee some 35 or 40 m. in length with crown elevation generally about 3 ft. below the top of the river-side levee grades. This situation is to be brought about by leaving the present levee in the vicinity of Arkansas City at its existing height, from 35 to 40 m. in length, and raising all other levees 3 feet. The good lands in the Tensas basin on the west side are to be protected against water flowing over the top or through the fuse plug section by levees and natural ridges that will bound the Boeuf river bottom southwards to below Sicily island, where the backwater area at the mouth of the Red river begins. Below the mouth of Red river there will be another fuse plug section at the head of the Atchafalaya basin consisting of the existing levee at its present height. The main river levee lines other than the fuse plug section will be raised about 3 feet. In the Atchafalaya basin there will be protecting levees to confine the water to the lowlands and to protect the good lands. Just above New Orleans, near Bonnet Carre, there will be a controlled spillway emptying into a floodway about 5 m. long and some 1 to 2 m. wide which will empty into Lake Pontchartrain. The main river at Cairo will carry about 1,900,000 sec.ft. and the set-back floodway about 450,000 second feet. At Arkansas City the main river will carry about 1,950,000 sec.ft. and the balance will go down the Boeuf basin. At the latitude of the mouth of the Red River the main river will carry about 1,500,000 sec.ft. and the balance can go down the Atchafalaya basin. At Bonnet Carre 250,000 sec.ft. can be taken out of the main river leaving 1,250,000 sec.ft. to go by New Orleans at a stage of 20 or under.

The floodway from Cairo to New Madrid will have a minimum width of 5 miles. The width between the protecting levees in the Boeuf basin will be from 10 to 25 m. and in the Atchafalaya basin from 12 to 25 miles. The excess waters that will flow through the fuse plug sections and down the lowlands in the side basins will rarely, if ever, be as much as the amounts used in computing the protection to be provided in these basins. The levees that will protect the valley against the superflood will have a section that will be ample to include the line of saturation and will vary with the material and foundations in different localities. For loam (the predominating material) the section will generally have a river-side slope of 1 on $3\frac{1}{2}$, a crown of 10 ft. and a land side slope which will include a line of saturation, starting from the river-side slope at an elevation of 1 ft. below the crown elevation and running back with a slope of 1 on $6\frac{1}{2}$. The levees will vary in height generally from 20 to 25 ft., with greater heights where they cross depressions.

For the protection of the levees against caving banks the same kind of revetments that are used for navigation works are used. These are made either of brush or concrete. Below the low-water line a flexible mattress is sunk to lie on the sloping bottom. Above the low-water line the bank is paved with one man stone or concrete usually laid on a gravel base. The flexible mattresses are built on barges and slid into the water, where they are anchored over their location until they are sunk in place by dumping rock on them from barges. The banks above the mattresses are graded by hand or by hydraulic jet to the slope desired and then paved. The brush mattress consists of willows with diameters of from 1 to 4 in. woven with galvanized iron cable into facines and the facines are woven into a continuous mat all in one operation. The flexible concrete mats are of concrete slabs reinforced with galvanized wire and connected together by galvanized cable.

(E. JA.)

HISTORY

Hernando de Soto, an early Spanish explorer, discovered the lower course of the Mississippi river in 1541. The Spaniards

did not follow up his discovery and there is no further record of white men on the river for 132 years. In 1673 two French explorers, Louis Joliet (*q.v.*) and Father Marquette went from Lake Michigan by the Fox-Wisconsin river route to the Mississippi and were probably the first white men on the upper course. They voyaged south to the mouth of the Arkansas. In 1682 La Salle (*q.v.*) entered the Mississippi by the Illinois route and was the first to explore it southward to its mouth. There he took formal possession of the entire drainage basin of the Mississippi for France, naming it "Louisiana" in honour of Louis XIV. Under his orders Michel Accault voyaged northward from the mouth of the Illinois as far as the Falls of St. Anthony in Minnesota, thus completing for France the exploration of the greater part of the river. French settlements were founded at Cahokia and Kaskaskia, Illinois, *c.* 1700 and New Orleans, 1718.

By the treaty of Paris (1763) that part of the Mississippi valley east of the river (except the site of New Orleans on the east side of the river) was transferred from France to England, while the remainder of the valley was secretly ceded to Spain. The United States by the treaty (1783) at the close of the Revolutionary War secured title to the British portion. To the settlers already crossing the Alleghenies in great numbers the Ohio and Mississippi rivers furnished the most natural outlet for their products. Floating these down the river on rafts and flat-boats to New Orleans where they might be transferred to ocean vessels was much cheaper than carrying them overland across the mountains. To these settlers Spanish control of both sides of the river at New Orleans was a continual annoyance. A treaty with Spain in 1795 secured for Americans the right to deposit goods while they were awaiting transfer to ocean ships, but in 1802 the Spanish Intendant closed the river to all navigation by Americans. In the meantime Spain had transferred Louisiana to France. Indignation in the trans-Allegheny settlements was running so high that President Jefferson authorized Robert Livingston to treat with Napoleon in an effort to purchase enough territory to secure for the United States control of the outlets of the Mississippi. The unexpected result was the accession of the entire territory of Louisiana, comprising the entire western drainage basin of the river.

Early traffic down the Mississippi was mostly by barges or keel-boats, and the return trip was rarely attempted. However, the chief rush of immigration into the Mississippi valley luckily coincided with the introduction and development of the steamboat. Only four years after Fulton made his memorable journey up the Hudson river, the first steamboat came puffing down the Mississippi. Thirty years later the steamboat period was at its zenith; 30 years more and it had declined before the competition of east-west railways. This was a gay and colourful period in the history of the river, one which furnished later writers with many a theme for romance. It is impossible to overemphasize the concrete contribution made by the steamboat to the development of the Mississippi valley, for waiting for the completion of railways would have postponed its general settlement for a generation. Besides the numerous freight steamers the picturesque, well-equipped passenger steamers were a notable feature of the period.

During the Civil War the operations of the western division of the Union army were largely devoted to securing control of the Mississippi. Land operations from the north were supplemented by the brilliant naval operations of Farragut from the South, and finally, with the fall of Vicksburg and Port Hudson, the Confederacy was cut in two and President Lincoln was able to announce that "The Father of the Waters again goes unvexed to the sea." There was some revival of Mississippi commerce after the Civil War, but in addition to the increasing inroads of railways, it was checked by the bar at the mouth of the Southwest pass. Relief was obtained through the Eads jetties at the mouth of South pass in 1879, but still steamboat companies did not prosper.

Commerce.—Until recent years river transportation was in itself of secondary importance, but the river still served and will continue to serve in an important rôle as an effective check to high railway rates. For such non-perishable articles as steel and coal where bulk is large and delivery is not urgent, the river is again coming to the fore as a carrier. Traffic now takes the form of tugs which guide or tow trains of modern steel barges, one tug economically handling a load which would require 400 to 600 freight cars. During the World War the U.S. Government established a line of boats as a common carrier between St. Louis and New Orleans, which was after the war incorporated as the Inland Waterways Corporation. Though at first it was run at a loss it began in 1924 to produce a substantial profit. In 1926 the Mississippi carried a freight burden amounting to 691,637 tons on the upper river between Minneapolis and the Missouri, 1,005,979 tons between the mouths of the Missouri and Ohio rivers, 1,660,188 tons between the Ohio and Memphis, 4,792,780 tons between Memphis and Vicksburg and 11,074,488 tons from Memphis to New Orleans. Exports to foreign countries from the port of New Orleans amounted to 10,091,594 tons, imports to 5,654,859 tons, coastwise traffic to 766,883 tons. Together with internal receipts and shipments up the Mississippi, exports and imports of the port were valued at a grand total of $945,458,088.

MISSOLONGHI or **MESOLONGHI** (Μεσολόγγιον), the chief town of the province of Acarnania-and-Aetolia, Greece; on the N. side of the Gulf of Patras, about 7 m. from the coast; pop. (1928) 9,270; notable for the siege which Mavrocordato and Botzaris sustained in 1822 and 1823 against a Turkish army 11,000 strong, and for the more famous defence of 1825–26. Byron died here in 1824, and is commemorated by a cenotaph.

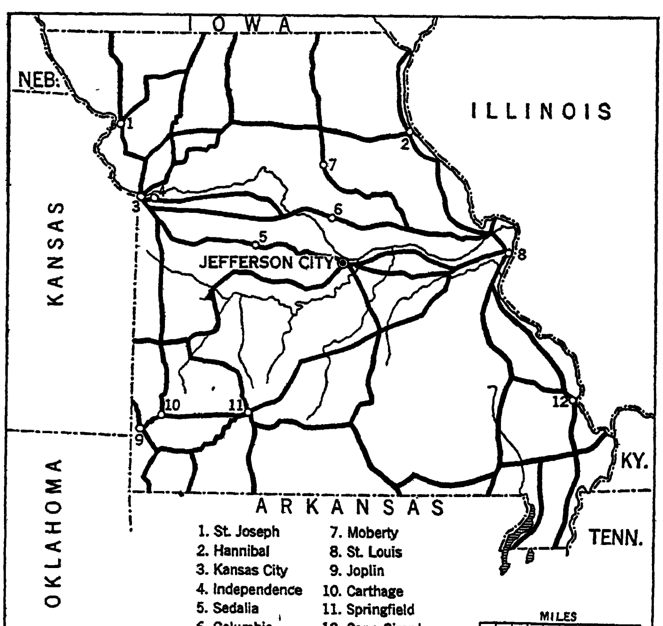
MISSOULA, a city of western Montana, U.S.A., on the Clark Fork of the Columbia river, at the mouth of the Bitter Root; the county seat of Missoula county, the seat of the State university, and the metropolis of the western part of the State. It is on Federal highways 10 and 93, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Northern Pacific railways. Pop. (1920) was 12,668 (86% native white); 1930 Federal census 14,657. The city lies on a broad plain (the bed of a glacial lake) 3,223 ft. above sea-level. The steep eastern wall of the valley is formed by Mount Jumbo and University mountain (Mount Sentinel), which rise abruptly over the city; and 5 or 6 m. to the west is the Bitter Root range. The university (opened in 1895) occupies a campus of 100 ac. at the foot of Mount Sentinel. Its property is valued at $2,250,000. The enrolment in 1927–28 was 2,272. Affiliated is the Montana School of Religion (organized 1924). On the Bitter Root river, 2 m. S.W. of the city, is Ft. Missoula, one of the important military posts of the mountain region; and 18 m. west is the Flathead Indian reservation. The city has railroad shops, an oil refinery and other manufacturing industries, with an output in 1925 valued at $3,870,703. The first settlement in this region was made in 1841, when Father De Smet founded the Mission of St. Mary where Stevensville now stands (30 m. S. of Missoula). The area now covered by Missoula county was included in the Territory of Oregon from 1848 to 1853, in the Territory of Washington from 1853 to 1863, in Idaho Territory for part of 1863 and of 1864, and became a part of Montana when that territory was organized in 1864. The city was founded in 1865 and incorporated in 1883. Settlers were so isolated that the result of the presidential election of Nov. 1856, was not known until the following April.

MISSOURI, popularly known as the "Show Me" State, occupies a central position in a group of 17 States which comprise

the great agricultural plain of the Mississippi valley. It is situated about 900 and 1,600 m. respectively from the Atlantic and Pacific coasts and approximately midway between Canada and the Gulf of Mexico. It is bounded on the north by Iowa; east by Illinois, Kentucky and Tennessee; south by Arkansas; and west by Oklahoma, Kansas and Nebraska. Its length from north to south, disregarding the St. Francois projection southward, is about 285 m., the width from west to east varies from 210 to 310 m., and the total area of the State is approximately 69,420 sq.m. of which approximately 693 are water surface. The State takes its name from its great river, the Missouri, which was named after a tribe of Indians who inhabited the country near the river mouth. The highest recorded elevation in the State is Taum Sauk mountain (1,750 ft.) in Iron county, and the lowest is on the flood plain of the Mississippi river in the south-east corner of Pemiscot county (229 ft.). The approximate mean elevation for the State is 800 feet.

Physiographic Regions.—Missouri is divided into four distinct physiographic regions: the old, glaciated and river plains, and the maturely dissected or Ozark highlands. The old plains region occupies about one-fifth of the area of the State, and is situated south of the Missouri river and west of the Ozark highlands. This topographic condition extends for a considerable distance into the adjoining States of Kansas, Oklahoma and Arkansas. It is underlain by shales, sandstones and limestones of Pennsylvanian and Mississippian age and is a region of topographic old age.

The glaciated plains occupy the major portion of the State north of the Missouri river. This region is underlain mainly by Mississippian and Pennsylvanian rocks and glacial and loessal deposits. Rocks belonging to earlier Paleozoic periods occur along the Missouri, Mississippi and other rivers. Pre-glacial features were similar to those now present in the old plains region. Post-glacial erosion has developed a topography characterized by extremely



MAP SHOWING THE MAIN ROADS OF MISSOURI

shallow valleys along the streams, and flattish inter-stream areas.

The river plains are flat areas varying in width from less than a mile to as much as 8 or 10 m. along the main streams, but in the south-eastern area the river plain is from 30 to 60 m. wide.

The Ozark highland, in Missouri, is a part of a highland area of considerable extent lying in the States of Illinois, Missouri, Arkansas and Oklahoma. It is underlain by pre-Cambrian igneous rocks and by sedimentary rocks ranging from Cambrian to Pennsylvanian in age, with Cambrian and Ordovician rocks underlying most of the region. Occupying in Missouri about two-fifths of the State, the Ozark highlands are distinguished by greater elevation and a more completely dissected surface. The general shape of the highland is an elongated dome, whose longer axis extends from the vicinity of St. Francois county south-westward across the State into north-central Arkansas. In the east is an area of granite knobs, peaks and ridges covering some 70 sq.m., commonly called the St. Francois mountains, which are only from 500 to 800 ft. above the adjacent valleys. In the south-western part the surface is rougher and more elevated continuing into Arkansas. The highlands are noted for their swift, clear streams abounding in game fish.

Climate.—The climate is characteristically "humid continental with long summers." As a rule the number of sunshine days is more dependable during each season than either rainfall or temperature. Summer months (June, July, August) have from 18 to 25 sunshine days, winter months (December, January, February) have from 12 to 18. The average winter temperature is 29° F. Summer average is 76° F. The yearly average of rainfall is 38 inches. Some 12 to 15 in. fall during spring in State-wide rains. Summer rain of about 7 in. is in showers. Autumn periods of four to six weeks of fine dry weather are common. Extended periods during autumn are calm. Extremely warm humid days in summer may result in destructive tornadoes. The growing season averages 178 days.

Geology.—The geological history of Missouri ranges from pre-Cambrian to the present time. The oldest known rocks, which are exposed in the south-eastern part of the State in the region of the St. Francois mountains, are of igneous and metamorphic origin and include granites, porphyries and schists. Their exact age is unknown. A long period of erosion followed their formation before the first advance of the Paleozoic seas in late Cambrian time. These Paleozoic seas spread around and upon the old pre-Cambrian igneous masses during their advances over the State, and their deposits represent every period of the Paleozoic era except the Permian. All of Missouri except a small area in the extreme south-eastern part and possibly a small area in the north-western part has probably been above the sea and subject to erosion since post-Pennsylvanian time, as no Mesozoic rocks have been found in the State and later marine deposits occur only in the south-eastern part. The presence of Cretaceous deposits in neighbouring States indicates, however, that late Mesozoic seas may have extended into south-eastern and north-western Missouri. Large glaciers advanced from the north late in Cenozoic time and extended south of the Missouri river. These glaciers modified the topography considerably and left a mantle of drift over the northern part of the State on their retreat.

Soils.—The soils of Missouri present a wide variation. The soils of the northern part of the State were derived mainly from glacial and wind-blown materials, with the greater relative amount of rich loessal soils along the Missouri and Mississippi rivers. The west-central part of the State is underlain mainly by residual soils derived from the weathering of limestones and shales but contains alluvial soils. The east-central and Ozark regions of Missouri are in the main stony and gravelly and best suited to the raising of live stock, but finer and more productive soils occur along the Mississippi and Missouri river valleys and in the smaller stream valleys. These soils are derived from the weathering of limestones, dolomites and igneous rocks of the Ozark region and from loessal and alluvial materials. The lowlands of south-eastern Missouri are underlain by loamy soils derived from water-deposited materials. The loams are of sand and clay, and when cleared of timber and well drained, are fertile.

Government.—Three Constitutions, framed by conventions in 1820, 1865 and 1875, have been adopted by the people of the State, and a fourth (1845) was rejected. A Constitutional Convention holding sessions during 1922–23 formulated and submitted to a special election on Feb. 26, 1924, 21 constitutional amendments, but all the more important proposals were rejected.

In addition there was the body chosen in 1861 to decide the question of secession, which retained supreme though irregular control of the State during the Civil War, and some of whose acts had the force of promulgated constitutional amendments. The present Constitution (that of 1875) was a notable piece of work

when framed. The term of the governor and other chief executive officers, which had been four years until the adoption of the Constitution of 1865, under which it was two years, was restored to the long term. Various effective checks were placed upon legislative extravagance, and upon financial, special and local legislation generally. Among reform provisions, common enough to-day, but uncommon in 1875, were those forbidding the general assembly to make irrevocable grants of special privileges and immunities; and permitting the governor to veto specific items in general appropriation bills. The grand jury was reduced to 12 members, and nine concurring may indict. The township system may be adopted by county option, but has not been widely established, though purely administrative (not corporate) "townships" are an essential part of State Administration. St. Louis and Kansas City have adopted their own charters under constitutional provision. An amendment (1908) provides for initiative and referendum; emergency measures, and appropriations for the State Government, for State institutions and for public schools are exempt from referendum. The referendum may be ordered by the legislature or by a petition signed by at least 5% of the legal voters in each of two-thirds (at least) of the congressional districts.

The executive and administrative department in 1927 consisted of a governor, lieutenant governor, secretary of State, attorney general, treasurer, auditor and superintendent of public instruction, all elected for four years, and 54 State boards, commissions, departments and bureaux.

The general assembly is composed of a senate of 34 members and a house of representatives of 150 members. Senators are elected every two years for a four-year term; representatives are elected for a term of two years. Regular sessions of the general assembly meet at Jefferson City, the capital, in odd-numbered years.

The supreme court, in certain cases holding sessions in two divisions, is composed of seven justices elected for a term of 10 years. There are three courts of appeals known as the St. Louis, Kansas City and Springfield courts of appeals. Each court consists of three judges elected for a term of 12 years, one being elected every four years. The State is divided into 38 circuit court districts. The bureau of labor statistics maintains free employment bureaux in St. Louis, Kansas City and St. Joseph.

Population.—The first census taken (1810) of that part of the upper Louisiana Territory which later became Missouri, showed a population of 19,783. The population at other selected censuses was as follows: 66,586 in 1820; 383,702 in 1840; 1,182-012 in 1860; 2,168,380 in 1880; 2,679,185 in 1890; 3,106,665 in 1900; 3,293,335 in 1910; 3,404,055 in 1920 and 3,629,367 in 1930 (April 1st) a gain of 225,312 or 6·6%. The percentage of urban population (in centres of 2,500 or more) increased from 42·5% in 1910 to 46·6% in 1920. Of the total urban population 79·7% in 1920 was in the three cities of St. Louis, Kansas City and St. Joseph. The rural population showed an absolute decrease in both 1910 and 1920. The population of the chief cities was:

Cities	1930	1920	Increase 1920-30	1910
St. Louis	821,960	772,897	6·3	687,029
Kansas City	399,746	324,410	23·2	248,381
St. Joseph	80,935	77,939	3·8	77,403
Springfield	57,527	39,631	45·2	35,201
Joplin	33,454	29,902	11·9	32,073

The density of population in 1930 was 52·8 per sq.m., as compared with 49·5 in 1920. Of the entire population in 1920 only 5·2% were negroes; this was the same relative position they held in 1900. The foreign-born population was relatively small—186,026 or 5·8% of the white population in 1920. The chief foreign groups were Germans (55,776), Russians (18,769), Irish (15,022), Italian (14,609), English (10,400). Early settlers were mainly from Kentucky, Tennessee, Virginia and the old slave States. After the Civil War, Northerners began to enter the State in large numbers.

Finances.—The revenue, inelastic through constitutional limitations,[1] proved increasingly inadequate until the unpaid current obligations in 1917 totaled over $2,000,000.

Attempts to secure relief for special purposes such as schools and good roads by constitutional amendments had all failed. The general assembly in 1917 passed new indirect taxes, a State income tax, a corporation franchise tax, a direct inheritance tax, a "soft" drink stamp tax and the wholesale liquor-dealers' licences, which yielded together nearly $2,400,000 in 1917–19. These taxes, excepting the liquor licences, yielded $7,847,875 in 1926. To secure greater uniformity in taxation and increase revenue, the basis of assessed valuation was raised in 1921 to 100% of actual value. This raised the assessed valuation from $2,694,567,461 in 1920 to $4,920,926,179 in 1921; the rate was lowered from $1.80 to $1.00 per $1,000 in the respective years. The chief sources of the State road fund in 1926 were: bonds, a gasolene tax ($6,006,934), Federal aid ($3,924,191) and motor vehicle licences ($3,774,941).

Education.—The idea of providing a university and free local schools as parts of a public school system occurs in the Constitution of 1820 (and in the acts of Congress that prepared the way for Statehood); but the real beginning of the system dates from the acts of 1835 and 1839. Not much progress was made, however, until a law was passed in 1853 providing for the formation of small school districts and another law requiring a fourth of the general yearly revenue of the State to be distributed among the counties for schools. This provision was made regularly after 1855 (save in 1861–67), and since 1875 has rested on a constitutional provision. In the years after 1887 one-third of the total revenue was appropriated for the support of public schools. This source of revenue amounted to $1,618,341 in 1910 and $3,-365,521 in 1926. To this must be added $187,040, the interest on the State's common school fund of $3,159,000. The permanent county, municipal and township school funds amounted, in 1925, to $12,720,879. Of the total revenue for the support of the public schools about 92% is derived from local taxation. The estimated total expenditure for public schools from State and local sources rose from $13,905,188 in 1910 to $49,970,000 in 1925; the per caput expenditure, in 1925, based on population aged 5–17 years inclusive, was $57.82. The public school enrolment in the above year was 735,589, with 103,221 in high schools. In 1924 there were 53,116 pupils enrolled in the private and parochial schools within the State. Negroes and whites are segregated in all schools.

Among institutions of higher learning the University of Missouri at Columbia is the chief one maintained by the State. It was opened to students in 1841, and received aid for the first time from the State in 1867. Women were first admitted to the normal department in 1869, to the academic department in 1870 and soon afterward to all departments. The university attendance in 1927 was in excess of six thousand. Teachers colleges are maintained as follows: at Kirksville (1870), at Warrensburg (1871), at Cape Girardeau (1873), at Springfield (1906), at Maryville (1906), and there is a normal department in connection with the Lincoln university, for negroes, at Jefferson City. Lincoln university (opened in 1866 as Lincoln institute) is for negro men and women. The basis of its endowment was a fund of $6,379 contributed in 1866 by the 62nd and 65th Regiments U.S. Coloured Infantry upon their discharge from the service. Privately endowed colleges within the State in 1928 included 16 senior colleges and universities. Among these schools the greatest is Washington university in St. Louis, opened in 1857.

Charities and Corrections.—The charitable and correctional institutions of the State include hospitals for the insane at Fulton, St. Joseph, Nevada and Farmington; a school for the blind at St. Louis; a school for the deaf at Fulton; a colony for the feeble-minded and epileptic at Marshall; a State sanitorium for tubercular patients at Mount Vernon; a home for neglected and dependent children at Carrollton; a Federal soldiers' home at St. James, and a Confederate soldiers' home at Higginsville; the penitentiary at Jefferson City; a training school for boys at Boon-

[1]The Constitution of 1875 limited the State revenue to $.20 on $100 assessed valuation with the added provision that when the assessed valuation of the State should reach $900,000,000 the rate should not exceed $.15 on $100 valuation.

ville; an industrial school for white girls at Chillicothe; and an industrial home for negro girls at Tipton.

Agriculture and Live Stock.—The State as a whole is devoted predominantly to agriculture, but it is no longer of chief economic importance. The total farm population in 1925 was 1,094,037 or 31·4% of the State's total population. Of the area of the State 74·2% was included, in that year, in farms (32,640,-893 ac.); and of this 15,278,436 ac. was classified as crop land. The number of farms had decreased from 277,244 in 1910 to 260,473 in 1925; the average number of acres per farm was 125·3. The number of farms operated by owners decreased during 1920–25 from 185,030 to 174,381; tenantry increased from 28·8% to 32·6% during the same period. The aggregate value of all farm crops in 1926 was $276,400,000 as compared with $307,-560,000 for the average for the period 1921–26. The table below gives the production and value of the chief crops in 1926:—

Crop	Acreage	Product	Value
Indian corn	6,404,000	174,189,000 bu.	$118,449,000
Tame hay	3,147,000	3,569,000 tons	48,181,500
Wheat	1,391,000	21,282,000 bu.	26,389,680
Oats	2,077,000	41,540,000 „	17,447,800
Potatoes	81,000	6,480,000 „	11,016,000
Cotton lint	434,000	104,160,000 lb.	10,416,000
Sorghum forage	140,000	434,000 tons	4,340,000
Apples	..	5,015,000 bu.	5,172,900

Indian corn and abundant grasses give to Missouri, as to the other central prairie States, a sound basis for her live stock interests. In 1926 the live stock dairy and poultry products marketed had an estimated value of $357,040,890. The aggregate total for all farm products in 1926, including farm and pasture crops, wood used on farms and all live stock products, was $679,641,260. Live stock on farms on Jan. 1, 1927 was valued at $210,552,800.

Mining.—Lead, clay products, cement, coal and building stone were the most important mineral products of Missouri in 1925. In lead production in 1924, Missouri ranked first among the States with a product of 189,929 short tons worth $30,388,640. The lead-producing area is confined mainly to two districts, Franklin, Jefferson and St. Francois counties in south-eastern and Barry, Greene, Jasper, Lawrence and Newton counties in south-western Missouri. The so-called "Joplin district" of south-western Missouri and south-eastern Kansas produces a considerable part of the zinc mined in the United States. Some silver is found in connection with zinc and lead mining. In 1925 the State ranked second as a producer of raw clays. There are unlimited supplies of clay, shale and limestone, the three essential constituents of Portland cement, and in its manufacture the State ranked sixth in 1925. The cement product for that year was 8,164,000 bbl. valued at $14,822,000. In 1924 the total value of stone quarried was $4,961,333, mainly limestone. Coal is produced over a large area; its production being reported from 27 different counties in the central, northern and western parts of the State. The coal production for 1924 was 2,480,880 short tons valued at $8,154,000. Missouri, in 1925 ranked first among the States as a producer of barytes ($725,000), chiefly from Washington county.

Manufactures.—In manufacturing and mechanical pursuits Missouri leads all States west of the Mississippi, California excepted. The State's manufacturing activity is greatly diversified as is shown by the 144 separate industrial groups identified by the 1925 census of manufactures. This census showed 5,114 industrial plants operating within the State, giving employment to 194,959 wage earners and having an annual product of $1,607,-161,018. Twelve industries in 1925 had a product valued at more than $30,000,000 each. Of the total output in 1925, over 77% were made up by the products of St. Louis, Kansas City and St. Joseph. The table in the next column gives the 10 leading industries, based on value, in 1925. One of the exclusive industries of the State is the manufacture of corncob pipes. Missouri produces practically the world's supply of these. The main industry is slaughtering and meat packing, for the State is in the centre of a hog-raising area.

Industry	Number of plants	Value
Slaughtering and meat packing (wholesale)	47	$175,392,412
Boots and shoes	68	124,327,761
Motor vehicles	11	113,130,501
Flour and grain mill products	241	82,442,041
Foundry and machine shop products	225	49,420,214
Bread and bakery products	582	49,384,309
Printing and publishing newspapers and periodicals	387	43,327,824
Men's clothing	96	39,356,064
Electric machinery and apparatus	54	39,130,533
Construction in steam railway repair shops	64	37,892,002

Commerce and Transportation.—In commerce as well as in manufactures St. Louis is first among the cities of the State, but Kansas City also is one of the greatest railway centres of the country, and the trade with the South-west, which St. Louis once held almost undisputed, has been greatly cut into by Kansas City, the ports on the Gulf and the rapidly growing cities of Texas. There is still considerable commerce on the Mississippi from St. Louis to New Orleans. In 1906–07 there was notable agitation for improvement of the Missouri from Kansas City to its mouth, 398 m. distant. Estimates were made in 1907 for 6 ft. and 12 ft. channels from Sioux City to Kansas City, and from Kansas City to the mouth of the river. The project for a 6 ft. channel 200 ft. wide from Kansas City to the mouth of the river was adopted by Congress in 1912; it has since been modified slightly. Between June 1910 and June 30, 1926, $13,339,079 were expended on the project. A 4 ft. channel was then open for the entire distance. Steam railway mileage increased until 1915 when there were 8,275 m. lying within the State; by 1925 the mileage had decreased to 8,051. In 1925 there were 19 electric railway companies operating 1,145 m. of track in Missouri.

The State highway system dates from the Hawes Act (1917), passed to take advantage of the Federal aid, and the Centennial Road Act (1921). The latter outlined the system and provided for the expenditure of a $60,000,000 bond issue approved by popular vote in 1920. Automobile licence fees and a gasolene tax provide additional funds. Of the total mileage of 7,640 under the highway department, on Dec. 31, 1926, 3,375·8 m. had been surfaced. New surfacing laid during 1926 amounted to 823 miles.

HISTORY

French and Spanish Régimes.—The first permanent settlements in Missouri, St. Genevieve (*c.* 1735), at the crossing to the lead district in south-east Missouri, and St. Louis (1764), the headquarters for the Missouri river fur trade, were settled from the Canadian-French villages across the Mississippi, from which there was a large migration after the establishment of English control in Illinois in 1765. The Spanish régime, established in Missouri in 1771, left few traces on population, language or customs. After 1796 American immigration was encouraged to gain strength against an apprehended British attack from Canada; when the American flag was raised at St. Louis in 1804, three-fifths of the 10,000 inhabitants of the region were Americans, chiefly log-cabin pioneers. The French were in the villages of St. Louis, St. Charles, St. Genevieve and New Madrid. Negro slaves, introduced before 1730, numbered about 1,500. Lead and food-stuffs went down the Mississippi and peltries to Montreal.

Early American Period.—Under the Americans all the Louisiana Purchase (*q.v.*) north of the present State of Louisiana was attached to Indiana Territory in 1804, organized as Louisiana Territory in 1805, and the name changed to Missouri in 1812. A legislature with elective lower house was granted in 1812, the upper house was made elective in 1816. In 1818 the legislature petitioned for Statehood and in 1821 Missouri was admitted to the Union as a slave State under the Missouri Compromise (*q.v.*). The Indians were never a serious problem in Missouri, although the Sac and Fox from the north-east drove the outlying pioneers into blockhouses along the Missouri and upper Missouri during the war of 1812; they surrendered their claims in 1815–16.

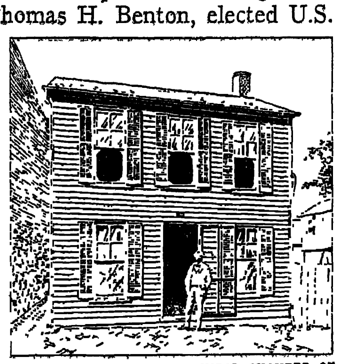
The population grew slowly until the great influx after 1815 to

the new areas along the upper Mississippi and the Boonslick country along the Missouri in the central part of the State. Of the 66,586 total population in 1820, nearly one-half were in these districts. In the succeeding decades the south-east filled in up to the Ozark section, the Missouri valley and the north-east were occupied until the two areas merged; the Platte Purchase in the north-west, annexed in 1837, filled up very quickly. The north-central section was settled later, in part from Iowa, while the south-west Ozark border lands, except around Springfield, and the Ozarks proper were sparsely settled even in 1860. Through 1850 the total population increased at the characteristic frontier rate, more than doubling in the '20s and '30s and increasing by three-fourths in each of the next two decades, reaching 1,182,012 in 1860. Until 1850 most of the settlers were of the Southern type, from Kentucky and Tennessee, or the back country of Pennsylvania, Virginia and the Carolinas. While Missouri had few plantations, the slave population kept proportional pace with the whites. Slavery was less economic than patriarchal.

The first steamboat reached St. Louis in 1816 and the Boonslick in 1819. The river transports carried out wheat, corn and meat products, as well as tobacco and hemp from the Missouri river counties, and the Missouri mule was early in evidence. St. Louis was the centre of the fur trade on the upper Mississippi and particularly on the Missouri; in the '20s the traders reached the Rocky Mountains and beyond. In the same decade began the overland trade with the Mexican hinterland at Santa Fe. When the Oregon trail was opened Missourians were the largest element of the early settlement in that territory; in the '40s began the exodus to California over the California trail. The starting point of these three transcontinental routes was at the great bend of the Missouri at Westport Landing (now Kansas City).

In 1831 the advance guard of the Mormons settled around Independence. As their numbers increased friction with the "Gentile" settlers developed and they were driven successively from Jackson and Clay counties. The legislature created a special county of Caldwell for them but with the arrival of their leader Smith and the main body of the church, they spread into the surrounding counties. In the end, in 1838–39, the antagonism became so acute that the militia were called out and after some skirmishing the Mormons withdrew to Nauvoo, Ill. (*q.v.*). Missouri furnished a large element in the early settlement of Texas. In the Mexican War Doniphan led a regiment of mounted militia to Santa Fe and went on to Chihuahua, finally reaching Taylor's army at the mouth of the Rio Grande. Two other Missouri regiments held Santa Fe throughout the war.

Early Politics.—In politics the national parties were organized slowly. The leading figure was Thomas H. Benton, elected U.S. senator in 1820 and re-elected until 1851. Missouri voted for Clay in 1824. In 1828 every county voted for Jackson, but not until 1836 was discipline and solidarity established in the Democratic Party. The Clay-Adams group supported candidates who were nominally Jackson men, but favoured the bank and the "American System" of Clay, thus electing Buckner senator (1830) and Ashley representative (1831–36). By 1839 the Whigs had developed a definite organization and party politics prevailed. The Whigs were to be found chiefly in St. Louis (the commercial element) and in the older richer slave-holding river counties; from 1836 to 1850 they were the minority party. Benton (*q.v.*) was defeated in 1851 but fought to regain control until his death in 1857, splitting the Democratic Party. Political confusion was increased in the '50s by the civil war in Kansas (*q.v.*) and the beginnings of the Republican Party.



BY COURTESY OF THE HANNIBAL CHAMBER OF COMMERCE
THE BOYHOOD HOME OF MARK TWAIN AT HANNIBAL, MISSOURI

During the decade 1850–60 St. Louis grew rapidly due to the development of the upper Mississippi country and the Southern trade; the Irish, German and free State immigration increased until these elements comprised two-sevenths of the total population in 1860. Slaves fell to one-tenth of the total population in this decade, the institution holding its own only in some 25 counties along the Mississippi and Missouri. Railway building was aided by State loans of over $23,000,000; and the Hannibal and St. Joseph was completed across the State. On the eve of the Civil War, Missouri was losing her Southern characteristics but the ruling classes had strong Southern traditions and sentiments, and the Benton fight had driven the Democratic leaders into a close alliance with the Southern wing of the party.

Civil War and Reconstruction.—In the presidential election of 1860, Douglas received the electoral vote of the State, the only one he carried in the Union. When the question of secession was submitted to the people in Feb. 1861, they elected a convention which voted 80 to 1 against immediate secession. But there was a very strong sentiment for compromise or even neutrality. The governer, Claiborne F. Jackson, indignantly repudiated Lincoln's call for troops, and intrigued to gain possession of the U.S. arsenal at St. Louis and to put the State on a war footing. Nathaniel Lyon and the Federal troops, with Blair's support, broke up an encampment of State militia at Camp Jackson, St. Louis, and began open hostilities with the driving of the governor out of Jefferson City. In August Lyon was defeated and killed by State and Confederate forces at Wilson's creek near Springfield, but next spring these forces were driven into Arkansas and defeated.

Meanwhile the convention re-assembled in 1861, ousted Governor Jackson and the legislature, and elected Hamilton R. Gamble provisional governor. Until his death in 1864 he maintained, with Lincoln's support, a loyal State Government accepted by the majority of Missourians, in the face of lack of funds and the impatience of Federal military authorities. In 1861 a minority of the fugitive legislature adopted an ordinance of secession and Missouri was admitted to the Confederacy. Gen. Frémont's emancipation proclamation issued at St. Louis in Aug. 1861 was promptly repudiated by Lincoln. However the convention after refusing Lincoln's plan of emancipation with compensation in 1863 enacted a plan of gradual emancipation. It also provided an oath of loyalty for officials and voters. Records show that 109,111 men were mustered into the Federal service while perhaps 50,000 served in the Confederate armies. In the election of 1864 the more radical elements swept the State and in 1865 a new convention abolished slavery immediately and without compensation. It also drew up a new Constitution which included an extremely rigorous test oath, covering in great detail all sympathy or indirect aid to the Confederacy, and imposed not only on voters but on professional men also. Although the latter sections were declared unconstitutional by the U.S. Supreme Court, the wholesale disenfranchisements and the rigid registration laws maintained the radicals in control until 1870. In that year Carl Schurz led a revolt of the more liberal Republicans and with the support of the reorganized Democratic Party elected B. Gratz Brown governor, repealing the test oaths. In 1872 the Democrats secured control of the State Government and retained it until 1908.

Economic and Industrial Progress.—Missouri emerged from this reconstruction period with a heavy debt, State and local, incurred in loans to the railroads and in war expenditures. The prostration of the South and the rise of Chicago injured St. Louis, while the prevailing economic depression was especially hard on the rural population. However, railways were extended, valuable zinc and lead deposits were discovered in south-west Missouri, and after 1880 the development of the South-western portion of the United States led to the rapid growth of Kansas City. Though hard hit in the panic of 1893, Missouri's economic and especially its industrial development since 1900 has been steady. Missourians were too interested in the reconstruction issues in the '70s to respond to the Granger movement, but the farmers' alliances of the '80s had a very large membership. Bryan and free silver swept the State in 1896 and 1900. Roosevelt, who endorsed many of the Populist ideals and appealed to the younger generation, carried Missouri in 1904, and Folk, the reform Democratic candidate, was elected governor. Since 1904 Missouri has

been a doubtful State politically, voting Republican in all presidential elections, including 1928, except 1912 and 1916, but frequently going Democratic in off-year State elections.

(J. Vi.)

MISSOURI COMPROMISE, an agreement (1820) between the pro-slavery and anti-slavery factions in the United States, involving primarily the regulation of slavery in the public territories. A bill to enable the people of Missouri to form a state government, preliminary to admission into the Union, came before the House of Representatives on Feb. 13, 1819. An amendment offered by James Tallmadge (1778–1853) of New York, which provided that the further introduction of slaves into Missouri should be forbidden, and that all children of slave parents born in the state after its admission should be free at the age of 25, was adopted by the committee and incorporated in the Bill as finally passed (Feb. 17) by the house. The Senate refused to concur in the amendment and the whole measure was lost. During the following session (1819–20), the house passed a similar bill with an amendment introduced by John W. Taylor (1784–1854) of New York making the admission of the state conditional upon its adoption of a constitution prohibiting slavery. In the meantime the question had been complicated by the admission, in December, of Alabama, a slave state (the number of slave and free states now becoming equal), and by the passage through the house (Jan. 3, 1820) of a bill to admit Maine, a free state. The Senate decided to connect the two measures, and passed a bill for the admission of Maine with an amendment enabling the people of Missouri to form a state constitution. Before the bill was returned to the house a second amendment was adopted on the motion of J. B. Thomas (1777–1850) of Illinois, excluding slavery from the "Louisiana Purchase" north of 36° 30′ (the southern boundary of Missouri), except within the limits of the proposed state of Missouri. The House of Representatives refused to accept this and a conference committee was appointed. There was now a controversy between the two houses not only on the slavery issue, but also on the parliamentary question of the inclusion of Maine and Missouri within the same bill. The committee recommended the enactment of two laws, one for the admission of Maine, the other an enabling act for Missouri, without any restrictions on slavery, but including the Thomas amendment. This was agreed to by both houses, and the measures were passed, and were signed by President Monroe respectively on March 3/6, 1820. On the constitutional side the Compromise of 1820 was important as the first precedent for the congressional exclusion of slavery from public territory acquired since the adoption of the Constitution, and also as a clear recognition that Congress has no right to impose upon a state asking for admission into the Union conditions which do not apply to those states already in the Union. The compromise was specifically repealed by the Kansas-Nebraska bill of 1854.

Woodburn, "The Historical Significance of the Missouri Compromise" in the *Annual Report of the American Historical Association* for 1893 (Washington, D.C.); Dixon, *History of the Missouri Compromise* (Cincinnati, 1899); Schouler's and McMaster's *Histories of the United States;* and *The Missouri Compromise and Presidential Politics, 1820–25,* from the letters of William Plumer, Jr., ed. E. S. Brown (St. Louis, 1926).
(W. R. Sm.)

MISSOURI PACIFIC LINES. The Missouri Pacific lines to-day comprise a system extending from St. Louis, Mo., west through Kansas City, north to Omaha and Lincoln, Neb., west of Kansas City to Pueblo, Colo., south-west from St. Louis through Little Rock and Texarkana, Ark., into Texas and south down the Mississippi valley to Memphis and New Orleans. They also include the Gulf Coast lines, which circle the Gulf of Mexico from New Orleans, through Beaumont, Houston, Galveston and Corpus Christi to Brownsville on the Rio Grande, as well as the International-Great Northern, which criss-crosses Texas in a great "X" from Fort Worth to Galveston and from Longview Junction to Laredo, through Austin and San Antonio.

In addition to these lines the Missouri Pacific owns a majority interest in the Texas and Pacific, which covers Texas from east to west, the line extending from New Orleans to El Paso, through the cities of Shreveport, Dallas and Fort Worth. The Missouri Pacific also owns jointly with the Western Pacific the Denver and Rio Grande Western.

The Missouri Pacific was originally known as the Pacific railway, construction of which was started at St. Louis on July 4, 1851. It was the first railroad constructed west of the Mississippi river. Later the Missouri Pacific formed the nucleus or basis of the transcontinental system the elder Gould undertook to assemble. The Missouri Pacific lines serve now virtually every portion of the Mississippi valley, west of the great river from Omaha south to the Gulf of Mexico and to the Rio Grande. In recent years the property has greatly developed. (L. W. B.)

MISSOURI RIVER, the principal western tributary of the Mississippi river, U.S.A. It is formed at Three Forks, in the Rocky Mountain region of south-western Montana, by the confluence of the Jefferson, Madison and Gallatin, thence it flows north into the plains, which it traverses in a course at first north-east, then east. Entering North Dakota, the river turns gradually to the south-east, then south, and again south-east, traversing both North and South Dakota. It forms the eastern boundary of Nebraska and, in part, of Kansas, and crosses Missouri in an easterly course to its junction with the Mississippi 17 m. above St. Louis, and 2,551 m. below the confluence of the three forks. The stream which is known as the Jefferson river in its lower course, Beaver Head river in its middle course and Red Rock creek in its upper course, is really the upper section of the Missouri; it rises on the border between Montana and Idaho, 20 m. W. of the western boundary of the Yellowstone National park, near the crest of the Rocky mountains, 8,000 ft. above the sea, and 394 m. beyond Three Forks, and with this and the Lower Mississippi the Missouri forms a river channel about 4,240 m. in length, the longest in the world. The Madison and Gallatin forks rise within the Yellowstone park, and the Yellowstone river, which is the principal tributary of the Missouri, traverses the park. The Missouri drains a basin having an area of about 580,000 sq.m., 2,550 sq.m. of which are in Canada.

Besides the Yellowstone and the three forks, there are the Platte, which rises in two large branches in Colorado, and the Milk, which rises in north-western Montana. The Kansas in Kansas, the James and Big Sioux in the Dakotas, and the Niobrara in Nebraska, are the principal tributaries wholly of the plains. In the mountain region the Missouri flows through deep canyons and over several cascades. Below Great falls the slower current is unable to carry all the silt brought down from the mountains and plains, and consequently a winding and unstable channel has been formed on deep deposits of silt. Bends in the river continue to develop by erosion until the neck between two of them is cut off, and in the process numerous islands, sand-

bars and crescent-shaped lakes are formed. Cottonwood, willow, cedar and walnut trees grow upon the banks that are for a time left undisturbed, but years later the eroding current returns to undermine these banks and the trees fall in and are carried down stream as snags, which are specially dangerous to navigation. The minimum discharge is 12,000 cu.ft. per sec. at Sioux City and 23,000 at Kansas City. The maximum discharge is about 200,000 cu.ft. per sec. at Sioux City and approximately 500,000 at Kansas City. The waters of the Missouri begin to rise in March, and a high water stage is reached in April, as a result of the spring rains and the melting snow on the plains; a second high stage is produced in June by the melting of the snow on the mountains. The fluctuation between extreme high and low water is 13·3 ft. at Pierre; 22·5 ft. at Sioux City; and at Kansas City 34·6 feet. The river is navigable to Fort Benton 2,285 m. above the mouth.

The mouth of the Missouri was discovered in 1673 by Marquette and Joliet, while they were coming down the Mississippi. Early in the 18th century French fur-traders began to ascend the river, and in 1764 St. Louis was established as a depôt; but the first exploration of the river, from its mouth to its headwaters, was made in 1804–05 by Meriwether Lewis and William Clark. Until many years later the commerce on the river was restricted to the fur trade, and was carried on with such primitive craft as the canoe, the pirogue, the bullboat, the mackinaw boat and the keelboat.

The first attempt to navigate the Missouri with steamboats was made in 1819. The American Fur company began to use steamers in 1830, and from then until the advent of railways the steamboat on the Missouri was one of the most important factors in the development of the North-west. The traffic was at its height in 1858, when no fewer than 60 regular packets were engaged in it, but its decline began in the following year with the completion of the Hannibal and St. Joseph railway to St. Joseph, Mo., and later on it had almost entirely disappeared. Various attempts have been made to revive river traffic in an effort to secure cheaper transportation for the valley.

The U.S. Congress has authorized the improvement of the Missouri for navigation, with a view to securing a navigable channel 6 ft. deep from the mouth to Sioux City, and for snagging, with some rock removal and bank protection to Fort Benton. The Government has spent about $26,000,000 on the section below Kansas City, about $3,000,000 on the section between Kansas City and Sioux City, and about $3,500,000 on the portion of the river above Sioux City. It is expected that a channel capable of being used for barge traffic will be available to Kansas City in 1930.

MIST: *see* Fog.

MISTAKE, a misconception or error in thought or action. For its legal significance *see* Contract.

MISTLE THRUSH (*Turdus viscivorus*), a well-known European thrush, the largest found in Britain. The popular and specific names suggest that the bird eats mistletoe berries. The name is also spelt missel thrush. (*See* Thrush.)

MISTLETOE (*Viscum album*), a species of *Viscum,* of the family Loranthaceae (*q.v.*). The whole genus is parasitical, and contains about 20 species, widely distributed in the warmer parts of the old world; but only the mistletoe proper is a native of Europe. It forms an evergreen bush, about 4 ft. in length, thickly crowded with forking branches and opposite leaves, which are about 2 in. long, obovate-lanceolate in shape and yellowish-green; the dioecious flowers, which are small and nearly of the same colour but yellower, appear in February and March; the white berry when ripe is filled with a viscous semi-transparent pulp (whence bird-lime is derived). The mistletoe is parasitic both on deciduous and evergreen trees and shrubs. In England it is most abundant on the apple-tree, but rarely found on the oak. Poplars, willows, lime, mountain-ash, maples, are favourite habitats. The fruit is eaten by most frugivorous birds, and through their agency the plant is propagated. The sowing is effected by the bird wiping its beak, to which the seeds adhere, against the bark of the tree on which it has alighted. The viscid pulp soon hardens, affording a protection to the seed; in germination the sucker-root penetrates the bark, and a connection is established with the vascular tissue of the first plant. The plant is slow in growth but it is very persistent, its death being determined generally by that of the tree on which it has established itself. The mistletoe so extensively used in England at Christmas is largely derived from the apple orchards of Normandy, but some from the apple orchards of Herefordshire.

The American mistletoe (*Phoradendron flavescens*), very similar to the European mistletoe, occurs on deciduous trees, especially on tupelo and red maple, from central New Jersey to Missouri and southward to Florida, Texas and New Mexico. The larger western form (var. *macrophyllum*), growing in bushy clumps 2 ft. to 8 ft. in diameter, is parasitic chiefly on poplars and willows from Texas to central California. The common mistletoe (*P. villosum*) of the Pacific coast occurs chiefly on oaks from Oregon to southern California and Arizona. Within the same range three other mistletoes are found: the cypress mistletoe (*P. bolleana*), with pearl-like berries; the juniper mistletoe (*P. juniperinum*), with scale-like leaves, growing on junipers and incense cedars; and the mesquite mistletoe (*P. californicum*), with slender, pendulous branches, parasitic on mesquite, creosote-bush and cat's-claw.

MISTRAL, FREDERIC (1830–1914), Provençal poet, was born at Maillane (Bouches-du-Rhône) on Sept. 8, 1830. In the autobiographical sketch prefixed to the *Isclo d'or* (1876) he tells us, with great simplicity and charm, all that is worth knowing of his early life. His father was a prosperous farmer, and his mother a simple and religious woman of the people, who first taught him to love all the songs and legends of the country. In these early days on the farm he received those first impressions which were destined to constitute one of the chief beauties of *Mirèio*. In his ninth year Mistral was sent to a small school at Avignon, where he was very wretched at first, regretting the free outdoor life of the country. Gradually, however, his studies attracted him, above all the poetry of Homer and Virgil; and he translated the latter's first eclogue, showing his efforts to a young schoolfellow, A. Mathieu, who was destined to play a part in the foundation of the Félibrige. When Roumanille (*see* Provençal Literature) became an usher at Mistral's school, the two, fired by the same love of poetry and of their native Provençe, soon became close friends. Returning to Maillane (1847) he sketched a pastoral poem in four cantos (*Li Meissoun*). With all his love for the country, he soon realized that life on a farm did not satisfy his ambition. So he went to study law at Aix, where he contributed his first published poems to Roumanille's *Li Prouvençalo* (1852). He had become *licencié en droit* the year before, but now decided on a literary career. The Félibrige was founded in 1854, and five years later appeared *Mirèio,* the masterpiece not only of Mistral, but so far of the entire school. The tale itself was nothing—the old story of a rich girl and her poor lover, kept apart by the girl's parents. Mireille, in despair, wanders along a tract of country to the church of the Trois-Maries, in the hope that the latter may aid her. But the effort was too great: she sinks exhausted, and dies in the presence of her stricken parents and her frenzied lover. Into this simple web Mistral has woven descriptions of Provençal life, scenery, character, customs and legends that raise the poem to the dignity of a rustic epic that is unique in literature. There is no deep psychology in the characters, but then the people depicted are simple rustic folk, who wear their hearts on their sleeve. But *Calendau* (1867), the story of a princess held in bondage by a ruthless brigand, and eventually rescued by a youthful hero, is a comparative failure. The description of scenery is again masterly; but the old lore, which had charmed all readers in *Mirèio,* here becomes forced, not inevitable. The characters are mere symbols—indeed

the whole poem is obviously an allegory, the princess standing for Provence, the brigand for France and the young lover for the Félibrige. Mistral lavished enormous labour on this work, which probably accounts for its lack of spontaneity, as also for the love he bears it. In 1876 (the same year in which he married Mlle. Marie Rivière, of Dijon) was published the volume *Lis Isclo d'Or* —a collection of the shorter poems Mistral had composed from the year 1848 onwards. Here he is again at his very best. Old legends, *sirventes* (mostly, as in mediaeval times, poems with a tendency), and lyrics—all are admirable. Even the *pièces d'occasion* may be reckoned with the best of their kind. Two pieces, the *Coupe* and the *Princesse*, aroused violent controversy on their first appearance. They reproduce, in effect, the theme of *Calendau*, and Mistral was accused of trying to sow discord between the north and south of France. He was altogether innocent of such a design. *Nerto* (1884) is a charming tale of Avignon in the olden days, in which a girl's purity triumphs over her lover's base designs and leads him to nobler thoughts. The play *La Rèino Jano* (1890) is a complete failure, if judged from the dramatic standpoint: it is rather a brilliant panorama, a series of stage pictures, and the characters neither live nor arouse our sympathy. In the great epic on the Rhone (*Lou Pouèmo dou Rouse*, 1897) the poet depicts the former barge-life of that river, and intertwines his narrative with the legends clustering round its banks, and with a graceful love episode. For the first time he employs blank verse, and uses it with great mastery, but again the ancient lore is overdone. A splendid piece of work is *Lou Tresor dou Félibrige* (1886). In these two volumes Mistral has deposited with loving care every word and phrase, every proverb, every scrap of legend, that he had gathered during his many years' journeyings in the south of France. In 1904 he was awarded a Nobel prize for literature.

In 1906 he published a Provençal translation of *Genesis* and *Olivades*, in 1912, a collection of Provençal poems. His memoirs appeared, under the title *Mes Origines*, in 1906. He died at Maillane, near Marseilles, March 25, 1914.

An excellent literary appreciation of the poet is that by Gaston Paris, "Frédéric Mistral" (originally in the *Revue de Paris* [Oct. and Nov. 1894]; then in *Penseurs et Poètes* [Paris, 1896]). More elaborate accounts are Welter, *Frédéric Mistral* (Marburg, 1899); and Downer, *Frédéric Mistral* (New York, 1901), with a full bibliography.

See P. Brousse, *Frédéric Mistral* (1903); E. Lefèvre, *Bibliographie mistralienne* (1903); H. J. Boeken, *Frédéric Mistral* (1910); J. Brochet, *Frédéric Mistral* (1910); J. Charles-Roux, *Le jubilé de Fr. Mistral* (1912); E. Ripert, *La versification de Frédéric Mistral* (1917); P. Lasserre, *Frédéric Mistral* (1918); J. Vincent, *Frédéric Mistral: sa vie et son influence* (1918).

MISTRAL, a strong, dry, cold local wind which blows from the north-west on to the shores of the Gulf of Lion, where in winter the warm air usually has a lower barometric pressure than that over the colder lands to the north. The wind is experienced over the whole of the north-west Mediterranean coastal land, but is most marked in the district of the Rhone delta, the record at Marseilles being 175 days in the year. The blowing of the mistral is accompanied by cloudless skies, brilliant sunshine, intense dryness and piercing cold. With any increase of the atmospheric pressure differences it develops into a wind of great violence.

MISURATA, a town of Tripolitania, Italian North Africa, 137 m. E.S.E. of Tripoli by road and 122 by sea. Pop. (1927) about 10,000. Situated on the Great Syrtis it is the second city in Tripolitania, the seat of the commissioner of the eastern district, and manufactures carpets and reed mats. Its port, an open roadstead, lies 7 m. E. at the north end of the salt marsh (Sebcha) of Tauorga, described by Strabo as about 40 m. long and nine wide. During the World War it was the capital of the ephemeral republic of Tripolitania, under the bandit Ramadan Sceteui.

MITAU: *see* JELGAVA.

MITCHAM, a suburb of London, in Surrey, England, 10 m. S. of London Bridge by rail. Pop. of the urban district (1931) 56,856. Mitcham Common covers an area of 480 acres. The neighbourhood abounds in market gardens and plantations of aromatic herbs used for scents, essences and chemicals.

MITCHELL, DONALD GRANT (1822–1908), American author, was born in Norwich, Connecticut, on April 12, 1822. He graduated at Yale college in 1841 and studied law, but soon took up literature. Throughout his life he showed a particular interest in agriculture and landscape gardening, which he followed at first in pursuit of health. He produced books of travel, volumes of essays on rural themes, of which *My Farm of Edgewood* (1863) is the best, sketchy studies of English monarchs and of English and American literature, and a character-novel entitled *Dr. Johns* (1866), etc.; but he is best known as the author (under the pseudonym of "Ik. Marvel"), of essays contained in the volumes *Reveries of a Bachelor, or a Book of the Heart* (1850), and *Dream Life, a Fable of the Seasons* (1851).

MITCHELL, JOHN THOMAS WHITEHEAD (1828–1895), English Co-operator, was born at Rochdale on Oct. 18, 1828. He was an illegitimate child, greatly attached to his mother, who, to support them, kept a small beerhouse and later let lodgings to workmen. Not only did poverty make his schooling irregular, but at the age of 10 or 11 he worked in a cotton mill from 6 A.M. to 7 P.M. On Sundays he attended classes to improve his reading and writing and to obtain some knowledge of less elementary subjects. Later he was employed in the warehouse of a flannel mill at 16/– a week, rising to be manager. When he was 22 he became superintendent of the Milton Road Congregational Sunday school, an office he held throughout his life. Through discussions at the Sunday school his interest in co-operation was aroused; he joined the Rochdale Pioneers Co-operative Society in 1853, and served on its management committee for several years. In 1869, he was elected a director of the Co-operative Wholesale Society—started in 1863, and its future still uncertain.

Hitherto, the ideal of Co-operators had been that manufacture should be carried on in self-governing workshops, the profits being divided amongst the workers. But a new principle had been introduced by the device of "dividend on purchase." This brought success to the Rochdale Pioneers and a rapid increase in the number of retail co-operative societies, while productive workshops were continually failing. By this device, the surplus on trading was returned to the consumers, and profit-making was eliminated. A system was thus inaugurated in which the consumers organized distribution and production for use, to supply their own needs. Mitchell was the first to understand the possibilities of this system and something of its underlying theory (of which the full implications were first shown by Mrs. Sidney Webb in 1891), and he believed that it could become co-extensive with the nation. The success of this "Rochdale" system in England, largely due to Mitchell, has led to its being copied in 36 countries, and these national movements comprise now (1928) over 50,000,000 individuals. Mitchell was appointed chairman of the Co-operative Wholesale Society in 1874; his business ability steered the C.W.S. through serious difficulties in the '70s, and under his chairmanship a strong financial position was built up, large developments in banking and manufacture being initiated.

Mitchell never married and in his later years lived alone, looked after by a devoted neighbour—a man he had befriended on release from prison. His income from Co-operative work never exceeded £170 a year. This practical idealist had built up, through "voluntary socialism," a great inheritance for his fellows, and so lived for what he called "the good of the body politic."

For accounts of Mitchell see *C.W.S. Annual, 1896* (Manchester), P. Redfern, *John T. W. Mitchell* (Manchester, 1923); Mrs. Sidney Webb, *The Discovery of the Consumer* (1828).

MITCHELL, MARIA (1818–1889), American astronomer, was born on Nantucket, Aug. 1, 1818. Her astronomical work began as assistant to her father, William Mitchell, in making astronomical observations. On Oct. 1, 1847, she discovered a telescopic comet (seen by De Vico, Oct. 3, by W. R. Dawes, Oct. 7, by Madame Rümker, Oct. 11). In 1865 she became professor of astronomy and director of the observatory at Vassar college; and in 1888 professor emeritus. She made photographs of the sun and a special study of Jupiter and Saturn. She died at Lynn, Mass., on June 28, 1889.

See Phebe Mitchell Kendall, *Maria Mitchell: Life, Letters and Journals* (1896); *In Memoriam* (1889), by her pupil and successor at Vassar, Mary W. Whitney; and a sketch by her brother, Henry Mitchell (1830–1902), himself a well-known hydrographer, in the *Proceedings* of the American Academy of Arts and Sciences, vol. xxv. (1889–90), pp. 331–343.

MITCHELL, PETER CHALMERS (1864–), British zoologist, was born at Dunfermline on Nov. 23, 1864, and was educated at Aberdeen university, Christ Church, Oxford and at Berlin and Leipzig. From 1888 to 1891 he was university demonstrator in comparative anatomy at Oxford, and for the next two years was organizing secretary for technical instruction to the Oxfordshire County Council. He was later appointed lecturer in biology at Charing Cross hospital and at the London hospital, and in 1903 secretary to the Zoological Society of London. He also did much useful work as a member of the committees on fishery investigations and on sleeping sickness. During the World War he was attached to the Imperial General Staff and in 1918 acted as liaison officer to the War Office and to the British War Mission. He was elected F.R.S. in 1906.

His publications include *Outlines of Biology* (1894), *The Biological Problem of To-day* (1896), *T. H. Huxley* (1900), *The Nature of Man* (1904), *The Childhood of Animals* (1912), *Evolution and the War* (1915) and various papers in *The Anatomical Journal, The Quarterly Journal of Microscopical Science*, etc.

MITCHELL, SILAS WEIR (1829–1914), American physician and author, son of a physician, John Kearsley Mitchell, was born in Philadelphia, Feb. 15, 1829. He studied at the University of Pennsylvania and in 1850 received the degree of M.D. from Jefferson Medical College. From the time of his Civil War experience as an army surgeon he was interested in nervous diseases, soon becoming an international specialist particularly renowned for his use of the "rest cure." In 1863 he wrote a clever short story, combining physiological and psychological problems, entitled "The Case of George Dedlow," published in the *Atlantic Monthly*. Thenceforward Dr. Mitchell divided his attention between professional and literary pursuits. He wrote over 100 medical monographs and articles, the topics varying from the venom of poisonous snakes to neurasthenia. His *Wear and Tear, or Hints for the Overworked* (1871) might be classed as a best seller of its day; and *Fat and Blood* (1877) was translated into many languages. As a man of letters Dr. Mitchell wrote juvenile stories, several volumes of respectable verse, and prose fiction, perhaps the best being his historical novels *Hugh Wynne, Free Quaker* (1897), *The Adventures of François* (1898) and *The Red City* (1908). Mitchell died in Philadelphia, Jan. 4, 1914, the recipient of many academic and scientific honours. Mitchell's *Complete Poems* were published in 1914.

See Beverly R. Tucker, *S. Weir Mitchell* (1914), and Anna Robeson Burr, *Weir Mitchell: His Life and Letters* (1929).

MITCHELL, SIR THOMAS LIVINGSTONE (1792–1855), Australian explorer, was born at Craigend, Stirlingshire, Scotland, on June 16, 1792. In the Peninsular War, he surveyed battlefields. As surveyor-general of New South Wales, he made four exploring expeditions between 1831 and 1845, and discovered the Peel, the Namoi, the Gwyder and other rivers, traced the course of the Darling and Glenelg, and was the first to penetrate into that portion of the country which he named Australia Felix. In 1851 he was sent to report on the Bathurst goldfields, and in 1853 he again visited England and patented his boomerang propeller for steamers. He died at Darling Point, Sydney, on Oct. 5, 1855.

His works include: *Geographical and Military Surveying* (1827); *Three Expeditions into the Interior of East Australia* (1838); *Journal of an Expedition into the Interior of Tropical Australia* (1848); an *Australian Geography*, and a translation of the *Lusiad* of Camoens. During his tenure of office as surveyor-general he published a map of the settled districts of New South Wales.

MITCHELL, a city of South Dakota, U.S.A., 70 m. W. by N. of Sioux Falls, on the high banks of the crooked James river, at an altitude of 1,322 ft.; the county seat of Davison county. It is on Federal highways 16 and 37, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Chicago, St. Paul, Minneapolis and Omaha railways. Pop. (1920) 8,478 (91% native white); 1930 Federal census 10,942. It is the centre of a rich agricultural area and the seat of Dakota Wesleyan university (Methodist Episcopal: established 1885). Its unique "corn palace," redecorated annually with corn, grains and grasses, is the scene of a harvest festival during the last week in September. Mitchell was founded in 1879 and chartered as a city in 1883.

MITCHELL, MOUNT, a peak of the Black mountains, a short cross range extending north from the Blue Ridge through Yancey county, North Carolina, in 35° 45′ 53″ N. and 82° 15′ 55″ W. It is the highest (6,684 ft. above sea-level) peak in the United States east of the Mississippi river. In the same region there are about a dozen summits above 6,000 ft., the noblest of them being Blackstock Knob (6,386 ft.), Big Craggy Mount (6,068 ft.) and Balsam Cone (6,645 ft.). The mountains of North Carolina were not subject to glaciation and are, therefore, covered with a mantle of soil to the top, except for rocky precipices. They are covered with hardwood and pine forests in the lower elevations, and in the upper parts with an unbroken mantle of spruce and balsam fir.

For elevation in North Carolina see *Precise Triangulation, Traverse and Leveling in North Carolina* (1924), which is special publication No. 101 of the U.S. Coast and Geodetic Survey.

MITE, a name applied to an order of small Arachnida, and to a coin of slight value. The coin was originally a Flemish copper coin worth one-third or, a smaller fraction of the Flemish *penning*, penny. It is an expression in English for a coin of the smallest value, from its use in Mark xii., 43.

In zoology, "mite" is the name for minute members of the class Arachnida (*q.v.*), which, with the ticks (*q.v.*), constitute the order Acari. The word "mite," however, is merely a popular term and does not connote a natural assemblage. Mites are spread from the arctic to the antarctic hemisphere, and inhabit land, fresh-water and the sea. Many are permanent parasites; others for part of their life only. The largest species reach half an inch in length; while the smallest, the most diminutive Arthropoda, are invisible to the naked eye.

Mites are divided into a number of families. The Bdellidae (*Bdella*) are free-living with long antenniform palpi. The large tropical forms above mentioned belong to the genus *Trombidium* of the family Trombidiidae. They are covered with crimson velvety hairs. The legs are adapted for crawling and the palpi are raptorial. They are non-parasitic in the adult; but immature individuals of a British species (*Microtrombidium Autumnale*) are parasitic. (*See* HARVEST BUG.) The Tetranychidae are related to the last. A well-known example, *Tetranychus telarius*, spins webs and is sometimes called the money spider. The fresh-water Hydrachnidae are generally red or green and globular in shape. Their legs are furnished with long hairs for swimming. The red appears to be a warning colour. The marine Halacaridae creep on seaweeds and zoophytes. The Gamasidae are free-living with a thick exoskeleton, and allied to the ticks (*q.v.*). The Oribatidae or beetle-mites are non-parasitic, and go through remarkable metamorphoses. The Sarcoptidae are mostly parasitic. Some, however, live in decaying substances, the best known being the cheese-mite (*Tyroglyphus siro*). An allied species (*T. entomophagus*) damages collections of insects by destroying the specimens. They may be exterminated by benzine.

The mites are parasitic upon mammals and birds. They belong to the four families, Gamasidae, Trombidiidae (*vide supra*), Sarcoptidae and Demodicidae. Most of the Gamasidae are free-living. The family, however, contains an aberrant genus, *Dermanyssus*, of which one species, "red-mite," *D. gallinae*, is found in fowl-houses, dovecotes and bird-cages. During the day they lurk in cracks and emerge at night. They do much damage to the birds by sucking their blood and by depriving them of rest. Birds are also attacked by many species of Sarcoptidae (*Pterolichus* and *Analges*) living on and between the barbules of the feathers. They are apparently harmless. *Epidermoptes* occur on diseased fowls and live on the skin at the base of the feathers where they cause an accumulation of yellowish scales. *Cytolechus* lives in the connective tissue round the respiratory organs, or in the air sacs. They also penetrate to certain internal organs, and give rise to tubercle-like nodules.

The cutaneous mites mentioned above, merely suck the blood or feed upon the feathers, scurf and desquamating epidermis. Some species, however, give rise to a contagious disease known as scabies or mange. These mites belong to the Sarcoptidae and Demodicidae. A variety of species are responsible for Sarcoptic mange, *Sarcoptes mutans* producing it in the feet of birds.

Feather scabies of poultry is caused by *S. laevis*. Three genera of Sarcoptidae, namely *Sarcoptes, Chorioptes* and *Psoroptes* cause mange or scabies in mammals, the mange produced by *Sarcoptes* being the most serious, because the females of the species *scabiei*, burrow beneath the skin and are more difficult to kill. Their multiplication is very rapid. The numerous forms described from different mammals are probably all merely temporary varieties of a single species. Mange, if taken in time, can be cured by applications of sulphur ointment. *Demodex folliculorum* gives rise to "Demodecic or follicular mange," which is difficult to cure on account of the deep situation of the parasites. These infest the hair follicles and sebaceous glands in man and other animals. They differ from those previously noticed in the reduction of their legs and the elongation of the abdomen. They occur on domesticated animals, as well as on mice and bats.

The family Eriophyidae or gall-mites produce in plants results analogous to those produced in animals by Sarcoptidae and Demodicidae. As in the Demodicidae the abdomen is elongate, but the Eriophyidae differ from all other mites in having lost the last two pairs of legs. The best known of the excrescences or galls which they produce are the nail-galls of the lime caused by *Eriophyes tiliae*. Many species have been described. They inflict considerable loss upon fruit-growers by destroying the buds of the trees.

MITFORD, MARY RUSSELL (1787–1855), English novelist and dramatist, only daughter of Dr. George Mitford, or Midford, was born at Alresford, Hampshire, on Dec. 16, 1787. She retains an honourable place in literature as the authoress of *Our Village* (1824–32), a series of sketches of village scenes and characters unsurpassed in their kind, and as fresh as if they had been written yesterday. Miss Mitford lived in close attendance on an eccentric father, refused all holiday invitations because he could not live without her, and worked incessantly for him except when she broke off her work to read him the sporting newspapers. Her writing has the charm of perfectly unaffected spontaneous humour, combined with quick wit and real literary skill. Miss Mitford met Elizabeth Barrett (Mrs. Browning) in 1836, and the acquaintance ripened into a warm friendship. The strain of poverty began to tell on her work, for although her books sold at high prices, her income did not keep pace with her father's extravagances. In 1837, however, she received a civil list pension, and five years later her father died. A subscription was raised to pay his debts, and the surplus increased the daughter's income. She died at Swallowfield, near Reading, on Jan. 10, 1855. Her father was a curious character. He first spent his wife's fortune then the greater part of £20,000 which his daughter won in a lottery at the age of ten.

Miss Mitford wrote poems in the manner of Coleridge and Scott (*Miscellaneous Verses*, 1810, reviewed by Scott in the *Quarterly; Christine*, a metrical tale, 1811; *Blanche*, 1813). Several of her plays were produced with success, notably *Julian* (1823), *The Foscari* (1826), *Rienzi* (1828), and *Charles I.* (1834). *Belford Regis*, a novel idealizing Reading, was published in 1835.

Her *Recollections of a Literary Life* (1852) is a series of *causeries* about her favourite books. Her talk was said by her friends, Mrs. Browning and Hengist Horne, to have been even more amusing than her books, and five volumes of her *Life and Letters*, published in 1870 and 1872, show her to have been a delightful letter-writer; *see* L'Estrange, *Life of Miss M. Russell Mitford* with letters (3 vols., 1869); W. Roberts, *Mary Russell Mitford, Her Life and Friendship* (1913).

MITFORD, WILLIAM (1744–1827), English historian, born at Beaulieu, Hants, on Feb. 10, 1744, the son of a barrister. He was educated under William Gilpin at Cheam and at Queen's College, Oxford. He then read at the Middle Temple. After his marriage (1766) with Fanny Molloy he retired to Exbury, where he occupied himself with Greek language and literature. After his wife's death in 1776 he spent much time abroad. He sat in the House of Commons with intervals, from 1785 to 1818. Mitford died at Exbury on Feb. 10, 1827. In addition to his *History of Greece*, he published a few smaller works, the most important of which was an *Essay on the Harmony of Language*, 1774. The style of Mitford is natural and lucid, but without the rich colour of Gibbon. Mitford was an impassioned anti-Jacobin, and his partiality for a monarchy led him to be unjust to the Athenians, and the appearance of Grote's work eclipsed Mitford's *History*. Clinton, in his *Fasti hellenici*, charged Mitford with "a general negligence of dates," though admitting that in his philosophical range "he is far superior to any former writer" on Greek history.

MITHILA, an ancient kingdom of India, corresponding to that portion of Behar lying N. of the Ganges, with an extension into Nepal, where was the capital of Janakpur. Its early history is obscure, but it has always been noted for its peculiar conservatism and the learning of its Brahmans. Maithili is a dialect of Bihari, with an archaic grammar and literature of its own.

MITHRADATES, less correctly MITHRIDATES, a Persian name derived from Mithras (*q.v.*), the sun-god, and the Indo-European root *da*, "to give," *i.e.*, "given by Mithras." The name occurs also in the forms Mitradates (Herod. i. 110) and Meherdates (Tac. *Ann.* xii. 10). It was borne by a large number of Oriental kings, soldiers and statesmen. The earliest are Mithradates, the eunuch who helped Artabanus to assassinate Xerxes I. (Diod. xi. 69), and the Mithradates who fought first with Cyrus the Younger and after his death with Artaxerxes against the Greeks (Xen. *Anab.* ii. 5, 35; iii. 3, 1–10; iii. 4, 1–5), and is the ancestor of the kings of Pontus. The most important are three kings of Parthia of the Arsacid dynasty, and six (or four) kings of Pontus. There were also two kings of Commagene, two of the Bosporus and one of Armenia (A.D. 35–51).

Kings of Parthia.—MITHRADATES I. (Arsaces VI.), successor of his brother, Phraates I., came to the Parthian throne about 175 B.C. The first event of his reign was a war with Eucratides of Bactria, who tried to create a great Greek empire in the East. At last, when Eucratides had been murdered by his son about 150, Mithradates was able to occupy some districts on the border of Bactria and to conquer Arachosia (Kandahar); he is even said to have crossed the Indus (Justin 41, 6; Strabo xi. 515, 517; *cf.* Orosius v. 4, 16; Diod. 33, 18). Meanwhile the Seleucid kingdom was torn by internal dissensions, fostered by Roman intrigues. Phraates I. had already conquered eastern Media, about Rhagae (Rai), and subjected the Mardi on the border of the Caspian (Justin 41, 5; Isidor. *Charac.* 7). Mithradates I. conquered the rest of Media and advanced towards the Zagros chains and the Babylonian plain. In a war against the Elymaeans (in Susiana) he took the Greek town Seleucia on the Hedyphon, and forced their king to become a vassal of the Parthians (Justin 41, 6; Strabo xv. 744). About 141 he must have become master of Babylonia. By Diodorus 33, 18 he is praised as a mild ruler; and the fact that from 140 he takes on his coins the epithet *Philhellen* (W. Wroth, *Catalogue of the Coins of Parthia*, p. 14 *seq.;* till then he only calls himself "the great king Arsakes") shows that he tried to conciliate his Greek subjects. The Greeks, however, induced Demetrius II. Nicator to come to their deliverance, although he was much pressed in Syria by the pretender Diodotus Tryphon. At first he was victorious, but in 138 he was defeated. Mithradates settled him with a royal household in Hyrcania and gave him his daughter Rhodogune in marriage (Justin 36, 1, 38, 9; Jos. *Ant.* 13, 5, 11; Euseb. *Chron.* I. 257; Appian *Syr.* 67). Shortly afterwards Mithradates I. was succeeded by his son Phraates II., the real founder of the Arsacid Empire.

MITHRADATES II. the Great, king of Parthia (*c.* 120–88 B.C.), saved the kingdom from the Mongolian Sacae (Tochari), who had occupied Bactria and eastern Iran, and is said to have extended the limits of the empire (Justin 42, 2, where he is afterwards confused with Mithradates III.). He defeated King Artavasdes of Armenia and conquered seventy valleys; and the prince Tigranes came as hostage to the Parthians (Justin 42, 2; Strabo, xi. 532). In an inscription from Delos (Dittenberger, *Or. gr. inscr.* 430) he is called "the great King of Kings Arsakes." He also interfered in the wars of the dynasts of Syria (Jos. *Ant.* xiii. 14, 3). He was the first Parthian king who entered into negotiations with Rome, then represented by Sulla, praetor of Cilicia (92 B.C.).

MITHRADATES III. murdered his father Phraates III. about 57 B.C., with the assistance of his brother Orodes. He was made king of Media, and waged war against his brother, but was soon

deposed on account of his cruelty. He took refuge with Gabinius, the Roman proconsul of Syria. He advanced into Mesopotamia, but was beaten at Seleucia by Surenas, fled into Babylon, and after a long siege was taken prisoner and killed in 54 by Orodes I. (Dio Cass 39, 56; Justin 42, 4; Jos *Bell.* i. 8, 7 *Ant.* 14, 6, 4).

A Parthian king Mithradates, who must have occupied the throne for a short time during the reign of Phraates IV., is mentioned by Jos. *Ant.* xvi. 8, 4, in 10 B.C.; another pretender Meherdates was brought from Rome in A.D. 49 by the opponents of Gotarzes, but was defeated (Tac. *Ann.* xi. 10, xii. 10 *sqq.*). The name of another pretender Mithradates (often called Mithradates IV.) occurs on a coin of the first half of the 2nd century, written in Aramaic accompanied by the Arsacid titles in Greek (Wroth, *Catal. of the Coins of Parthia*, p. 219); he appears to be identical with Meherdotes, one of the rival kings of Parthia who fought against Trajan in 116; he died in an attack on Commagene and appointed his son Sanatruces successor, who fell in a battle against the Romans (Arrian *ap.* Malalas, *Chron.* pp. 270, 274) (ED. M.)

Kings of Pontus.—The kings of Pontus were descended from one of the seven Persian conspirators who put the false Smerdis to death. (*See* DARIUS I.) According to Diodorus Siculus, three members of his family—Mithradates, Ariobarzanes, Mithradates—were successively rulers of Cius on the Propontis and Carinē in Mysia. The last of these was put to death in 302 B.C. by Antigonus, who suspected him of having joined the coalition against him. He was succeeded by his son Mithradates I. or III. (if the two dynasts of Cius be included[1]), the founder κτίστης of the Pontic kingdom, although this distinction is by some attributed to the father. Warned by his friend Demetrius, the son of Antigonus, that he was threatened with the same fate as his father, he fled to Paphlagonia, where he seized Cimiata, a fort at the foot of the Olgassys range. Being joined by the Macedonian garrison and the neighbouring populations, he conquered the Cappadocian and Paphlagonian territories on both sides of the Halys and assumed the title of king. Before his death he further enlarged Pontic Cappadocia. He was succeeded by Ariobarzanes, who left the throne to MITHRADATES II. (*c.* 256–190, according to Meyer, *Mithradates II. and III.*), a mere child. Early in his reign the Gauls of Galatia invaded his territory. Mithradates was at the battle of Ancyra (*c.* 241), in which he assisted Antiochus Hierax against his brother Seleucus Callinicus, in spite of the fact that he had married the daughter of the latter with Greater Phrygia as her dowry. His two daughters, both named Laodice, were married, one to Antiochus the Great, the other to his cousin Achaeus, a dynast of Asia Minor. He unsuccessfully attacked Sinope, which was taken by his successor Pharnaces, the brother (not the son) of MITHRADATES III. (169–121), surnamed *Philopator, Philadelphus* and *Euergetes.* According to Meyer, however, there were two kings (Mithradates IV. *Philopator* and V. *Euergetes*). He was the first king of Pontus to recognize the suzerainty of the Romans, of whom he was a loyal ally. He assisted Attalus II. of Pergamum to resist Prusias II. of Bithynia; furnished a contingent during the Third Punic War; and aided the Romans in obtaining possession of Pergamum, bequeathed to them by Attalus III., but claimed by Aristonicus, a natural son of Eumenes II. Both Mithradates and Nicomedes of Bithynia demanded Greater Phrygia in return for their services. It was awarded to Mithradates, but the senate refused to ratify the bargain on the ground of bribery. For several years the kings of Pontus and Bithynia bid against each other, till in 116 Phrygia was declared independent, although in reality it was treated as part of the province of Asia. Mithradates appears to have taken it without waiting for the decision of the senate. He invaded Cappadocia, and married his daughter to the young king, Ariarathes Epiphanes; bought the succession from the last king of Paphlagonia, and obtained a kind of protectorate over Galatia. He was a great admirer of the Greeks, who called him Euergetes; he removed his capital from Amasia to Sinope, and bestowed liberal gifts upon the temples of Delos and Athens. At the height of his power he was assassinated by his courtiers during a banquet in his palace at Sinope.

[1]There is much difference of opinion in regard to the kings of Pontus called Mithradates to the accession of Mithradates Eupator. Ed. Meyer reckons five, T. Reinach three.

MITHRADATES VI. *Eupator,* called the Great, a boy of eleven, now succeeded his father. Alarmed at the attempts made upon his life by his mother, he fled to the mountains and was for many years a hunter. In 111 he returned to Sinope, threw his mother into prison, and put his younger brother to death. Having thus established himself on the throne, he turned his attention to conquest. In return for his assistance against the Scythians, the Greeks of the Cimmerian Bosporus and the Tauric Chersonese recognized his suzerainty. He occupied Colchis, Paphlagonia and part of Galatia; set his son Ariarathes on the throne of Cappadocia and drove out Nicomedes III., the young king of Bithynia. The Romans restored the legitimate kings, and, while apparently acquiescing, Mithradates made preparations for war. He had long hated the Romans, who had taken Phrygia during his minority, and he aimed at driving them from Asia Minor. The cause of rupture was the attack on Pontic territory by Nicomedes at the instigation of the Romans. Mithradates, unable to obtain satisfaction, declared war (88 B.C.). He rapidly overran Galatia, Phrygia and Asia, defeated the Roman armies, and ordered a general massacre of the Romans in Asia. He sent large armies into European Greece, and his generals occupied Athens. But Sulla in Greece and Fimbria in Asia defeated his armies in several battles; the Greek cities were disgusted by his severity, and in 84 he concluded peace, abandoning all his conquests, surrendering his fleet and paying a fine of 2,000 talents. During what is called the Second Mithradatic War, Murena invaded Pontus without any good reason in 83, but was defeated in 82. Hostilities were suspended, but disputes constantly occurred, and in 74 a general war broke out. Mithradates defeated Cotta, the Roman consul, at Chalcedon; but Lucullus worsted him, and drove him in 72 to take refuge in Armenia with his son-in-law Tigranes. After two great victories at Tigranocerta (69) and Artaxata (68), Lucullus was disconcerted by mutiny and the defeat of his lieutenant Fabius. (*See* LUCULLUS.) In 66 he was superseded by Pompey, who completely defeated both Mithradates and Tigranes. The former established himself in 64 at Panticapaeum, and was planning new campaigns against the Romans when his own troops revolted, and, after vainly trying to poison himself, he ordered a Gallic mercenary to kill him. So perished Rome's greatest enemy in Asia Minor. His body was sent to Pompey, who buried it in the royal sepulchre at Sinope.

Ancient authorities have invested Mithradates with a halo of romance. His courage, his bodily strength and size, his skill in the use of weapons, in riding, and in the chase, his speed of foot, his capacity for eating and drinking, his penetrating intellect and his mastery of 22 languages are celebrated to a degree which is almost incredible. With a surface gloss of Greek education, he united the subtlety, the superstition, and the obstinate endurance of an Oriental. He collected curiosities and works of art; he assembled Greek men of letters round him; he gave prizes to the greatest poets and the best eaters. He spent much of his time in practising magic and it was believed that he had so saturated his body with poisons that none could injure him. He trusted no one; he murdered his mother, his sons, the sister whom he had married; to prevent his harem from falling to his enemies he murdered his concubines, and his followers were never safe.

See T. Reinach, *Mithridate Eupator* (1890; Ger. trans. by A. Goetz, 1895, with the author's corrections and additions); also E. Meyer, *Geschichte des Königreichs Pontos* (1879).

MITHRAS (MITHRES, MITHRA), a god, mentioned in Sanskrit and Old Persian documents and thus probably older than the separation of the Iranian stock from the Aryan invaders of India. (*See* INDIA, *History;* PERSIA, *History.*)

History.—Although mentioned by Greek writers, particularly of Hellenistic date, as an important Persian deity, his history is obscure. In Zoroastrianism as we know it, he is simply a *Yazata,* a kind of angel, a power of light who fights on the side of Ahura-Mazda. This warlike characteristic he seems always to have retained. But other evidence exists to show that his position remained higher than this would indicate. Names compounded of his (*e.g.,* Mithradates) are common among Orientals of various epochs; his festival, the Mithrakana, (sixteenth day of the seventh month; both month and day were especially sacred to him) was

brilliant, and modified forms of it survived to Muslim times.

His cult naturally spread with the Persian conquests, and in particular, he reached the Euphrates valley, where he was so long settled that several Greek and Roman writers speak of him as an Assyrian god. Another branch of his cult, of some importance for later developments, was established in Cilicia; but for some reason he never penetrated to the western parts of Asia Minor till late times, about the beginning of the Christian era. Naturally, the concept of him was modified by contact with foreign cults, and in particular, he tended to be identified, or at least brought into close association with, the Sun. Perhaps as a result of the accretion of foreign worshippers, his cult took on, if it did not already possess, the form of a mystery, with more or less definite grades of initiation and ceremonials of purification, penance and so forth, appropriate to such a worship.

Mithraism was first transmitted to the Roman world during the 1st century B.C. by the Cilician pirates captured by Pompey. As late as the time of Augustus it was but little known in Roman territory, and gained a firm foothold in Italy only gradually, as a result of Rome's increasing hold upon Asia.

Towards the close of the 2nd century the cult had begun to spread rapidly through the army, the mercantile class, slaves and actual propagandists, all of which classes were largely composed of Asiatics. It throve, especially among military posts, and in the track of trade, notably at ports. The German frontiers afford most evidence of its prosperity. Rome itself was a favourite seat of the religion. From the end of the 2nd century the emperors encouraged Mithraism, because of the support which it afforded to the divine right of monarchs. The Persian belief that the legitimate sovereign reigned by the grace of Ormazd, whose favour was made manifest by the sending of the *Hvarenō*, a kind of celestial aureole of fire, resulted in the doctrine that the sun was the giver of the *Hvarenō*. Mithras, identified with Sol Invictus, thus became the giver of authority and victory to the imperial house.

The beginning of the downfall of Mithraism dates from A.D. 275, when Dacia was lost to the empire. The aggression of Christianity also was now more effective. The emperors, however, favoured the cult, which was the army's favourite until Constantine destroyed its hopes. The reign of Julian and the usurpation of Eugenius renewed the hopes of its devotees, but the victory of Theodosius (394) may be considered the end of its existence. It still survived in certain cantons of the Alps in the 5th century, and clung to life with more tenacity in its Eastern home.

Sources, Remains, Ritual.—The sources of present knowledge regarding Mithraism consist of the Vedas, the Avesta, the Pahlevi writings, Greek and Latin literature and inscriptions, and the cult monuments. The last include (a) some hundreds of sculptures, (b) numerous chapels, which are grottoes (*spelaea*) underground, or imitations thereof in masonry. The average grotto held from fifty to a hundred persons. The size of the sanctuaries, however, was compensated for by their number.

The typical bas relief, which is found in great abundance in the museums of Europe, invariably represents Mithras, under the form of a youth with conical cap and flying drapery, slaying the sacred bull, the scorpion attacking the genitals of the animal, the serpent drinking its blood, the dog springing towards the wound in its side, and frequently, in addition, the Sun-god, his messenger the raven, a fig-tree, a lion, a ewer, and torch-bearers. The relief is in some instances enclosed in a frame of figures and scenes in relief. The smaller reliefs Cumont arranges in two groups; (1) Infinite Time (*Zrvan Akarana*) called in Greek κρόνος, identified by theorists of that day with χρόνος; in Latin, Saturnus; Tellus and Atlas supporting the globe, representing the union of Earth and Heaven; Oceanus; the Fates; Infinite Time giving into the hand of his cessor Ormazd the thunderbolt, the symbol of authority; Ormazd struggling with a giant of evil—the Mithraic gigantomachy. (2) The birth of Mithras; then the god nude, cutting fruit and leaves from a fig-tree in which is the bust of a deity, and before which one of the winds is blowing upon Mithras; the god discharging an arrow against a rock from which springs a fountain; the bull in a small boat, near which again occurs the figure of the animal under a roof about to be set on fire by two figures; the bull in flight, with Mithras in pursuit; Mithras bearing the bull on his shoulders; Helios kneeling before Mithras; Helios and Mithras clasping hands over an altar; Mithras with drawn bow on a running horse; Mithras and Helios banqueting; Mithras and Helios mounting the chariot of the latter and riding over the ocean.

These documents Cumont interprets tentatively as follows. The head of the divine hierarchy of Mithras was Infinite Time; Heaven and Earth were his offspring, and begat Ocean. From Heaven and Earth sprang the remaining members of a circle analogous to the Olympic gods. Ahriman was also the son of Time. Mithras was the most important member of the circle, the mediator between man and the supreme god.

The Mithras legend has been lost, and can be reconstructed only from the sculptures. Mithras was born of a rock, the marvel being seen only by certain shepherds, who brought gifts and adored him. Chilled by the wind, the new-born god went to a fig-tree, partook of its fruit, and clothed himself in its leaves. He then undertook to vanquish the beings already in the world, and rendered subject to him first the Sun, with whom he concluded a treaty of friendship. Next, he captured the sacred bull which had been created by Ormazd. This by order of the Sun, who sent his messenger the raven, he reluctantly sacrificed. From the dying animal sprang the life of the earth, although Ahriman sent his emissaries to prevent it. The soul of the bull rose to the celestial spheres and became the guardian of herds and flocks under the name of Silvanus. Mithras was through his deed the creator of life. Meanwhile Ahriman sent a terrible drought upon the land. Mithras defeated his purpose by discharging an arrow against a rock and miraculously drawing the water from it. Next Ahriman sent a deluge, from which one man escaped in a boat with his cattle. Finally a fire desolated the earth, and only the creatures of Ormazd escaped. Mithras, his work accomplished, banqueted with the Sun for the last time, and was taken by him in his chariot to the habitation of the immortals, whence he continued to protect the faithful.

As regards the organization of Mithraism, S. Jerome (*Epist.* 107, 2) and inscriptions preserve the knowledge that the mystic, *sacratus*, passed through seven degrees, which probably corresponded to the seven planetary spheres traversed by the soul in its ascent; *Corax*, Raven; *Cryphius*, Hidden (κρύφιος) (cryphus, the mss. corrected by Hilberg from inscr.; the initiate was perhaps veiled). *Miles*, Soldier, signifying the holy warfare against evil in the service of the god; *Leo*, Lion, symbolic of the element of fire; *Perses*, Persian (*cf.* the Christian use of "Israel," "Zion," etc.) *Heliodromus*, Courier of the Sun; *Pater*, Father, a degree bringing the mystic among those who had the general direction of the cult for the rest of their lives.

Of the seven degrees, those mystics not yet beyond the third, *Miles*, were not in full communion, and were called ὑπηρετοῦντες (servants); while the fourth degree, *Leo*, admitted them into the class of the fully initiate, the μετέχοντες (participants). No women were connected with the cult. A sacred communion of bread, water and possibly wine, compared by the Christian apologists to the Eucharist, was administered to the mystic who was entering upon one of the advanced degrees.

The Mithraic priest, *sacerdos* or *antistes*, was sometimes also of the degree of *pater*. Tertullian (*De praescr. haeret.* 40) calls the chief priest *summus pontifex*, probably the *pater patrum* who had general supervision of all the initiates in one city, and states that he could marry but once. According to the same author, there were Mithraic, as well as Christian, *virgines et continentes.* Each day of the week was marked by the adoration of a special planet, the sun being the most sacred of all.

The Mithraic community of worshippers, besides being a spiritual fraternity, was a legal corporation enjoying the right of holding property, with temporal officials at its head, like any other *sodalitas*. The cult was supported mainly by voluntary contribution. An abundance of epigraphic evidence testifies to the devotion of rich and poor alike.

Moral Influence.—Like all the mystery religions (*see* MYSTERY) of that day, Mithraism attracted neophytes by claiming to

possess ancient and divine wisdom and by holding out hopes of a blessed immortality in union with a god. But it would seem, in addition, to have had a high moral standard. The "soldier" of Mithras, like the "soldier" of Christ, was a warrior on the side of good against evil. While observing ritual, he had also to be morally pure and upright. Those who were so, might hope to regain, by successive degrees (corresponding according to the popular astrological doctrine, to the seven planets), the original beatitude of the soul; the wicked fell to the portion of Ahriman.

Relation to Christianity.—The most interesting aspect of Mithraism is its antagonism to Christianity. Both religions were of Oriental origin; they were propagated about the same time, and spread with equal rapidity on account of the same causes, viz., the unity of the political world and the debasement of its moral life. The points of collision were especially at Rome, in Africa, and in the Rhône Valley, and the struggle was the more obstinate because of the resemblances between the two religions, which were so numerous and so close as to be noticeable as early as the 2nd century, causing mutual recrimination.

The fraternal spirit of the first communities, and their humble origin; the connection of their central figures with the Sun; the legends of the shepherds with their gifts and adoration; the flood, and the ark; the representation in art of the fiery chariot; the drawing of water from the rock; the use of bell and candle, holy water and the communion; the sanctification of Sunday and of the 25th of December; the insistence on moral conduct, the emphasis placed upon abstinence and self-control; the doctrine of heaven and hell, of primitive revelation, of the mediation of the Logos emanating from the divine, the atoning sacrifice, the constant warfare between good and evil and the final triumph of the former, the immortality of the soul, the last judgment, the resurrection of the flesh and the fiery destruction of the universe—are some of the resemblances which, whether real or only apparent, enabled Mithraism to prolong its resistance to Christianity. At their root lay a common Eastern origin rather than any borrowing.

Neither these resemblances, many of which can be found in all the mystery cults, nor the approach made by Mithraism to becoming a universal religion, should be exaggerated. As regards the latter, it could never have been really universal, for it apparently quite excluded women; also, it was a compromise with polytheism, and, as such, weaker than its uncompromising rival. Moreover, like all the other mystery-cults, it had as its central figure a mythical, not a historical personage. Many elements of it passed into Manichaeism, which seems to have provided a half-way house for those who were not prepared to accept the Christian theology in its entirety.

MITOSIS, a process of nuclear division. *See* CYTOLOGY.

MITRA, RAJENDRA LALA (1824–1891), Indian Orientalist, was born in a suburb of Calcutta on Feb. 15, 1824, of a respectable family of the Kayasth or writer caste of Bengal. In 1846 he was appointed librarian of the Asiatic Society, and to that society the remainder of his life was devoted—as philological secretary, as vice-president, and as the first Indian president in 1885 Apart from very numerous contributions to the society's journal, and to the series of Sanskrit texts entitled "Bibliotheca indica," he published three separate works: (1) *The Antiquities of Orissa* (2 vols., 1875 and 1880), illustrated with photographic plates, in which he traced back the image of Jagannath (Juggernaut) and also the car-festival to a Buddhistic origin; (2) a similarly illustrated work on *Bodh Gaya* (1878), the hermitage of Sakya Muni, and (3) *Indo-Aryans* (2 vols., 1881), a collection of essays dealing with the manners and customs of the people of India from Vedic times. He received the honorary degree of LL.D. from the University of Calcutta in 1875, the companionship of the Indian Empire when that order was founded in 1878, and the title of raja in 1888. He died at Calcutta on July 26, 1891.

MITRE, BARTOLOMÉ (1821–1906), Argentine statesman, soldier, author, journalist and president of the republic, was born in Buenos Aires on July 26, 1821, the son of an Argentine army officer. While still a youth his political views caused him to seek refuge in Montevideo, and he spent the next 15 years in exile, serving in the sieges of Montevideo in 1838 and 1843–46 as captain and lieutenant-colonel, commanding the government artillery in Bolivia, 1847–48, and editing *El Mercurio* in Valparaiso, Chile, 1848–49, until his opposition to the government compelled him to leave that country. In 1852 he returned to Argentina and commanded the Uruguayan artillery in the battle of Monte Caseros (Feb. 3, 1852) where Gen. Urquiza overthrew the dictator Rosas. Elected deputy to the provincial legislature of Buenos Aires, he led the opposition to Urquiza's Federal plan of Government, was appointed provincial minister of war in 1853 and in 1860 governor of the province. In 1859 the estrangement between Buenos Aires and the Confederation resulted in war. Mitre, commanding the provincial forces, was beaten in the battle of Cépeda (Oct. 22, 1859) and Buenos Aires was incorporated into the confederation, but in 1861 he defeated Urquiza in the battle of Pavón (Sept. 17), definitively establishing the hegemony of Buenos Aires; and after a short period as president *ad interim*, he became constitutional president on Oct 7, 1862. Under his leadership Argentina made great progress. He impressed the authority of the national government upon the provincial *caudillos*, reorganized the finances, improved international relations and fostered public works, means of communication, immigration and industries. When, in 1865, Argentina joined Brazil and Uruguay in the War of the Triple Alliance against Paraguay (1865–70), Mitre, now a general, was for a time in command of the allied troops. Soon after the conclusion of his presidential term in 1868, he was elected to the senate, and in 1872–73 filled a special diplomatic mission to Brazil and Paraguay. A candidate for the presidency in 1874, upon his defeat he headed an unsuccessful revolt, but he continued to have great political influence and in 1891 was a third time candidate for the presidency; he withdrew his name, however, and not long afterwards retired from political life. He died in Buenos Aires on Jan. 18, 1906.

Mitre's activities were never restricted to those of soldier and statesman. Aside from his journalistic career, which included the ownership of *La Nación*, one of the most important newspapers in Spanish-America, his contributions to philology and history proved him one of the outstanding intellectual men of the continent. His works include: *Rimas* (Paris, 1854); *Historia de Belgrano* (Buenos Aires, 1887); *Historia de San Martin* (Buenos Aires, 1890); *Lenguas americanas* (La Plata, 1894). His private library, at the time the finest in Spanish-America, he presented as a gift to the State.

See J. Victorica, *Urquiza y Mitre* (B.A., 1906); *Enciclopedia Universal Ilustrada* (Barcelona, 1917?); R. Bazán de Cámara, *Estudio sobre la personalidad del general Mitre* (B.A., 1921); R. Rivarola, *Mitre . . . 1852–62* (B.A., 1921); R. Rojas, *Bartolomé Mitre* (Inter-America, Eng. ed. Dec. 1921, Feb. 1922). (W. B. P.)

MITRE, a liturgical head-dress of the historic churches, generally proper to bishops. The word is derived through the Latin from the Greek μίτρα, a head-band or head-dress.

In the Roman Catholic Church its actual form is that of a sort of folding cap consisting of two halves which, when not worn, lie flat upon each other. These sides are stiffened, and when the mitre is worn, they rise in front and behind like two horns pointed at the tips. From the lower rim of the mitre at the back hang two bands (*infulae*), terminating in fringes. In the Roman Catholic Church mitres are divided into three classes: (1) *Mitra pretiosa,* decorated with jewels, gold plates, etc.; (2) *Mitra auriphrygiata,* of white silk, sometimes embroidered with gold and silver thread or small pearls, or of cloth of gold plain; (3) *Mitra simplex,* of white silk damask, silk or linen, with the two falling bands behind terminating in red fringes. Mitres are the distinctive head-dress of bishops; but the right to wear them, as in the case of the other episcopal insignia, is granted by the popes to other dignitaries. Bishops alone, including of course the pope and his cardinals, are entitled to wear the *pretiosa* and *auriphrygiata;* the others wear the *mitra simplex.*

Origin and Antiquity.—The origin and antiquity of the episcopal mitre have been the subject of much debate. Some have

claimed for it apostolical sanction and found its origin in the liturgical head-gear of the Jewish priesthood. Such proofs as have been adduced for this view are, however, based on reading a special meaning into words (*mitra, infula,* etc.) used by early writers. With the episcopal mitre the Jewish *miznephet,* translated "mitre" in the King James Version (Exod. xxviii. 4,36), has nothing to do, and there is no evidence for the use of the former before the middle of the 10th century even in Rome, while elsewhere it does not make its appearance until the 11th.

The first trustworthy notice of its use is under Pope Leo IX. (1049–54). This pope invested Archbishop Eberhard of Trier, who had accompanied him to Rome, with the Roman *mitra,* telling him that he and his successors should wear it *in ecclesiastico officio* (*i.e.,* as a liturgical ornament) according to Roman custom, in order to remind him that he is a disciple of the Roman see (Jaffé, *Regesta pont. rom.,* ed. Leipzig, 1888, No. 4158).

From Leo IX.'s time papal grants of the mitre to eminent prelates became increasingly frequent, and by the 12th century it had been assumed by all bishops in the west, with or without papal sanction, as their proper liturgical head-dress. From the 12th century, too, dates the custom of investing the bishop with the mitre at his consecration.

It was not till the 12th century that the mitre came to be regarded as specifically episcopal, and meanwhile the custom had grown up of granting it *honoris causa* to other dignitaries besides bishops. (*See* ABBOT.)

Mitres were also sometimes bestowed by the popes on secular sovereigns. In the coronation of the emperor, more particularly, the mitre played a part. According to the 14th Roman *ordo,* of 1241, the pope places on the emperor's head first the *mitra clericalis,* then the imperial diadem.

Development of Form.—The original form of the mitre was that of the early papal tiara (*regnum*), *i.e.,* a somewhat high conical cap. The stages of its general development from this shape to the high double-horned modern mitre are clearly traceable though it is impossible exactly to distinguish them in point of date. The most characteristic modifications may be said to have taken place from the 11th to the middle of the 13th century. About 1100 the conical mitre begins to give place to a round one; a band of embroidery is next set over the top from back to front, which tends to bulge up the soft material on either side; and these bulges develop into points or horns. Mitres with horns on either side seem to have been worn till the end of the 12th century. The custom was, however, already growing up of setting horns over the front and back of the head instead of the sides, and with this the essential character of the mitre during the middle ages, was established.

In most of the reformed churches the use of mitres was abandoned with that of the other vestments. They have continued to be worn, however, by the bishops of the Scandinavian Lutheran churches. In the Church of England the liturgical use of the mitre was discontinued at the Reformation, but was revived in the latter part of the 19th century, and is now fairly widespread.

In the Orthodox Eastern Church the mitre is proper only to bishops. Its form differs entirely from that of the Latin Church. In general it rather resembles a closed crown, surmounted by a cross. In Russia the cross usually lies flat, only certain metropolitans, and by prescription the bishops of the eparchy of Kiev, having the right to have the cross upright. In the Armenian Church priests and archdeacons, as well as the bishops, wear a mitre. That of the bishops is of the Latin form, a custom dating from a grant of Pope Innocent III.; that of the priests, the *sagvahart,* is not unlike the Greek mitre. In the Syrian Church only the patriarch wears a mitre, which resembles that of the Greeks. The *biruna* of the Chaldaean Nestorians, on the other hand, worn by all bishops, is a sort of hood ornamented with a cross. Coptic priests and bishops wear the *ballin,* a long strip of stuff ornamented with crosses, etc., and wound turban-wise round the head; the patriarch of Alexandria has a helmet-like mitre, the origin of which is unknown, though it perhaps antedates the appearance of the *phrygium* at Rome. The Maronites, and the uniate Jacobites, Chaldaeans and Copts have adopted the Roman mitre.

The mitre was introduced into the Greek rite only after the capture of Constantinople by the Turks (1453).

See J. Braun, S.J., *Die liturgische Gewandung,* pp. 424–498 (1907). The question of the use of the mitre in the Anglican Church is dealt with in the *Report of the Sub-committee of the Convocation of Canterbury on the Ornaments of the Church and its Ministers* (1908). *See* also the bibliography to the article VESTMENTS.

MITROVICA, a town of Croatia Slavonia, Yugoslavia. Pop. (1921) 11,848. It is a flourishing river port, and one of the principal markets of Croatia Slavonia for pigs and sheep, for which three fairs are held annually. Cattle and horses are also reared. Mitrovica occupies the site of Sirmium, the chief city of Lower Pannonia, and many Roman remains have been discovered. The emperor Probus (232–282) was born and buried at Sirmium, where according to some authorities the emperor Marcus Aurelius (121–180) also died. It became an episcopal see about 305, and was united with the diocese of Bosnia in 1773. The city was sacked by the Huns in 441, and by the Turks, who destroyed all its ancient buildings, in 1396 and 1521.

MITSCHERLICH, EILHARDT (1794–1863), German chemist, was born on Jan. 7, 1794 at Neuende near Jever, Oldenburg, where his father was pastor. He was educated at Jever and went to Heidelberg in 1811; he devoted himself to philology, and gave special attention to the Persian language. Mitscherlich resolved to study medicine in order that he might enjoy that freedom of travel usually allowed in the East to physicians. He began at Göttingen with the study of chemistry, and this so arrested his attention that he gave up the idea of a journey to Persia. From his Göttingen days dates the treatise on certain parts of Persian history, compiled from mss. in the university library and published in Persian and Latin in 1814, under the title *Mirchondi historia Thaheridarum historicis nostris huiusque incognitorum Persiae principum.* In 1818 he went to Berlin and worked in the laboratory of H. F. Link (1767–1851). There he made analyses of phosphates and phosphites, arsenates and arsenites, confirming the conclusions of J. J. Berzelius as to their composition; bis observation that corresponding phosphates and arsenates crystallize in the same form was the germ from which grew the important theory of isomorphism which he communicated to the Berlin academy in Dec. 1819. Shortly afterwards he went to Stockholm and studied under Berzelius; he returned to Berlin in 1821, and in the summer of 1822 he delivered his first lecture as extraordinary professor of chemistry in the university, where in 1825 he was appointed ordinary professor. He died at Schönberg, near Berlin, on Aug. 28, 1863.

In the course of Mitscherlich's crystallographic investigations he observed that the rhombohedral angles in the case of calcspar varied with the temperature, and that crystals, when heated expand unequally in the direction of dissimilar axes. His investigation (also in 1826) of the two crystalline modifications of sulphur brought to light the fact that certain substances could exist in different crystalline forms, a property which Mitscherlich called dimorphism. He obtained selenic acid in 1827 and showed that its salts are isomorphous with the sulphates, while a few years later he proved that the same thing is true of the manganates and the sulphates, and of the permanganates and the perchlorates. He prepared benzene sulphonic acid (1833), nitrobenzene (1834) and investigated the relation of benzene to benzoic acid and to other derivatives (1835). In 1829–30 he published his *Lehrbuch der Chemie,* which embodied many original observations. His interest in mineralogy led him to study the geology of volcanic regions, and he tried to devise a theory of volcanic action. He did not, however, publish any papers on the subject, though after his death his notes were arranged and published by Dr. J. L. A. Roth in the *Memoirs* of the Berlin Academy (1866).

Mitscherlich's published papers are chiefly to be found in the *Abhandlungen* of the Berlin academy; in the *Annalen der Physik und Chemie* (ed. J. C. Puggendorf, Halle, 1790, etc.); and in the *Annales de chimie et de physique* (1816, etc.). The 4th edition of the *Lehrbuch der Chemie* was published in 1844–47, a 5th was begun in 1855 but was not completed. His *Gesammelte Schriften* were edited by A. Mitscherlich in 1896, who also published *Erinnerung von Eilhardt Mitscherlich* (1894). *See* also A. D. von Hofmann, *Chemische Erinnerungen* (1882).

MITTAG-LEFFLER, MAGNUS GÖSTA (1846–1927), Swedish mathematician, was born at Stockholm on March 16, 1846. He studied at Uppsala and later became lecturer at the University of Uppsala (1872–77), professor at Helsingfors (1877–81), and finally professor at Stockholm, being rector of the University in 1886, 1891 and in 1893. Mittag-Leffler found the *Acta Mathematica* in 1883, set up an editorial staff from the four Scandinavian countries, gained the patronage of Oscar II. of Sweden, and acted as chief editor for 45 years. This journal was international. As a mathematician, Mittag-Leffler made a number of contributions to analysis. He worked on the general theory of functions and gave a proof of Cauchy's theorem. He also dealt with the problem of the analytic representation of a one-valued function; in connection with this there is the well known Mittag-Leffler theorem. A good deal of his researches laid the foundation of later work by other mathematicians. Mittag-Leffler was the recipient of numerous honours both at home and abroad and was an honorary member of many societies. He died at Stockholm on July 7, 1927.

See notice by Nörlund in *Acta Mathematica.*

MITTWEIDA, a town of Germany in the republic of Saxony, on the Zschopau, 12 m. by rail N. of Chemnitz on the railway to Döbeln and Riesa. Pop. (1925) 19,278. It has cotton spinning and weaving mills. Other industries are the making of furniture, machinery, cigars and leather.

MIVART, ST. GEORGE JACKSON (1827–1900), English biologist, was born on Nov. 30, 1827, in London. In 1851 he was called to the bar, but devoting himself to scientific studies, he was appointed lecturer at St. Mary's Hospital medical school in 1862, and from 1874 to 1877 was professor of biology at the short-lived Catholic University College, London. In 1871 his *Genesis of Species* brought him into the controversy then raging round the theories of Darwin, and ultimately led to his estrangement from both Darwin and Huxley. Though admitting evolution in general, Mivart emphasized the distinction between organic and inorganic matter, minimized the importance of natural selection, and, especially in his *Nature and Thought* (1882) and his *Origin of Human Reason* (1889), denied the evolution of the human intellect. Some articles published in the *Nineteenth Century,* while he was professor of the philosophy of natural history at Louvain, advocated the claims of science even where they seemed to conflict with religion, and were placed on the *Index.* Other articles in January 1900 led to his excommunication by Cardinal Vaughan, with whom he had a curious correspondence vindicating his claim to hold liberal opinions while remaining a Catholic. Shortly afterwards he died, in London, on April 1, 1900.

Besides the above named works, Mivart wrote: *Lessons in Elementary Anatomy* (1873), *Man and Apes* (1873), *The Common Frog* (1874) and *The Cat: an Introduction to the Study of Back-boned Animals* (1881)—all of which exhibit his scientific powers. A complete list of his publications is in the *Dict. Nat. Biog.*

MIXE-ZOQUE, a stock of Mexican Indians, in the region of the Isthmus of Tehuantepec, between long. 92° and 96°, nowhere reaching the sea. The Mixe are to the west, the Zoque to the east. The two languages are related, but seem distinct from Zapotecan, Nahuan and Maya. Mixe and Zoque were regarded as sturdy but backward people by their ancient neighbors. The Popoloco of Puebla and Tapachula of the Guatamalan frontier seem to belong to them linguistically. The 1895 census enumerated 28,000 Mixe and 12,000 Zoque.

MIXTEC, a people occupying much of the western half of the State of Oaxaca, Mexico. With the Zapotec and several smaller groups, they are considered to form the Zapotecan linguistic family. They participated to some degree in the higher civilization of ancient Mexico, and made fine polychrome pottery. They were conquered by the Aztecs. In 1895, 146,000 Indians spoke Mixtec.

MIXTURES, PROPERTIES OF: *see* CHEMISTRY.

MIZPAH. There are several places of this name in the Old Testament. (1) Mizpah of Gilead, where Jacob was reconciled to Laban, and Jepthah encamped before attacking the Ammonites. It is supposed to be identical with Ramoth Gilead. (2) Mizpah of Benjamin, where the Hebrews assembled preliminary to the annihilation of the Benjamites (Judges xx., 1); Samuel made it his headquarters (1 Sam. vii., 5). Fortified by Asa it became the seat of the viceroy Gedaliah and the scene of his murder. Although recently an identification with Tell-en-Nasbeh has been suggested, Nebi Samwil is the traditional and generally accepted site. A crusaders' church (1151), later converted into a mosque, is built over the traditional tomb of Samuel. It was destroyed by the shelling of the Turkish army in their efforts to drive from it the British troops (Nov. 27–30, 1917). (3) A territory near Mt. Hermon (Josh. xi., 3). (4) A town in the tribe of Judah (Josh. xv., 38). (5) Mizpah of Moab, where David interviewed the king of Moab and found a place of refuge for his parents (1 Sam. xxii., 3).

See W. J. Phythian-Adams, "The Mizpah of 1 Sam. vii., 5"; *Journ. Pal. Orient. Soc.* 3 (1923) 13 *seq.* (=Tell-en-Nasbeh); W. F. Albright. "The Site of Mizpah in Benjamin": *Revue Biblique* 33 (1924) 637 *seq.* (Nebi Samwil).

MIZRAIM, the biblical name for Egypt (Gen. x. 6, 13). The apparently dual termination (Heb. *Miṣrayim*) may be due to a misunderstanding or may refer to Upper and Lower Egypt as two entities in one. There is an alternative poetical form Māṣōr (2 Ki. xix. 24, etc.). In Isa. xi. 11 the name is distinct from Pathros or Upper Egypt, and includes some of Lower Egypt.

But C. T. Beke, as long ago as 1834, in his *Origines biblicae* concluded that "Egypt" in the Old Testament sometimes denotes a district near Midian and the Gulf of 'Akaba; and this view restated quite independently by Hugo Winckler on later evidence (1893) has been the subject of continued debate. Egypt is known to have laid claim to the southern half of Palestine from early times, and consequently the extension of the name of Egypt beyond the limits of Egypt is inherently probable (so especially Ezek. xx. 36). For example, Hagar, as the ancestress of Ishmaelite tribes, may not have been an "Egyptian" in the strict ethnical sense. Besides this Mizraim the Old Testament knows of another. In 1874 E. Schrader pointed out that the Assyrians locate a Muṣri (*i.e.,* Mizraim) to the north of Palestine and this land presumably is referred to in 2 Ki. vii. 6 (mentioned with the Hittites), and again in 1 Ki. x. 28 *seq.,* 2 Chron. i. 16 *seq.,* where the word for "droves" (Heb. *m-ḳ-v-h*) conceals the land of Kuë (Cilicia). The situation of this Muṣri is disputed, some authorities even placing it east of the Tigris.

MLADÁ BOLESLAV, a beautiful old town in Bohemia, Czechoslovakia, on the Jizera, a right-bank tributary of the Elbe, dating from the 10th century. Its old walls and towers harmonize with a picturesque setting but nevertheless the town is a brisk centre of trade and an important railway junction with sugar refineries and soap and candle factories. It has many fine old ecclesiastical buildings, some of them with a history closely associated with the Bohemian Brethren for whom the town was the metropolis; the tomb of Johann August, the celebrated bishop of their Order is in the Church of St. Maria. Pop. (1921) 17,237.

MNEMONICS, the general name applied to devices for aiding the memory. Such devices are also described as *memoria technica.* The principle is to enable the mind to reproduce a relatively unfamiliar idea, and specially a series of dissociated ideas, by connecting it, or them, in some artificial whole, the parts of which are mutually suggestive. Among the most famous examples of metrical mnemonics are the "gender rhymes" of the Latin grammars, the hexameter lines (especially that beginning "Barbara Celarent") invented by logicians (for a list *see* Baldwin's *Dict. of Philos.,* vol. ii., s.v. "Mnemonic Verses"), the verse for remembering the number of days in the months ("Thirty days hath September, April, June and November"). Other devices are numerous.

Systems.—Mnemonic devices were much cultivated by Greek sophists and philosophers, and are repeatedly referred to by Plato and Aristotle. In later times the invention was ascribed to the poet Simonides, perhaps for no other reason than that the strength of his memory was famous. Cicero, who attaches considerable importance to the art, but more to the principle of order as the best help to memory, speaks of Carneades (or perhaps Char-

mades) of Athens and Metrodorus of Scepsis as distinguished examples of the use of well-ordered images to aid the memory. The Romans valued such helps as giving facility in public speaking. The method used is described by the author of *Rhet. ad Heren.*, iii. 16–24; *see* also Quintilian (*Inst. Or.* xi. 2), whose account is, however, obscure. In his time the art had almost ceased to be practised. The Greek and Roman system of mnemonics was founded on the use of mental places and signs or pictures, known as "topical" mnemonics. The most usual method was to choose a large house, of which the apartments, walls, windows, statues, furniture, etc., were severally associated with certain names, phrases, events or ideas, by means of symbolic pictures; and to recall these it was only necessary to search over the apartments of the house till the particular place was discovered where they had been deposited by the imagination. In accordance with this system, if it were desired to fix an historic date in the memory, it was localized in an imaginary town divided into a certain number of districts, each with ten houses, each house with ten rooms, and each room with a hundred quadrates or memory-places, partly on the floor, partly on the four walls, partly on the roof. Thus, if it were desired to fix in the memory the date of the invention of printing (1436), an imaginary book, or some other symbol of printing, would be placed in the thirty-sixth quadrate or memory-place of the fourth room of the first house of the historic district of the town. Except that the rules of mnemonics are referred to by Martianus Capella, nothing further is known regarding the practice of the art until the 13th century. Among the voluminous writings of Roger Bacon is a tractate *De arte memorativa.* Raimon Lull devoted special attention to mnemonics in connection with his *ars generalis.* The first important modification of the method of the Romans was that invented by the German poet Konrad Celtes, who, in his *Epitoma in utramque Ciceronis rhetoricam cum arte memorativa nova* (1492), instead of places made use of the letters of the alphabet. About the end of the 15th century Petrus de Ravenna (b. 1448) awakened such astonishment in Italy by his mnemonic feats that he was believed by many to be a necromancer. His *Phoenix artis memoriae* (Venice, 1491, 4 vols.) went through as many as nine editions, the seventh appearing at Cologne in 1608. An impression equally great was produced about the end of the 16th century by Lambert Schenkel (*Gazophylacium,* 1610), who taught mnemonics in France, Italy and Germany, and, although he was denounced as a sorcerer by the university of Louvain, published in 1593 his tractate *De memoria* at Douai with the sanction of that celebrated theological faculty. The most complete account of his system is given in two works by his pupil Martin Sommer, published at Venice in 1619. In 1618 John Willis (d. 1628?) published *Mnemonica; sive ars reminiscendi* (Eng. version by Leonard Sowersby, 1661; extracts in Feinaigle's *New Art of Memory,* 3rd ed., 1813), containing a clear statement of the principles of topical or local mnemonics. Giordano Bruno, in connection with his exposition of the *ars generalis* of Lull, included a *memoria technica* in his treatise *De umbris idearum.* Other writers of this period are the Florentine Publicius (1482); Johann Romberch (1533); Hieronimo Morafiot, *Ars memoriae* (1602); B. Porta, *Ars reminiscendi* (1602).

In 1648 Stanislaus Mink von Wenussheim or Winckelmann made known what he called the "most fertile secret" in mnemonics —namely, the use of consonants for figures, so as to express numbers by words (vowels being added as required); and the philosopher Leibnitz adopted an alphabet very similar to that of Winckelmann in connection with his scheme for a form of writing common to all languages. Winckelmann's method, which in fact is adopted with slight changes by the majority of subsequent "original" systems, was modified and supplemented in regard to many details by Richard Grey (1694–1771), who published a *Memoria technica* in 1730. The principal part of Grey's method (which may be compared with the Jewish system by which letters also stand for numerals, and therefore words for dates) is briefly this: "To remember anything in history, chronology, geography, etc., a word is formed, the beginning whereof, being the first syllable or syllables of the thing sought, does, by frequent repetition, of course draw after it the latter part, which is so contrived as to give the answer. Thus, in history, the Deluge happened in the year before Christ two thousand three hundred forty-eight; this is signified by the word Del-*etok,* Del standing for Deluge and *etok* for 2348." To assist in retaining the mnemonical words in the memory they were formed into memorial lines, which, however, being composed of strange words in difficult hexameter scansion, are by no means easy to memorize. The vowel or consonant, which Grey connected with a particular figure, was chosen arbitrarily; but in 1806 Gregor von Feinaigle, a German monk from Salem near Constance, began in Paris to expound a system of mnemonics, one feature (based on Winckelmann's system) of which was to represent the numerical figures by letters chosen on account of some similarity to the figure to be represented or some accidental connection with it. This alphabet was supplemented by a complicated system of localities and signs. Feinaigle, who apparently published nothing himself, came to England in 1811, and in the following year one of his pupils published *The New Art of Memory,* which, beside giving Feinaigle's system, contains valuable historical material about previous systems. A simplified form of Feinaigle's method was published by Aimé Paris (*Principes et applications diverses de la mnémonique,* 7th ed., Paris, 1834), and the use of symbolic pictures was revived in connection with the latter by a Pole, Antoni Jaźwiński, of whose system an account was published by the Polish general J. Bem, under the title *Exposé général de la méthode mnémonique polonaise, perfectionnée à Paris* (Paris, 1839). Various other modifications of the systems of Feinaigle and Aimé Paris were advocated by subsequent mnemonists, among them being the *Phrenotypics* of Major Beniowsky, a Polish refugee, the *Phreno-Mnemotechny* (1845) of François Fauvel Gouraud, the *Mnemotechnik* of Karl Otto Reventlow (generally known as Karl Otto), a Dane, and the *Mnemotechny* of the American Pliny Miles.

The more complicated mnemonic systems have fallen almost into complete disuse; but methods founded chiefly on the so-called laws of association (*see* Association of Ideas) have been taught with some success in Germany by, among others, Hermann Kothe, author of *Lehrbuch der Mnemonik* (2nd ed., Hamburg, 1852), and *Katechismus der Gedächtnisskunst* (6th ed. by Montag, Leipzig, 1887); and Hugo Weber-Rumpe, author of *Mnemonische Zahlwörterbuch* (Breslau, 1885) and *Mnemonische Unterrichtsbriefe* (1887–1888); in England by Dr. Edward Pick, whose *Memory and the Rational Means of Improving it* (5th ed., 1873) and *Lectures on Memory Culture* (1899) obtained a wide circulation. Passing over the work of William Day (*New Mnemonical Chart and Guide to the Art of Memory,* 1845), Rev. T. Brayshaw (*Metrical Mnemonics,* a very rare work), Fairchild and W. Stokes, the next name of any importance is the Rev. J. H. Bacon, a pupil of Edward Pick. His book (*A Complete Guide to the Improvement of the Memory,* 3rd ed., rev. 1890) contains a good summary of the history of mnemonics and a very reasonable account of the principles; it gains in value by its comparative simplicity. More or less successful systems were issued by Lyon Williams (1866), T. Maclaren (1866), Thomas A. Sayer (1867), Rev. Alexander Mackay (1869), George Crowther (1870), F. Appleby (1880), John Sambrook, who made use of similarities in sounds (gun, 1; Jew, 2), the French scientist Abbé Moigno, J. H. Noble and Allan Dalzell. Considerable interest was roused both in London and in America by the controversy which raged round the system of "Alphonse Loisette," who taught his "art of never forgetting" successively in London and Washington. It claimed to be original in system, but was attacked in England by F. Appleby and in America by George S. Fellows, and is generally regarded as both unoriginal and inferior on the whole to preceding systems (for the litigation in America see *e.g.,* Part II. of Middleton's *Memory Systems,* pp. 96 *sqq.*). An interesting work (*Memoranda mnemonica*) was published by James Copner in 1893, containing a system based partly on the use of letters for figures and words for dates, as well as a large number of rhymes for remembering facts in biblical, Roman, Greek and English history. He made use of Grey's system, but endeavoured as far as possible to invent, where necessary, words and terminations

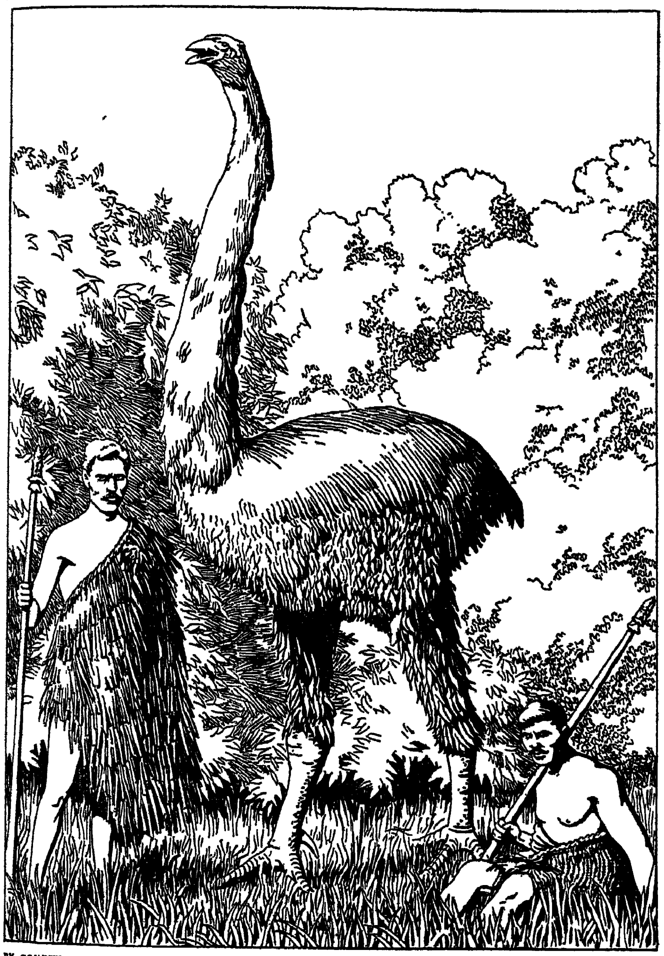
which in themselves had some special fitness in place of Grey's monstrosities. More complicated systems are the *Keesing Memory System* (Auckland, 1896), the Smith-Watson *System of Memory and Mental Training* (Washington), and the Pelman memory system.

Bibliography.—A large number of the works referred to in the text contain historical material. Among histories of the subject, see C. F. von Aretin, *Systematische Anleitung zur Theorie und Praxis der Mnemonik* (Sulzberg, 1810); A. E. Middleton, *Memory Systems, Old and New* (espec. 3rd rev. ed., New York, 1888), with bibliography of works from 1325 to 1888 by G. S. Fellows and account of the Loisette litigation; F. W Colegrove, *Memory* (1901), with bibliography, pp. 353–361. (J. M. M.)

MNESICLES, the architect of the great Propylaea of the Athenian Acropolis, set up by Pericles about 437 B.C.

MOA, the Maori name of the extinct Ratite birds, comprising the New Zealand group *Dinornithes* (*see* Bird and Ratitae). In the North Island the moas seem to have died out some 500–700 years ago, soon after the arrival of the Maoris. In South Island they lingered much longer, possibly even down to the time that Captain Cook visited New Zealand. Numerous bones have been found in caves and swamps.

The wings and shoulder-girdle, except for a few vestiges in one species (*Anomalopteryx dromaeoides*), had entirely disappeared.



BY COURTESY OF THE NEW ZEALAND HIGH COMMISSIONER

THE MOA (DINORNIS MAXIMUS), NOW EXTINCT, RECONSTRUCTED TO SHOW ABSENCE OF WINGS AND GREAT SIZE COMPARED WITH A MAORI WARRIOR, NEW ZEALAND

There is no trace of a keel on the sternum. The hind limbs were very strong and ended in four toes. The bill was short and stout and the feathers had a large after-shaft. The moas varied from the 12ft. high *Dinornis maximus* to the size of a turkey. Their affinities are with the Australian Ratites, especially with the kiwis. Moas are known only as far back as the Pliocene, and seem to have been herbivorous.

MOAB, the name of an ancient people of Palestine who inhabited a district east of the Jordan and the Dead sea, lying north of Edom and south of Ammon (*q.v.*). The national traditions of the Israelites (*see* Jews) recognize a close relationship between Moab and Ammon, "sons" of Lot, and the "brothers" Esau (Edom) and Jacob (Israel), and Moab is represented as already a powerful people when Israel fled from Egypt (Exod. xv. 15). It was supposed that Moab, having expelled the aboriginal giants, was in turn displaced by the Amorite king Sihon, who forced Moab south of the Arnon (Wadi Mōjib, a natural boundary) and drove Ammon beyond the Jabbok. The Israelites at Kadesh, almost at the gate of the promised land, incurred the wrath of Yahweh, and, deterred by a defeat at Hormah from pursuing their journey northwards, chose another route (Num. xiv. 40–45; contrast xxi. 1–3). A great detour was made round by the south of Edom (Num. xiv. 25, xxi. 4; Judges xi. 18), and the people reached Pisgah in Moab (Num. xxi. 16–20; *cf.* Deut. iii. 27, xxxiv. 1), or, according to another view, passed outside Moab until they reached the border of Sihon's kingdom (Num. xxi. 13, 26; Judges xi. 17 *seq.*). The late list in Num. xxxiii. even seems to assume that the journey was made from Kadesh across the northern end of Edom. Apparently no fixed or distinct tradition existed regarding the journeys; and it is extremely probable that some of the most characteristic features of the narratives belong to much later periods than the latter half of the second millennium B.C., the age to which they are ascribed (*e.g.*, the poem on the fall of Heshbon, Num. xxi. 27–30).

The history of the "brothers" Moab and Ammon was bound up with that of Judah and Israel respectively and depended, to a considerable extent, upon these two and their mutual relations. Jephthah (*q.v.*), one of the Israelite "judges," delivered Gilead from Ammon, who resumed the attack under its king Nahash, only to be repulsed by Saul (*q.v.*). Ehud (*q.v.*) of Benjamin or Ephraim freed Israel from the Moabite oppression. To the first great kings, Saul and David, are ascribed conquests over Moab, Ammon, and Edom. The Judaean David, for his part, sought to cultivate friendly relations with Ammon, and tradition connects him closely with Moab. His son Solomon contracted marriages with women of both states (1 Kings xi. 5, 7), thus introducing into Jerusalem cults which were not put down until almost at the close of the monarchy (2 Kings xxiii. 13). In the 9th century B.C. the two states appear in a more historical light, thanks to the Assyrian records and a lengthy Moabite inscription.

This latter inscription, now in the Louvre, was found at Dhībān, the biblical Dībōn, in 1868. It contains a record of the successes gained by the Moabite king Mesha against Israel. Omri (*q.v.*) had previously seized a number of Moabite cities north of the Arnon, and for 40 years the Moabite national god Chemosh was angry with his land. At length he roused Mesha; and Moab, which had evidently retreated southwards towards Edom, now began to take reprisals. "The men of Gad had dwelt in the land of Ataroth from of old; and the king of Israel built Ataroth for himself." Mesha took the city, slew its people in honour of Chemosh, and dragged before the god the altar-hearth (or the priests?) of D-v-d-h (apparently a divine name, but curiously similar to David). Chemosh next roused Mesha against the city of Nebo. It fell with its thousands, for the king had "devoted" it to the deity ʿAshtar-Chemosh. Yahweh had been worshipped there, and his . . . (?vessels, or perhaps the same doubtful word as above) were dragged before the victorious Chemosh. With the help of these and other victories (at Jahaz, Aroer, etc.), Moab recovered its territory, fortified its cities, supplied them with cisterns, and Mesha built a great sanctuary to his god. The inscription enumerates many places known elsewhere. (Isa. xv.; Jer. xlviii.), but, although it mentions the "men of Gad," makes no allusion to the Israelite tribe Reuben, whose seat lay in the district (Num. xxxii.; Josh. xiii. 15–23; *see* Reuben). The revolt will have followed Ahab's death (*see* 2 Kings i. 1) and apparently led to the unsuccessful attempt by Jehoram to recover the lost ground (*ibid.* iii.).

Moab thus retained its independence, even harrying Israel with marauding bands (2 Kings xiii. 20), while Ammon was perpetrating cruelties upon Gilead (Am. i. 13 *sqq.*). But under Jeroboam II. (*q.v.*) Israelite territory was extended to the Wadi of the ʿArabah or wilderness (probably south end of the Dead sea), and

again Moab suffered. If Isa. xv. *seq.* is to be referred to this age, its people fled southwards and appealed for protection to the overlord of Edom (*see* Uzziah). During the Assyrian supremacy its king Salamannu paid tribute to Tiglath-Pileser III., but joined the short-lived revolt with Judah and Philistia in 712. When Sennacherib besieged Jerusalem in 700, Kamus (Chemosh)-nadab also submitted; and subsequently both Esarhaddon and Assur-bani-pal received tribute from the Moabite king Muṣuri ("the Egyptian"). During the reign of Assur-bani-pal Moab helped to repulse the invasion of the Nabayati and nomads of Kedar, a movement which made itself felt from Edom nearly as far as Damascus. It had its root in the revolt of Shamash-shum-ukin of Babylonia, and, coming at a time immediately preceding the disintegration of the Assyrian empire, had important consequences for Judah and the east of the Jordan.

Later, Moab joined the coalition against Babylonia (Jer. xxvii. 3), and if it is condemned for its joy at the fall of Jerusalem (Isa. xxv. 9 *seq.;* Jer. xlviii.; Ezek. xxv. 8–11; Zeph. ii. 8–10), it harboured fugitive Jews (Jer. xl. 11): the dates of the most significant passages are unfortunately uncertain. If Sanballat the Horonite was really a native of the Moabite Horonaim, he finds an appropriate place by the side of Tobiah the Ammonite and Gashmu the Arabian among the strenuous opponents of Nehemiah. Still later we find Moab part of the province of Arabia in the hands of fresh tribes from the Arabian desert (Jos. *Ant.* xiii. 13, 5); and, with the loss of its former independent power, the name survives merely as a type (Dan. xi. 41).

As Mesha's inscription proves, Moab had reached a high state of civilization by the 9th century B.C. Its language differed only dialectically from Hebrew; its religion and culture were very closely akin to the Israelite. The relation of Chemosh, the national god, to his "children" (Num. xxi. 29) was that of Yahweh to Israel (Judges xi. 24). Apart from the religious cult suggested in the name Mount Nebo, there were local cults of the Baal of Peor and the Baal of Meon; and Mesha's allusion to ʻAshtar-Chemosh, a compound deity, has been taken to point to a corresponding consort whose existence might naturally be expected upon other grounds (*see* Astarte). The fertility of Moab, the wealth of wine and corn, the temperate climate, and the enervating heat supply conditions which directed the form of cult. Nature-worship, as in Israel, prevailed, and the impure rites of Shittim and Baal-Peor (Num. xxxi. 16; Ps.cvi. 28) would not materially differ from practices which Israelite prophets condemn. The kinship of Israel with the external states (Moab, Edom, and Ammon) is entirely justified. It extends intermittently throughout the history. But Israel remained a great power while Moab disappeared. It is true that Moab was continuously hard pressed by desert hordes; the exposed condition of the land is emphasized by the chains of ruined forts and castles which even the Romans were compelled to construct. But the explanation is to be found within Israel itself, and especially in the work of the prophets.

Smith and Wellhausen); also the popular description by Libbey and Hoskins, *Jordan Valley and Petra* (1905), and the invaluable works of Brünnow and A. von Domaszewski, *Die Provincia Arabia* (1904–5), and A. Musil, *Arabia Petraea* (1907–08). For the Moabite inscription of Mesha *see* G. A. Cooke *North Semitic Inscriptions* pp. 1–14, and the articles "Mesha" in *Ency. Bib.* (S. R. Driver) and "Moab" in Hastings' *Dict. Bible* (W. H. Bennett). (S. A. C.)

MOʻALLAQĀT (or Muʻallaqāt). *Al-Moʻallaqāt* is the title of a group of seven longish Arabic poems, which have come down to us from the time before Islam. The name signifies "the suspended" (pl.), the traditional explanation being that these poems were hung up by the Arabs on or in the Kaʻba at Mecca. Against this we have the testimony of the grammarian Nāḥḥās (d. A.D. 949), who says in his commentary on the Moʻallaqāt: "As for the assertion that they were hung up in [*sic*] the Kaʻba, it is not known to any of those who have handed down ancient poems." (Ernst Frenkel, *An-Nāḥḥās' Commentar zur Muʻallaqa Imruul-Qais* [Halle, 1876], p. viii.) This cautious scholar is unquestionably right in rejecting a story so utterly unauthenticated.

That a series of long poems was *written* at all at that remote period is improbable in the extreme. Up to a time when the art of writing had become far more general than it was before the spread of Islam, poems were never—or very rarely—written, with the exception, perhaps, of epistles in poetic form. The diffusion of poetry was exclusively committed to *oral* tradition. The legend that the poems were written in gold evidently originated in the name "the golden poems" (literally "the gilded"), a figurative expression for excellence. We may interpret the designation "suspended" on the same principle. It seems to mean those (poems) which have been raised, on account of their value, to a specially honourable position.

The selection of these seven poems can scarcely have been the work of the ancient Arabs at all. It is much more likely that we owe it to some connoisseur of a later date. Now Nāḥḥās says expressly: "The true view of the matter is this: when Ḥammād ar-Rāwiya (Ḥammād the Rhapsodist) saw how little men cared for poetry, he collected these seven pieces, urged people to study them, and said to them: 'These are the [poems] of renown.'" And this agrees with all our other information. Ḥammād (who lived in the first three quarters of the 8th century A.D.) was perhaps of all men the one who knew most Arabic poetry by heart. The recitation of poems was his profession. To such a rhapsodist the task of selection is in every way appropriate; and it may be assumed that he is responsible also for the somewhat fantastic title of "the suspended."

There is another fact which seems to speak in favour of Ḥammād as the compiler of this work. He was a Persian by descent, but a client of the Arab tribe, Bakr ibn Wāil. For this reason, we may suppose, he not only received into the collection a poem of the famous poet Ṭarafa, of the tribe of Bakr, but also that of another Bakrite, Ḥārith, who, though not accounted a bard of the highest rank, had been a prominent chieftain; while his poem could serve as a counterpoise to another also received—the celebrated verses of Ḥārith's contemporary ʻAmr, chief of the Taghlib, the rival brethren of the Bakr. ʻAmr praises the Taghlib in glowing terms: Ḥārith, in a similar vein, extolls the Bakr—ancestors of Ḥammād's patrons. The collection of Ḥammād appears to have consisted of the same seven poems which are found in our modern editions, composed respectively by Amra'al-Qais, Ṭarafa, Zuhair, Labīd, ʻAntara ibn Shaddād, ʻAmr ibn Kulthūm, and Ḥarith ibn Ḥilliza. These are enumerated both by Ibn ʻAbd-Rabbihi, and, on the authority of the older philologists, by Nāḥḥās; and all subsequent commentators seem to follow them. We have, however, evidence of the existence, at a very early period, of a slightly different arrangement. Certainly we cannot now say, on the testimony of the *Jamharat ash'ār al ʻArab*, that two of the most competent ancient authorities on Arabic poetry, Mofaḍḍal (d. *c.* 790) and Abū ʻUbaida (d. A.D. 824, at a great age), had already assigned to the "Seven" (viz. "the seven Moʻallaqāt") a poem each of Nābigha and Aʻshā in place of those of ʻAntara and Ḥārith. For meanwhile it has been discovered that the compiler of the above-mentioned work—who, in order to deceive the reader, issued it under a false name—is absolutely untrustworthy. But the learned Ibn Qotaiba (9th century A.D.), in his book *Of Poetry and Poets,* mentions as belonging to the "Seven" not only the poem of ʻAmr, which has invariably been reckoned among the Moʻallaqāt (ed. de Goeje, p. 120), but also a poem of ʻAbīd ibn Abraṣ (*ibid.* 144). In place of which poem he read this we do not know; and we are equally ignorant as to whether he counted other pieces than those indicated above among the seven.

Now Nābigha and Aʻshā enjoyed greater celebrity than any of the poets represented in the Moʻallaqāt, with the exception of Amra'al-Qais, and it is therefore not surprising that scholars, of a somewhat later date, appended a poem by each of these to the Moʻallaqāt, without intending by this to make them an integral part of that work. This is clear, for instance, from the introductory words of Tībrīzī (d. A.D. 1109) to his commentary on the Moʻallaqāt. Appended to this he gives a commentary to a poem of Nābigha, to one of Aʻshā, and moreover one to that poem of ʻAbīd which, as we have just seen, Ibn Qotaiba had

counted among the seven. It is a pure misunderstanding when Ibn Khaldūn (*loc. cit.*) speaks of *nine* Moʿallaqāt; and we ought hardly to lay any stress on the fact that he mentions not only Nābigha and Aʿshā, but also ʿAlqama, as Moʿallaqa-poets. He was probably led to this by a delusive recollection of the Collection of the "Six Poets," in which were included these three, together with the three Moʿallaqa-poets, Amra'al-Qais, Zuhair and Ṭarafa.

The lives of these poets were spread over a period of more than a hundred years. The earliest of the seven was Amra'al-Qais (*q.v.*), regarded by many as the most illustrious of Arabian poets. His exact date cannot be determined; but probably the best part of his career fell within the midst of the 6th century. He was a scion of the royal house of the tribe Kinda, which lost its power at the death of King Ḥārith ibn ʿAmr in the year 529. (See *Tabari's Geschichte der Perser und Araber . . . übersetzt von Th. Nöldeke* [Leiden, 1879], p. 171.) The poet's royal father, Ḥojr, by some accounts a son of this Ḥārith, was killed by a Bedouin tribe, the Banū Asad. The son led an adventurous life as a refugee, now with one tribe, now with another, and appears to have died young. The anecdotes related of him as well as his poems, imply that the glorious memory of his house and the hatred it inspired were still comparatively fresh, and therefore recent. A contemporary of Amra'al-Qais was ʿAbīd ibn Abraṣ, one poem of whose, as we have seen, is by some authorities reckoned among the collection. He belonged to the Banū Asad, and is fond of vaunting the heroic deed of his tribe—the murder of Ḥojr—in opposition to the victim's son, the great poet.

The Moʿallaqa of ʿAmr hurls defiance against the king of Ḥira, ʿAmr son of Mundhir, who reigned from the summer of 554 till 568 or 569, and was afterwards slain by our poet. (*See* Nöldeke's *Tabarī*, pp. 170, 172.) This prince is also addressed by Ḥārith in his Moʿallaqa. Of Ṭarafa, who is said to have attained no great age, a few satirical verses have been preserved, directed against this same king. This agrees with the fact that a grandson of the Qais ibn Khālid, mentioned as a rich and influential man in Ṭarafa's Moʿallaqa (v. 80 or 81), figured at the time of the battle of Dhū-Qār, in which the tribe Bakr routed a Persian army. This battle falls between A.D. 604 and 610.

The Moʿallaqa of ʿAntara and that of Zuhair contain allusions to the feuds of the kindred tribes ʿAbs and Dhobyān. Famous as these contests were, their time cannot accurately be ascertained. But the date of the two poets can be approximately determined from other data. Kaʿb, son of Zuhair, composed first a satire, and then, in the year 630, a eulogy on the Prophet; another son, Bujair, had begun, somewhat sooner, to celebrate Mahomet. ʿAntara killed the grandfather of Aḥnaf ibn Qais, who died at an advanced age in A.D. 686 or 687; he outlived ʿAbdallāh ibn Ṣimma, whose brother Duraid was a very old man when he fell in battle against the Prophet (early in A.D. 630); and he had communications with Ward, whose son, the poet ʿOrwa, may perhaps have survived the flight of Mahomet to Medina. From all these indications we may place the productive period of both poets in the end of the 6th century.

To the same period appears to belong the poem of ʿAlqama, which, as we have seen, Ibn Khaldūn reckons amongst the Moʿallaqāt. This too is certainly the date of Nābigha, who was one of the most distinguished of Arabic poets. For in the poem often reckoned as a Moʿallaqa, as in many others, he addresses himself to Noʿmān, king of Ḥīra, who reigned in the two last decades of the 6th century. The same king is mentioned as a contemporary in one of ʿAlqama's poems.

The poem of Aʿsha, sometimes added to the Moʿallaqāt, contains an allusion to the battle of Dhū Qār (under the name "Battle of Ḥinw," v. 62). This poet, not less famous than Nābigha, lived to compose a poem in honour of Mahomet, and died not long before A.D. 630.

Labīd is the only one of these poets who embraced Islam. His Moʿallaqa, however, like almost all his other poetical works, belongs to the Pagan period. He is said to have lived till 661, or even later; certainly it is true of him, what is asserted with less likelihood of several others of these poets, that he lived to a ripe old age.

The seven Moʿallaqāt, and also the poems appended to them, represent almost every type of ancient Arabian poetry in its excellences and its weaknesses. In order rightly to appreciate these, we must translate ourselves into the world of the Bedouin, and seek to realize the peculiar conditions of his life, together with the views and thoughts resulting from those conditions. In the Moʿallaqa of Ṭarafa we are repelled by the long, anatomically exact description of his camel; but such a description had an extraordinary charm of its own for the Bedouins, every man of whom was a perfect connoisseur on this subject down to the minutest points; and the remaining parts of the poem, together with the other extant fragments of his songs, show that Ṭarafa had a real poetic gift. In the Moʿallaqāt of ʿAmr and Ḥārith, for the preservation of which we are especially grateful to the compiler, we can read the haughty spirit of the powerful chieftains, boastfully celebrating the splendours of their tribe. These two poems have also a certain historical importance. The song of Zuhair contains the practical wisdom of a sober man of the world. The other poems are fairly typical examples of the customary *qaṣīda*, the long poem of ancient Arabia, and bring before us the various phases of Bedouin life.

It is a phenomenon which deserves the fullest recognition, that the needy inhabitants of a barren country should thus have produced an artistic poetry distinguished by so high a degree of uniformity. Even the extraordinary strict metrical system, observed by poets who had no inkling of theory and no knowledge of an alphabet, excites surprise. In the most ancient poems the metrical form is as scrupulously regarded as in later compositions. The only poem which shows unusual metrical freedom is the song of ʿAbīd. It is, however, remarkable that ʿAbīd's contemporary Amra'al-Qais, in a poem which in other respects also exhibits certain coincidences with that of ʿAbīd (No. 55, ed. Ahlwardt), allows himself considerable licence in the use of the very same metre—one which, moreover, is extremely rare in the ancient period. Presumably, the violent deviations from the *schema* in ʿAbīd are due simply to incorrect transmission by compilers who failed to grasp the metre. The other poems ascribed to ʿAbīd, together with all the rest attributed to Amra'al-Qais, are constructed in precise accord with the metrical canons. It is necessary always to bear in mind that these ancient poems, which for a century or more were preserved by oral tradition alone, have reached us in a much mutilated condition. Fortunately, there was a class of men who made it their special business to learn by rote the works either of a single poet or of several. The poets themselves used the services of these rhapsodists (rāwī). The last representative of this class is Ḥammād, to whom is attributed the collection of the Moʿallaqāt; but he, at the same time, marks the transition of the rhapsodist to the critic and scholar. The most favourable opinion of the rhapsodists would require us to make allowance for occasional mistakes: expressions would be transposed, the order of verses disarranged, passages omitted, and probably portions of different poems pieced together. It is clear, however, that Ḥammād dealt in the most arbitrary fashion with the enormous quantity of poetry which he professed to know thoroughly. The seven Moʿallaqāt are indeed free from the suspicion of forgery, but even in them the text is frequently altered and many verses are transposed. The loose structure of Arabic poems was extremely favourable to such alterations. Some of the Moʿallaqāt have several preambles: so, especially, that of ʿAmr, the first eight verses of which belong not to the poem but to another poet. Elsewhere, also, we find spurious verses in the Moʿallaqāt. Some of these poems, which have been handed down to us in other exemplars besides the collection itself, exhibit great divergences both in the order and number of the verses and in textual details. This is particularly the case with the oldest Moʿallaqa—that of Amra'al-Qais—the critical treatment of which is a problem of such extreme difficulty that only an approximate solution can ever be reached. The variations of the text, outside the Moʿallaqāt collection, have here and there exercised an influence on the text of that collection. It would be well if our manuscripts at least gave the Moʿallaqāt in the exact

form of Ḥammād's days. The best text—in fact, we may say, a really good text—is that of the latest Mo'allaqa, the song of Labīd.

The Mo'allaqāt exist in many manuscripts, some with old commentaries, of which a few are valuable. They have also been several times printed. Especial mention is due to the edition of Charles (afterwards Sir Charles) Lyall with the commentary of *Tibrīzī* (Calcutta, 1894). Attempts to translate these poems, verse for verse, in poetical form, could scarcely have a happy result. The strangeness, both of the expression and of the subjects, only admits of a paraphrastic version for large portions, unless the sense is to be entirely obliterated. An attempt at such a translation, in conjunction with a commentary based on the principles of modern science, has been made by the present author: "Fünf Mo'allaqāt übersetzt und erklärt," in the *Sitzungsberichte der kais. Akad. d. Wiss. in Wien. Philos.-hist. Classe*. Bde. cxl.–cxiv. A supplement to this is formed by an article, by Dr. Bernh. Geiger, on the Mo'allaqa of Ṭarafa, in the *Wiener Zeitschrift für die Kunde des Morgenlands*, xix. 323 *sqq*. *See* further the separate articles on the seven poets. (Th. N.; X.)

MOAT, a depression surrounding a castle, city wall or other fortification, usually, but not always, filled with water. The existence of a moat was a natural result of early methods of fortification by earthworks, for the ditch produced by the removal of earth to form a rampart made a valuable part of the defence system. When, in the middle ages, earthworks gave way to masonry walls, the moat was retained, and became even more valuable than before, as it prevented moving towers or battering rams from being brought up to the ramparts until the moat had been filled. With the development of fire-arms the moat lost much of its importance, but was occasionally retained into the 18th century, as an obstacle against infantry attacks. Dry moats or ditches, as parts of modern earthworks, still occur spasmodically. (*See* Castle, Fortification and Siegecraft. For a thorough consideration of mediaeval moats, *see* Viollet-le-Duc, *Dictionnaire Raisonné*, articles "Architecture Militaire" and "Château.")

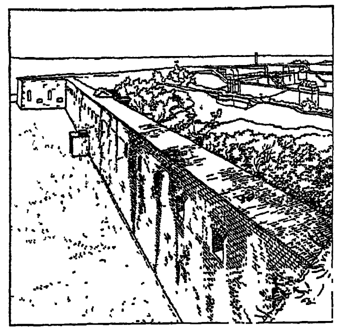
MOBERLY, GEORGE (1803–1885), English divine, was born on Oct. 10, 1803, and educated at Winchester and Balliol college, Oxford. He was head master of Winchester from 1835 to 1866. Mr. Gladstone made him bishop of Salisbury in 1869. Though Moberly left Oxford at the beginning of the Oxford movement, he formed an intimate friendship with Keble. In 1872 he astonished his High Church friends by joining in the movement for the disuse of the damnatory clauses in the Athanasian Creed. His chief contribution to theology is his Bampton Lectures of 1868, on *The Administration of the Holy Spirit in the Body of Christ*. He died on July 6, 1885.

His son, Robert Campbell Moberly (1845–1903) became regius professor of pastoral theology at Oxford. He contributed to *Lux Mundi* (1889), and wrote *Atonement and Personality* (1901).

MOBERLY, a city of Randolph county, Missouri, U.S.A., 135 m. N.W. of Saint Louis; on Federal highways 24 and 63, and served by the Missouri-Kansas-Texas and the Wabash railways. Pop. (1920) 12,808 (91% native white); and was 13,772 Federal census 1930. It is a shipping point for farm produce, live stock, wool, hides and hardwood lumber, and has a number of manufacturing industries, including a shoe factory, hosiery mills, a cheese plant and large repair shops of the Wabash company (established in 1872), with an output in 1925 valued at $4,133,565. Coal is mined in the vicinity. Moberly was platted in 1866; became the county seat in 1868; and a city in 1873.

MOBILE, a city of south-western Alabama, U.S.A., at the head of Mobile bay on the Gulf of Mexico (30 m. long and 8 m. wide); county seat of Mobile county. It is on Federal highways 45 and 90; has a municipal airport; and is served by the Alabama, Tennessee and Northern, the Gulf, Mobile and Northern, the Louisville and Nashville, the Mobile and Ohio and the Southern railways, and by 40 ocean steamship lines and the barges of the Inland Waterways Corporation (Mississippi-Warrior Service). Pop. (1920) 60,777 (39% negroes); and was 68,202 Federal census 1930, with an additional 15,000 in adjacent suburbs, making the total for the metropolitan area about 85,000.

Mobile is the only seaport of Alabama, and until 1900 was its largest city. It occupies 20 sq.m. of a sandy plain. The Cochrane bridge and causeway, 10·5 m. long (completed 1927) crosses the delta of the Mobile river and the headwaters of the bay, providing an uninterrupted passage by highway over the Old Spanish trail from Florida to California. The land-locked fresh water harbour, formed by the lower 5 m. of the Mobile river, is connected with the Gulf by a 30 ft. channel and has ample anchorage. To June 30, 1926, the Federal Government had spent $10,352,265 (spread over a century) in deepening the harbour and channel, which originally had a usable depth of only 5·5 feet. Extensive docks and terminal facilities (completed 1928) have been built by the State at a cost of $10,000,000. The U.S. quarantine station occupies Sand island, at the entrance to the river. Pinto and Blakely islands, opposite the city, are occupied by dry-docks and ship-building yards, coaling stations and oil-tank farms. The U.S. Steel Corporation owns large tracts of land at Chickasaw, and other industrial developments fringe the north-west boundary of the city. Five miles west is Spring Hill college, founded (1830) and conducted by Jesuits. There are 18th century buildings in the city, many residences of both ante-bellum and modern construction. The city's assessed valuation for 1927 was $54,041,849. Since 1911 it has had a commission form of government. Mardi Gras has been celebrated annually since 1830.



BY COURTESY OF THE MOBILE CHAMBER OF COMMERCE

OLD FORT GAINES, AT THE ENTRANCE TO MOBILE BAY

The harbour traffic in 1926 was 3,193,166 tons, valued at $121,878,580, of which $37,058,400 represented exports (mainly raw cotton, lumber and timber, iron and steel products) and $9,224,134 imports (largely sodium nitrate, bananas, manganese and manganese ore and molasses). Garden truck and small fruits are the leading money crops of the region. Over 2,000 carloads of cabbage and $1,000,000 worth of satsuma oranges and pecans are shipped annually, and the county boasts a "cabbage patch" of 500 acres. The output of the manufacturing industries was valued at $30,913,553 in 1927. Bank debits in 1926 aggregated $469,888,000.

Mobile was founded in 1702 and was the capital of the French province of Louisiana until 1720. The name was taken from the Mobile or Maubila Indians, who then occupied the region. By the Treaty of Paris (1763) Mobile was ceded to Great Britain; in 1780 it was captured by a Spanish force; in 1813 it was seized for the United States by Gen. James Wilkinson, and in Aug. 1814 Gen. Andrew Jackson made it his headquarters, resisting an attack (Sept. 15) by the British on Ft. Bowyer at the mouth of the bay. After the War of 1812 American immigrants rapidly changed the French character of the place. A town charter was received from the territorial legislature of Mississippi in 1814; a city charter from the first State legislature of Alabama, in 1819. Throughout the 19th century it was the commercial metropolis of Alabama and Mississippi. Cotton exports increased from 7,000 bales in 1818 to 450,000 in 1840 and 1,000,000 in 1861.

During the Civil War Mobile was an important port of the Confederacy. Despite a Federal blockade begun in 1861, trade with the West Indies and Europe was kept up by a line of swift vessels. In 1864 Admiral Farragut entered the channel, captured the Confederate ironclad ram "Tennessee," destroyed one gunboat and drove another aground, losing the Federal monitor "Tecumseh." Ft. Gaines, on Dauphin island, surrendered on August 7; Ft. Morgan, on Mobile Point, on August 23. In the spring of 1865 Gen. E. R. S. Canby laid siege to Ft. Blakely and Spanish Fort, on the east side of the bay. After 25 days the forts, and then the city, were evacuated, and the Federal forces entered the city on April 12. In 1879, in consequence of railway losses and the financial disturbance of 1873, the municipality became bankrupt. Its charter was vacated; trustees acting under the chancery court were appointed; and a temporary municipal government, called the Port of Mobile, was established. In 1887 the city of Mobile was again chartered. A hurricane on Sept. 27, 1906, destroyed

property valued at over $5,000,000.

MOBILIZATION, the preparation of an army for active service (from Latin *mobile* and French *mobile*), and its passage from a peace to a war footing. It is of vital importance that the period of mobilization shall be as short as possible, as victory in the first battles and even the results of the whole war may be jeopardized by any avoidable delay in this process. Thus every army is constantly endeavouring to speed up its mobilization by providing for contingencies. On the issue of the order much has to be done. Reservists have to be called up, clothed, armed and equipped, fed and sent to the units into which they are to be incorporated. Arms, ammunition, equipment, vehicles and stores not issued in peace time but necessary in war have to be provided and distributed; and any similar material in possession of units but not required for active service or defective must be returned to store or replaced. Special promotions and appointments must be made and notified; a number of new units and formations will have to be raised and fitted out; and everything must be ready by the time appointed for each unit to commence its move to its concentration area or port of embarkation in accordance with the time-table drawn up in peace time. All this complicated process requires a complete programme for each formation and unit, showing what is to be done on each day of the mobilization period; these programmes are revised at frequent intervals and subjected to partial tests. (*See* also ARMY.)

MÖBIUS, AUGUST FERDINAND (1790–1868), German astronomer and mathematician, was born at Schulpforta on Nov. 17, 1790. At Leipzig, Göttingen and Halle he studied for four years, and in 1815 became professor of astronomy at Leipzig, being chosen director of the university observatory, which was erected (1818–1821) under his superintendence. He died on Sept. 26, 1868. His doctor's dissertation, *De computandis occultationibus fixarum per planetas* (Leipzig, 1815), established his reputation as a theoretical astronomer. *Die Hauptsätze der Astronomie* (1836), *Die Elemente der Mechanik des Himmels* (1843), may be noted amongst his other purely astronomical publications. His labours in pure mathematics appear for the most part in *Crelle's Journal* from 1828 to 1858. These papers are chiefly geometrical, many of them being developments and applications of the methods laid down in his great work, *Der barycentrische Calcul* (Leipzig, 1827), which, as the name implies, is based upon the properties of the mean point or centre of mass. (*See* ALGEBRA: *Universal.*) This work abounds in suggestions and foreshadowings of some of the most striking discoveries in more recent times—such, for example, as are contained in H. Grassmann's *Ausdehnungslehre* and Sir W. R. Hamilton's *Quaternions.* Möbius was a leader in the introduction of the powerful methods of modern projective geometry.

His *Gesammelten Werke* were published at Leipzig, (4 vols., 1885–1887).

(2) Theodor, son of the last-named, Scandinavian authority, born at Leipzig, June 22, 1821. Among many papers and writings, his *Catalogas librorum islandicorum et Norvegicorum aetatis mediae* (1856) and *Verzeichnis der auf dem Gebiet der altnordischen Sprache und Literatur 1855 bis 1879 erschienenen Schriften* (1880) as keys to Scandinavian bibliography, and his *Edda-Ausgabe* as a text-book, are perhaps the most valuable to students. He died in Leipzig, April 25, 1890.

MOCATTA, FREDERICK DAVID (1828–1905), English Jewish philanthropist, was a member of the London financial firm, Mocatta and Goldsmid, but retired from business in 1874 and devoted himself to works of public and private benevolence.

He first began to give his attention to the better housing of the working classes, and the administration of charity in such a manner as not to demoralise the poor. He literally supported almost every hospital in London.

Mocatta did much to promote education, especially that of the Jewish poor, and he encouraged Jewish literature and research. Besides this he was a patron of learning and himself an author of historical works, the chief of which was *The Jews and the Inquisition.* On occasion of his 70th birthday, he was presented with a testimonial from more than 200 philanthropic and literary institutions. The Anglo-Jewish Historical Exhibition (1887) owed its inception to him. He bequeathed his fine library to the Jewish Historical Society of England, of which he was at one time president. This library formed the basis of the collections which are now included in the Mocatta Library and Museum, founded in his memory, and located at the University of London (University College, Gower Street).

See *Trans. Jewish Hist. Soc. Eng.* vol. v.

MOCCASIN, a shoe made of deerskin or other soft leather. It is made in one piece; the sole is soft and flexible and the upper part is often adorned with embroidery, beading or other ornament. It is the footwear of the North American Indian tribes and is also worn by hunters, traders and settlers. In botany, the lady's slipper is known in the United States as the "moccasin flower."

MOCCASIN SNAKE (*Ancistrodon piscivorus*), a venomous viviparous aquatic snake of the southern United States, also called cottonmouth (from the white rim round its mouth) and water moccasin. It belongs to the pit-viper family, Crotalidae (*see* SNAKES), which also includes the rattlesnake (*q.v.*). The moccasin may reach four feet in length. It feeds largely on frogs and fishes and is one of the most deadly of American snakes. The allied copperhead (*q.v.*) is sometimes called the upland moccasin. It has a more northerly range. Moccasins are coloured dark olive-brown above, and yellowish-brown below, with dark bars and blotches. They are darker than the copperhead, being without the bright tints of the latter. The top of the head is mostly covered with scales like those of the back, instead of large regular plates as in the case of harmless snakes. The head is flat and broad. The water moccasin is mimicked by the harmless false moccasin (*Natrix*), a smaller water-snake with a narrow and less triangular head and a double row of scales on the underside of the tail.

MOCENIGO, the name of a noble and ancient Venetian family which included many doges, statesmen and soldiers. TOMMASO MOCENIGO (1343–1423) commanded the crusading fleet in the expedition to Nicopolis in 1396, and also won battles against the Genoese. While Venetian ambassador at Cremona he was elected doge (1414), and he escaped in secret, fearing that he might be held a prisoner by Gabrino Fondolo, tyrant of that city. He made peace with the Turkish sultan, but when hostilities broke out afresh his fleet defeated that of the Turks at Gallipoli. During his reign the patriarch of Aquileia was forced to cede his territories to the republic (1420), which also acquired Friuli and Dalmatia. Tommaso greatly encouraged commerce, reconstructed the ducal palace and commenced the library. PIETRO MOCENIGO, doge from 1474 to 1476, was one of the greatest Venetian admirals, and revived the fortunes of his country's navy after the defeat at Negropont in 1470. In 1472 he captured and destroyed Smyrna. He then defeated the Turks who were besieging Scutari and died of an illness contracted there. GIOVANNI MOCENIGO, Pietro's brother, doge from 1478 to 1485, fought against Mohammed II. and Ercole I., duke of Ferrara, from whom he recaptured Rovigo and the Polesine. LUIGI MOCENIGO was doge from 1570 to 1577. During his reign Venice lost the fortresses Nicosia and Famagosta in Cyprus. He took part in the battle of Lepanto, but after the loss of Cyprus he was forced to make peace with the Turks and to hand them back his conquests. ANDREA MOCENIGO, who flourished in the 15th and 16th centuries, was a senator of the republic and a historian; he composed a work on the league of Cambrai entitled *Belli memorabilis Cameracensis adversus Venetos historiae libri vi.* (Venice, 1525). Another LUIGI MOCENIGO was doge from 1700 to 1709, and his brother SEBASTIANO from 1722 to 1732. ALVISE MOCENIGO (1701–78), who was doge from 1763 until his death, restricted the privileges of the clergy, and in consequence came into conflict with Pope Clement XIII.

MOCHA STONE, a variety of chalcedony containing infiltrated dendritic oxides of manganese and iron which give it the appearance of containing vegetable remains. Most of the mocha stones of commerce are obtained from India, being found among the agate pebbles due to the disintegration of the trap rocks of the Deccan. Artificial stones are produced at Oberstein.

MOCKING-BIRD, popular name of birds belonging to the American family *Mimidae* including also the thrashers (*q.v.*). The northern mocking-bird (*Mimus polyglottus*) inhabits the southern part of U.S.A., visiting the north in summer and breeding, though rarely, in New England. West of the Alleghanies it is less numerous, though occurring in suitable localities across to the Pacific. The mocking-bird has a fine song of its own and, in addition, has a remarkable power of mimicry.

It is greyish-brown above and dull white below. The nest is often placed close to houses and is a careless structure. Three to six blue-green eggs, spotted with light brown, are laid. The great enemies of the mocking-bird are snakes, which eat both eggs and young; but the parents show great courage in defence of their home and often drive off the intruder.

Some 12 or 14 other species of *Mimus* occur, mostly in S. America. The catbird (*Dumatella carolinensis*) is another ally; it too has both a fine song and the power of mimicry. It is sooty-grey and has a wide range on the continent and extends to Bermuda.

MOCK ORANGE, the name given to various species of syringa (*q.v.*), especially to those with highly fragrant flowers, and also to the Missouri gourd or calabazilla (*Cucurbita foetidissima*), of the south-western United States, because of the resemblance of the globular fruit to small oranges. The leaves of the latter were used medicinally by the Spanish-Californians.

MOCOAN, a linguistic stock of South American Indians, whose name is derived from the Mocoas, one of its best-known tribes. The Mocoan tribes occupied a small territory on the eastern slope of the Cordillera Oriental in southern Colombia, directly east of Pasto, on the sources of the Putumayo river and between it and the upper Caqueta. Little or nothing of the character and culture of these tribes is known.

See A. F. Chamberlain, "Sur Quelques familles linguistiques . . . de l'Amerique du Sud" (*J. Soc. Americanistes de Paris* [n.s.], vol. vii. pp. 179–202).

MODELS AND MODEL-MAKING. The making of models is one of the oldest hobbies of mankind. The Egyptians, for instance, believed that the human spirit, after death, was capable of travelling on land, but required assistance across the waters of the Nile, so they buried with their dead a model boat called a "Spirit Ship" to assist the soul across the river.

An early model dealing with steam is described by Hero of Alexandria, about A.D. 120. A reconstruction of this model is in the South Kensington museum, London, and consists of a boiler with a flat top supported by a frame over a wood fire. The top of the boiler has a hollow ball mounted between two pivots, one of which acts as a steam-pipe leading through the boiler. On opposite sides of the ball are two nozzles bent at right angles so that when steam is generated and passes into the atmosphere it causes the ball to revolve rapidly. An early model-maker was the famous James Watt. He was born in 1736 and spent some of his early days in improving the model of a Newcomen engine which formed part of the Glasgow college equipment, from which experiment we gained the first practical steam engine. Later, William Murdock, who invented gas lighting, joined James Watt, and the experimental locomotive which Murdock built in 1786 was probably the first model locomotive in existence. It had a cylinder $\frac{3}{4}$ in. diameter.

Models are now commonly used for the demonstration of patents, inventions and experimental work both by engineering firms and private inventors. A few of the leading uses may be here enumerated. (1) For instructional purposes by schools, railway companies, technical colleges, physical laboratories, Admiralty, War Office and other Government departments. (2) For exhibition and publicity purposes, accurate reproductions to scale make it possible to show an article in precise detail within a limited space. Complete scale models are made for shipping companies and for engineering exhibitions. Sectional models are often made to explain internal constructions and the operation of special details. Architects now make extensive use of models for housing details, town-planning, suggestions for extensions to factories, the laying out of estates and the rearrangement of transport facilities. The law courts also make use of models in legal disputes about ancient lights or disagreements about extensions to buildings. Railway and motor-car accidents are modelled to show the positions of the trains or vehicles involved. (3) Last, but not least, there is the use of models for the instruction and amusement of the young, in the form of model railways, model power boats, sailing yachts and other high-class toys, in which scientific data play an important part.

Model-making as a hobby is almost peculiar to the British Isles and has many enthusiastic adherents, as witness the annual exhibitions held in London where amateur-made models are entered for competition. The production of scale models is almost exclusively in the hands of very small groups of craftsmen, in some cases working in their own homes or in small workshops; the chief reason being that very little machinery is required. The work demands great personal skill, repetition being almost unknown.

The commercial production of models on a large scale is mainly carried on in England, America and Germany; several firms in these countries give employment to 100 or 200 workpeople; one British firm, established at Northampton, covers the whole range of model-making, from the mass production of popular models to elaborate scale models costing hundreds of pounds each.

In addition to firms who devote themselves exclusively to model-making as a business, many of the leading engineering and shipbuilding companies have established model or experimental workshops where the new ideas are worked out in miniature. The South Kensington science museum, and other institutions have workshops where exhibits are made and repaired.

One of the finest examples of recent model-making, to which hundreds of craftsmen and artists contributed, was the Queen's doll's house designed by Sir Edward Lutyens. It represents the amenities of domestic life in the present century and is built to a scale of 1 in. to the foot. When shown at the Wembley Exhibition, it was seen by hundreds of thousands. In centuries to come this model, protected under its glass cover, will visualise civilization at the outset of the 20th century. (W. J. B.-L.)

MODENA (ancient *Mutina*), city, Emilia, Italy, capital of the province of Modena and seat of an archbishop, 31 m. E.S.E. of Parma by rail. Pop. (1921) 61,763 (town); 83,663 (commune). It lies in a damp, low plain on the south side of the Po valley, between the Secchia to the west and the Panaro to the east. Some main streets follow lines of canals, which still (now covered) traverse the city. The observatory stands 135 ft. above sea-level. The fortifications, converted into promenades, give the city an irregular pentagonal contour. Within are various open areas—the spacious Ippodromo, the public gardens, the Piazza Grande, and the Piazza Reale. The Via Aemilia passes obliquely through the city, from east to west.

Begun by Countess Matilda of Tuscany (1099), after designs of Lanfranc, and consecrated in 1184, the Romanesque cathedral (S. Geminiano) has a lofty crypt under the choir, three eastern apses, and a façade with sculptures of the 12th century. The graceful bell-tower, erected in 1224–1319, named La Ghirlandina from the bronze garland surrounding the weathercock, is 282 ft. high; in the basement may be seen the wooden bucket captured by the Modenese from the Bolognese in the affray at Zappolino (1325) (*see* Tassoni's *Secchia Rapita*). S. Giovanni Decollato contains a *Pieta* in painted terra-cotta by Guido Mazzoni (1450–1518). The so-called Pantheon Estense (the church of S. Agostino), is a baroque building by Bibbiena. San Pietro and San Francesco have terra-cottas by Begarelli (1498–1565).

The extensive ducal palace, from the designs of Avanzini (1651–1679), and finished by Francis Ferdinand V., with a fine courtyard, contains the military school. The Albergo delle Arti, built by Duke Francis III., accommodates the Museo Lapidario (Roman inscriptions, etc.); the valuable archives, the Biblioteca Estense, the Museo Civico, with palaeo-ethnological and archaeological collections; a collection of textile fabrics, and the picture gallery, presented to the city by Francis V. and since augmented by the Campori collection. The town hall dates from 1194. The university (783 students) is mainly medical and legal with a faculty of physical and mathematical science.

Commerce is chiefly agricultural. Modena is the point at which

the railway to Mantua and Verona diverges from that between Milan and Bologna, and has several branches to neighbouring places. It is also the starting-point of a once important road over the Apennines to Pistoia by the Abetone Pass, and of a canal by the Panaro and Po to the sea.

The old abbey of Nonantola (752) some 6 m. to the N. has a fine Romanesque church and valuable treasury and archives.

Modena is the ancient *Mutina* in the territory of the Boii, which became Roman in 215–212 B.C. The Roman town lay south-east of the modern; its north-western wall is marked by the Corso Umberto I.; but the Roman level is 15 to 20 ft. below the modern. Its territory was conterminous with that of Bononia and Regium, and to the south it extended to the summit of the Apennines. Marcus Brutus, lieutenant of Lepidus, held it against Pompeius in 78 B.C., and in 44 B.C. the place was successfully defended by D. Brutus against Mark Antony. The ravages of Attila and Lombard attacks ruined it, but about the close of the 9th century it was restored by its bishop, Ludovicus.

In the wars between Frederick II. and Gregory IX. it sided with the emperor. In 1288 Obizzo d'Este became its lord. Constituted a duchy in 1452 in favour of Borso d'Este, and enlarged and strengthened by Hercules II., it became the ducal residence on the incorporation of Ferrara with the States of the Church (1598). Francis III. (1698–1780) gave the city many public buildings. Hercules III. (1727–1803) saw his states transformed by the French into the Cispadine Republic, and died at Treviso. In 1814 his eldest son, Francis IV. received back the *Stati Estensi* and ruled them despotically. Francis Ferdinand V., succeeded in 1846, and on August 20, 1859, the representatives of Modena declared their territory part of the kingdom of Italy, and their decision was confirmed by the plebiscite of 1860.

MODERATOR, a judge or umpire, one who acts the part of mediator, and so a term used of the person chosen to be president of a meeting (as in America, of a town meeting). In the Universities both of Oxford and Cambridge, it is still used of the officers appointed to preside over certain examinations; but the best-known use of the word is in the Presbyterian churches; the name is applied to the minister elected to preside over ecclesiastical meetings or assemblies, as the synod, presbytery or general assembly (*see* PRESBYTERIANISM).

MODERN ARCHITECTURE, 18TH AND 19TH CENTURIES. This article deals with the development of architecture in Europe and America during the last two centuries prior to the general use of skeleton construction and design characteristic of it. (*See* ARCHITECTURE.) Certain European developments during the 18th century are also treated in this work in the articles BAROQUE ARCHITECTURE and RENAISSANCE ARCHITECTURE. Contemporary architecture is treated in this work under a number of headings which are given in the article ARCHITECTURAL ARTICLES.

CONTINENTAL EUROPE

Continental architecture from the end of the 15th to the beginning of the 19th century presents a continuous development on the lines of the Renaissance. But Renaissance is here used only for the first phase of the epoch, embracing about a century and a half. The ensuing stage, extending to the first decades of the 18th century, is termed *baroque*. The style of the following period is called *rococo*. From about 1770 the so-called *neo-classicism* dominates most European countries.

Development.—Architectural development from the time of the Renaissance takes very different forms in the different countries. This difference can be traced to the different character within each country of the Renaissance itself (*see* RENAISSANCE ARCHITECTURE). In Italy the Renaissance was never an established and defined style and it rapidly passes over to the daring expressive forms and the grandiosity of the baroque. In France, the style of the Renaissance, cultivated by academic tradition, pervades monumental French architecture right up to the time of Napoleon. Whereas in Italy the Renaissance is a direct reaction against the Gothic style, in France it stands in many ways as the heir of this style. The architecture of Spain also early acquired a characteristic style, which has never entirely disappeared. The Moorish influence allied itself easily and organically with the Gothic style and also became a welcome element in the baroque. The architecture of Central Europe is less determined in character. The ornamentation of the German Renaissance contains a seed of the turgidity of the baroque. North Germany is influenced by Holland, whose architecture adheres to the Italian Renaissance, especially as it has been developed by Palladio. Belgium stands under the influence of Spain, Italy, or France, each in turn. The architecture of the northern countries reflects their isolated position. In Denmark the Renaissance is dependent on Dutch, and in Sweden mostly on north German models. The latter country came into closer contact with the rest of Europe during the latter part of the 17th century and acquired a monumental architecture, which is specially allied to the Roman high Renaissance.

At the beginning of the 18th century Russia remained culturally and artistically isolated, the upper classes importing foreign—Italian, German or French—architects. (*See* RUSSIAN ARCHITECTURE.)

EIGHTEENTH CENTURY

In Italy the first phase of the 18th century is on the whole an echo of the 17th. A few characteristic buildings from this time, however, deserve mention: La Superga at Turin by Juvara (1685–1735), Fontana di Trevi in Rome by Salvi (1699–1751), and the façade of the Lateran basilica in Rome by Galilei (1691–1737). Galilei received his training in England and was obviously influenced by Wren. Italian architecture is already under the restraining influence of other countries.

During the 17th century France developed her academic classical style of buildings, which bears the name of Louis XIV. At the beginning of the 18th century comes a certain stagnation, although, during the whole of the century, France still sets the fashion for the rest of the Continent.

The changes of style, however, affect the exterior architecture —which on the whole still follows the academic pattern—less than the interior. The regency period marks a relaxation in the severe etiquette of Louis XIV. It aims at pleasantness, ease, and domestic comfort. The foremost French architects during this time are Oppenort (1672–1742) and de Cotte (1656–1735).

The Rococo Style with its peculiar ornamentation, developed from baroque and oriental—especially Chinese—art, has a typical exponent in Meissonier (1693–1750). Boffrand (1667–1754) is more refined, and in his private palaces, such as the Hôtel de Montmorency, he has created the ideal of a comfortable and distinctive dwelling. But although the rococo originated in France, it was of relatively short duration there, and its influence on architecture was limited. As early as 1732 signs of new ideals of style appear in the competition for the façade of the St. Sulpice church in Paris, in which Servandoni (1695–1766) carried off the prize with a project in "Palladio style" in competition with Meissonier's project in sumptuous rococo. It is significant that both of these men of extremes came from the Italian school

When the classicism of Servandoni made its appearance, it was a unique occurrence in French architecture and is perhaps, rather the expression of a theatre-painter's fantasy than the severe work of an architect. The struggle against the rococo style was soon in full swing, supported by such theorists as Blondel and Laugier. In 1737 Soufflot (1709–80) created an important building of classical inspiration—the Hôtel-Dieu in Lyons—and met with such success that he was called to Paris and entrusted with the building of the St. Geneviève church (Pantheon). This building, which testifies to a profound knowledge of Greek (Paestum) and Roman antique as well as of Italian high Renaissance, ushers in the eclecticism which prevailed in the 19th century. Ange Jacques Gabriel (1710–82) works more in conformity with French tradition in his buildings, such as the École militaire and Garde meubles (Place de la Concorde) in Paris, and in the Petit Trianon, near Versailles. Gabriel's interiors show the developed Louis XVI. style, and correspond, to a certain extent, to the English Adam style, but are more soft in their echo of the rococo.

In Germany, which long suffered from the consequences of the

devastating religious wars, the art of monumental architecture was developed later than in France. In the south, as well as in Austria, however, a lively building activity arose during the latter part of the 17th century. In Vienna and Salzburg Johan Bernhard Fischer von Erlach (1650–1723) created monumental buildings and churches, the most remarkable of which is the St. Karl Borromäus church in Vienna. In the pleasure palace of Belvedere in Vienna, erected for Prince Eugene, Johann Lukas von Hildebrandt (1666–1745) produced a work of art which exercised a deciding influence on Austrian and south German taste. A magnificent example of the Austrian baroque ecclesiastical architecture is the convent of Melk, built by Jakob Prandauer. The small St. Johann Nepomuk church in Munich, erected in 1733 by the brothers Asam, is an interesting example of the south German baroque. There is also the magnificently appointed residence for the Prince Bishop built by Johann Balthasar Neumann (1687–1753) at Wurzburg.

While the architecture of south Germany thus emanates from Italy, that of north Germany is dependent upon Dutch models. Building activity in north Germany was practically stagnant until the beginning of the 17th century, when the talented architect and sculptor Andreas Schlüter (1664–1714) was entrusted with the rebuilding of the royal castle in Berlin, a task continued by Johann Friedrich von Eosander (1670–1729). Prussia comes into close contact with French culture in the middle of the 17th century, and Georg Wenceslaus Knobelsdorf (1699–1753) was entrusted with the building of the city castle and the French church at Potsdam; the architecture of both is severely classical. During the latter part of the 18th century, French influence becomes more and more prominent in Germany. The so-called "Zopfstyle" appears as a mixture of French Louis XVI. and German baroque style. The most typical exponent of this early classicism is Carl von Gontard (1736–1802).

In the Netherlands artistic development came to a standstill after an extraordinarily flourishing period during the preceding centuries. As early as in the 18th century Holland developed in its churches that severe planning and sober appointments which have since become so common. Belgium came more and more under French influence during the 18th century, and therefore came under the influence of the French neo-classicism during the latter part of the century.

In Spain, at the beginning of the 18th century, Don José de Churriguera (1650–1723) developed the Spanish high baroque, with its sumptuous decoration and strange mixture of styles, which has been named *Churrigueresque* (*q.v.*).

Portugal during the 18th century concentrated its strength on a gigantic building, the Mafra castle, which, from an artistic point of view, however, does not justify the enormous cost of its erection.

Amongst the Scandinavian countries Sweden played a prominent rôle in the architectural history of the baroque period, especially through the activity of the Tessin family of architects. Nikodemus Tessin, the younger, created in the royal palace of Stockholm perhaps the most perfect building of the time emanating from the school of the Roman Renaissance. Later the Swedish art of building approached closer to French models.

NINETEENTH CENTURY

Politically the period of the French Revolution ushers into view a totally new epoch in the history of the Continent. The rupture is less evident in the history of art. Apparently the severe novantique, which characterizes the period following the Revolution, is a direct continuation of the classicism of the last phase of *l'ancien régime*. In reality, however, the Revolution introduced into this field also a totally new conception, which becomes ever more apparent during the 19th century. This is the eclecticism founded on archaeological studies. There is a fundamental difference between the conception of architecture of this new period and that of the Renaissance. Whilst the masters of the Renaissance and their successors gained inspiration for *new creation* from the classical architecture, the architecture of the 19th century is principally imitative and its highest aspiration is to come as close to the architectonic creations of past times as possible, but not to surpass or transpose them. This imitation is not limited to the antique only, but seeks its models amongst all the building styles of earlier times. The eagerness for archaeological research becomes wedded to romanticism, which in its literary enthusiasm for old times is blind to the requirements of the present day.

So far as architecture is concerned, therefore, the 19th century is full of interesting suggestions and experiments, but on the whole it is barren. A contribution during this century, however, which is decisive for the future, is the increasing development of the *technique* of building. By the middle of the century, iron made its appearance as a material with properties revolutionizing the art of building, and a short time thereafter came cement, a new and extremely easily worked building material; finally these materials were combined into reinforced concrete, a combination which seems to herald a complete revolution in architecture.

During this period the lead in architectural development on the Continent passed more and more from France to Central Europe. France, however, still retained her reputation as the keeper of the academic architectonic traditions, and in reality she still retained the lead at the beginning of the century. The architecture of the Napoleonic empire, or the so-called Empire style, is predominantly decorative in character. It does not aim in the first place at the solution of a certain practical building problem, but at the creation of a monument for the glorification of the empire. Just as Napoleon based his court ceremonials on Roman models, so these monuments seek to emulate the antique, whether they appear in the form of a "temple of glory," such as the Madeleine church, or as triumphal arches. However, in the latter erections and especially in l'Arc de Triomphe de l'Étoile by Jean François Chalgrin (1739–1810) can be traced the last appearance of the noble tradition of French classical architecture (Porte St. Denis by François Blondel, etc.).

The leading architects of the Napoleonic era and the architects mostly employed by the court were Charles Percier (1764–1838) and Pierre Fontaine (1762–1853). The works of these two collaborators show that they were influenced by the Adam brothers and, like them, they have made their works known in wide circles by their brilliant books of engravings. They have exercised a strong influence on the contemporary Continental taste especially by their designs for interior decoration and furniture. The style created by Percier and Fontaine rules in France on the whole up to the middle of the 19th century, but it is occasionally modified under the influence especially of Italian Renaissance, as shown by the St. Vincent-de-Paul church by Jacob Ignaz Hittorf (1792–1867).

The German nation was naturally qualified, by its peculiar combination of naïve eagerness for exact research work and dreamy enthusiasm, to acquire both the romanticism and the archaeological novantique. There appeared in the person of J. J. Winkelmann (1717–68) a—for that time—extraordinarily learned student of the history of antique art. Greek classicism was also soon developed in German architecture, and from the beginning of the 19th century received strong impulses. The Brandenburger Tor in Berlin by Karl Gotthard Langhans (1733–1808) is the most typical example of this severe classicism, and, in Karlsruhe, Freidrich Weinbrenner (1766–1826) created a number of artistically important buildings in the same spirit. Finally, Karl Friedrich Schinkel (1781–1841), a many-talented architect, transposed with uncommon independence and a rich imagination the classical ideals. His best known works are the royal theatre and the old museum in Berlin, the Niccolai church in Potsdam, and the Werder church in Berlin. With the last-mentioned building, Schinkel originated the new Gothic style, which afterwards became so popular in church architecture. South Germany possessed in Leo von Klenze a kindred spirit to Schinkel. The best known works by Klenze are the Glyptotheca and the Propylées in Munich and the Hermitage museum in St. Petersburg (Leningrad).

In the other countries of Europe the new classicism followed the development in the leading ones. Italian architects, as we have already pointed out, have been actively instrumental in bringing about the victory of classicism. The architect and engraver

8. Library in the Château Malmaison, France, 19th century. Percier and Fontaine, architects
9. Petit Trianon, Versailles, France, 18th century. Erected by Louis XV. for Madame Dubarry, and later a favourite residence of Marie Antoinette. The entrance façade is a typical example of the late French Renaissance style. Ange Jacques Gabriel, architect

Giov. Battista Piranesi (1720–78), with his excellent reproductions of the buildings of the antique and the Renaissance periods, has had a great influence on the direction of taste Giuseppe Valadièr (1762–1839) was active as an archaeologist and architect in a severe classical spirit during the Napoleonic era. At this time the building of theatres received an extraordinary amount of attention in Italy, Teatro della Scala in Milan by Giuseppe Piermarini (1734–1808) and Teatro St. Carlo in Naples by Antonio Niccolini being striking examples. The most characteristic ecclesiastical buildings of this time are the church in Possango by Antonio Selva (1753–1819), and the St. Francesco di Paolo in Naples by Pietro Bianchini.

During this time Denmark was artistically the leading country in Scandinavia and had excellent representatives in Christian Fredrik Hansen (1756–1845) and Michael Gottlieb Bindesböll (1800–56) of the refined, national new Danish classicism. Hansen's leading works were Christiansborg castle in Copenhagen (destroyed by fire) and Vor Frue church in Copenhagen. In Thorwaldsen's museum Bindesböll created an original and beautiful monument to the most celebrated sculptor of his time in northern Europe. The Dane Theophil Hansen (1813–91), who built the university in Athens and the house of parliament in Vienna, won international fame.

The Later 19th Century.—Continental architecture presents a varied picture during the latter part of the 19th century. The fashionable styles succeeded each other rapidly and academical architectonic education was mainly concentrated on imparting to the pupil an easy proficiency in the use of all these so-called "historical styles." This schematic doctrine of styles is the product of one-sided and to some extent imperfect knowledge of the history of architecture. Through its self-sufficient belief in its capability to judge what is right and suitable in each style, it has caused great and irreparable damage in the restoration of old buildings, a favourite occupation of the period.

The inability of the 19th century to solve its building problems in an independent manner is probably partly explained by the furious tempo at which building activity developed during this time. The larger towns especially grew with a speed hitherto undreamed of, and during the latter part of the century the problems of town planning therefore became acute. The 19th century did considerable preparatory work in this field, of which we are now enjoying the fruits. Many building problems arose which demanded an architecture of a totally different kind from the traditional. This was especially the case with industrial buildings, the great stores, railway stations, bridges, and skeleton buildings of many kinds. It is only in a few cases that the 19th century can show final solutions in these spheres, but by zealous experiments the way was nevertheless prepared for a new and more homogeneous art of building. At the exhibitions, which were so usual in this century, there was a great predilection for the new technical creations, and these exhibitions have therefore given interesting examples of what technique has been able to accomplish at different times.

Only a few of the great number of architects active during this time can be mentioned here. France has in Viollet-le-Duc (1814–79) a prominent representative of the scientific art of restoration, who occupies a leading position on the Continent. Charles Granier (1825–98) created a sumptuous edifice in the great opera house in Paris, which aroused enormous admiration amongst contemporaries. The Eiffel tower, erected by Gustave Eiffel for the Paris exhibition in 1889, has met with more criticism but has perhaps exercised a deeper influence on subsequent architecture. Germany has a refined and independent architect in Gottfried Semper (1803–79), who works in the spirit of the Renaissance. Alfred Messel (1853–1910) shows in his buildings, such as Wertheim's stores in Berlin, a free adaptation of historical styles to modern purposes. In Italy—roused to new life by her political independence—a lively building activity was developed during the latter part of the 19th century. The Galleria Vittorio Emanuele by Giuseppe Mengoni (1820–77) is a characteristic example of the generously planned Italian building projects. At the turn of the century representatives appeared in Austria, Holland and Switzerland of new tendencies, which, however, were not fully developed until the 20th century. Denmark still retained its leading position amongst the Scandinavian countries. This country, by maintaining a sound and moderate tradition, forms a point of departure for the national re-creation of architecture which is taking place in the northern countries at the beginning of the 20th century. The town hall in Copenhagen by Martin Nyrop (1849–1921) is the best example of this style.

ENGLAND

The architecture of England during the 18th century covers a longer period than commonly supposed. It begins with the school of Sir Christopher Wren and his contemporaries (*see* RENAISSANCE ARCHITECTURE) and extends to the period of the Regency. Resting upon the broad foundation prepared in the late 17th century it became subject to many external influences but in general remained constant to the classicism of the age. The classic viewpoint may be said to have dominated all the arts and to this cause can be attributed the remarkable consistency of style which is the chief characteristic of the buildings of the time. Between the years 1700–1800 the population increased from five to eleven millions, steam-power was harnessed and commerce was almost quadrupled. The impetus given to architecture began with the Revolution of 1688, when direct governance fell into the hands of the Whig Party. From thence onwards statesmanship became more closely allied with commercial advantage, the nation changed its chief industry from agriculture to manufacture and a redistribution of the people was in progress. Throughout the period architects appear to have expressed the new conditions with due regard to the spirit of the age. Broadly speaking the buildings group into two main divisions, *i.e.*, monumental and domestic. In the main the tendencies were academic, and were related to similar impulses then in action on the Continent. English architecture, however, developed its own characteristics. The architects were continually seeking fresh inspiration from Italy and, at a later date, Greece. While this is true of the monumental aspect of certain buildings, the repose which is the chief attribute of the domestic architecture can be traced more directly to the Anglo-Dutch tradition instituted by Wren. In addition, craftsmanship based upon mediaeval practice, and the persistence of regional traits, gave added piquancy to the vernacular style. It was not until the close of the first quarter of the 19th century that the old system began to be crushed out. On the monumental side the completion of St. Paul's cathedral and Greenwich hospital in the reign of Queen Anne, and the building of several new churches, terminated the immediate influence of Wren and Hawksmoor. Then ensued a transference of architectural energy to the erection of princely mansions in town and country expressing the sound status of the leaders among the Whig Party.

Sir John Vanbrugh, famed as a dramatic author, now came into prominence as an architect. To his care had been entrusted the naval buildings at Plymouth dock. He found further scope for his theories of vast scale at Castle Howard, Blenheim palace and Seaton Delaval. Vanbrugh was influenced not only by the work of Sir Christopher Wren but by contemporary French work, and the designs of Daniel Marot. His pupil Thomas Archer created St. Philip, Birmingham, and the temple at Wrest park, Bedfordshire. Vanbrugh forms the chief link between the school of Wren and the coterie of early 18th century architects who favoured the style of Palladio, and the revival of the style initiated in the previous century by Inigo Jones. James Gibbs is another link. In this case the Palladian influence is carried on to the work of

Sir William Chambers. Gibbs is renowned for the church of St. Martin-in-the-Fields and the Radcliffe library at Oxford, as well as for country and town houses. By the year 1730, building on the great scale had definitely turned to Palladian and Roman doctrines. William Kent was engaged on Holkham hall, Norfolk, and Devonshire house, London. The amateur had entered the lists, and the earl of Burlington was looked upon as the chief patron of the arts. The extent of the revived Palladian movement can be judged from the character of the villa at Chiswick (1729, a modification of the Villa Capra, Vicenza), Mereworth castle, Kent, Houghton hall, Norfolk (the seat of Sir Robert Walpole), and Prior park, Bath, by John Wood.

The fashion of the "Grand Tour" and the acquisition of antique statuary both contributed to the passion for authentic classicism, and it was not long before architects followed in the steps of the rich patrons to Rome. Henceforword two factors determined the status of an architect, *i.e.*, travel in Italy and the publication of a work on architecture. The folio works edited by Leoni, Ware, Gibbs and Chambers had the immediate effect of reducing architectural design to a mere repetition of rules. Another influence was the founding of the Society of Dilettanti which resulted in the extension of classical research to Greece. While the building of great palaces belongs more especially to the first half of the century, the practice was continued to the end of the period. In the works of Sir Robert Taylor, Robert and James Adam, Sir William Chambers and Carr of York is evidenced an extension of private palace building on a diminished scale. In this regard the Palladian type can be regarded as dominant.

Types of Buildings.—The social conditions of the period are reflected in the development of town planning (*see* Town and City Planning), more especially in the Squares of London, the stately streets of Bath and the New Town of Edinburgh. Although the bulk of early 18th century architecture consisted of private mansions there was also scope for new types of public buildings (*see* Governmental Architecture), of which in London the Bank of England, designed by Sampson and later remodelled by Sir Robert Taylor and Sir John Soane, was the chief. Other official buildings include the Mansion house, by Dance the Elder; the Admiralty, Whitehall, by Ripley; the Horseguards, by Kent; and South Sea house. In various cities outside London town halls were built, as at Liverpool (1754) by John Wood, Bristol, Doncaster, Warwick and Salisbury. The Georgian theory of civics included hospitals such as St. Bartholomew's, by James Gibbs, St. Luke's by George Dance the younger, prisons such as Newgate, guildhalls and lawcourts. The principal Government buildings were erected in the second half of the century. The exponent of the matured Roman Palladian style was Sir William Chambers, a worthy associate of Reynolds and Dr. Johnson. The design of Somerset house ranks among the first works of the second half of the period in London. For this building Chambers evolved a majestic river frontage rising by terraces direct from the water line. The detail shows the influence of contemporary French taste, particularly the works of Neufforge and Gabriel. Broadly speaking the work of James Gibbs can be regarded as the basis upon which the Chambers manner was modelled. Robert Adam, in collaboration with his brother James, contributed an elegant rendering of classical detail for his graceful designs, but by contrast with the works of Sir William Chambers the buildings he erected are effeminate. In the hands of Carr of York, James Gandon and Harrison of Chester the Roman Palladian expression was continued. Dublin owes its monumental buildings chiefly to Gandon. These latter include the Customs house, the Four Courts and the Kings Inns. Following the leading architects a host of lesser men were adding to the pronounced classicality. Architectural taste was influenced by the publication of folio volumes of designs, Builders' Guides, and other works related to architecture, which had the beneficial effect of restraining eccentricity. The whole tendency towards standardization exactly suited the requirements of the time.

Decline of Palladianism.—Towards the close of the century the Roman Palladian school showed signs of abating interest. True, its principles had been vindicated by the younger Dance in the design of Newgate, but newer forces were becoming active. Architects and patrons now took notice of Greek detail and paid attention to "Stuarts Athens." The Brothers Adam had already exploited Greek detail, for stucco enrichments, but it was left to Henry Holland to imitate a formal Graeco-Roman manner. The most original designer, however, was Sir John Soane. Soane began by following the work of the Adam brothers; he had been employed in the offices of Dance and Holland; later, acting on the advice of Sir William Chambers, he gave attention to the designs of Piranesi. When Soane was commissioned to rebuild the Bank of England he revolutionized the older school of thought by evolving detail for which there was no precedent.

Reviewing the monumental character of English architecture, from the period of Vanbrugh to that of Soane, it becomes clear that the academic issues had been taken to a point beyond which it was impossible to go. At the end of the 18th century the modern spirit was in the ascendant. The example of the French Revolution, the rise of trade and the emergence of a vigorous middle class, pointed the way to vaster developments. Soane had almost prophetic vision, and he became professor of architecture at the Royal academy, training many private pupils. In the first quarter of the 19th century there ensued a further merging of Palladian tendencies with Greek detail. The "metropolitan improvements," engineered by John Nash and the Committee of Taste, were for the most part stuccoed conventions.

NINETEENTH CENTURY

The 19th century from first to last was a period of style exploitation and pictorial experiment. The reason for the change is associated with the enormous development of manufactures. At the close of the reign of George IV. the country had passed from agriculture to intensive industry. Town life formed a magnet denuding the country-side of its rural population. The middle classes had become firmly established and participated in national affairs. The problems of housing and cheap food were foremost. It is not surprising, therefore, that the traditional handicrafts lost caste. The new economic conditions demanded mass production, the old values deteriorated, and revivals of historical styles became inevitable. The growth of cities, seaports and manufacturing centres, called for buildings of complex character. The administration of the country required public edifices (*see* Governmental Architecture), education needed schools, religion appealed for new churches and conventicles (*see* Religious and Memorial Architecture). Civil engineering, at first associated with docks, highways and railroads, led to the rise of a coterie of engineers, among whom Rennie and Telford were prominent.

From 1800 to 1830 the art of architecture in many particulars fulfilled the moods of the late 18th century. There was an extension of the Greek school, which had been adumbrated as early as 1770. But the ambitions of the classicists, who had developed a bias towards academic Greek, were in process of being checked by the romantic group, who favoured revived Gothic. Although the "battle of the styles" was never brought to a conclusion, classic remained in the ascendant. On the classic side the stimulus of Greek, Roman and Italian motives continued almost *pari passu* with the revival of English and French Gothic. At the time of the Great Exhibition of 1851 the divisioning was definite. On this showing one aspect of early Victorian art can be traced to the influences in vogue at the time of the Regency. After 1851 the classic school had recourse to emulation of contemporary French Neo-Grec, to imitation of old Italian models and later to revivals of the domestic architecture current in the reigns of Queen Elizabeth and Queen Anne. The interest aroused in 18th century social life, especially by the writings of Thackeray, foreshadowed the Georgian revival characteristic of the last decade of the 19th century. Little more than 50 years separates the "artistic '80s" from the period of the "metropolitan improvements" which were the triumph of Nash and the Committee of Taste. From 1840 onwards the development of lithography, engraving and photography made familiar to all classes the pictorial qualities of historical architecture.

Steel and Tradition.—Among the Victorian architects the

Dorchester House, Park Lane, London (1851), Lewis Vulliamy, arch't

aim was to compete with the masterpieces of the past and to reconcile the age of steel with the time honoured styles. The use of cast iron and steel as a basis for construction enabled greater spans to be attempted. Such frameworks gave scope to engineers, and called for ingenious veneerings of historical detail. Apart from the Crystal palace, and the iron and glass vaults over railway stations, the result was one-sided. The feverish craze for pictorial accomplishment obscured the benefits of structural statement. So far as monumental and civic buildings were concerned architects based their projects upon Greek, Roman and Italian prototypes. The exponents of Greek were H. W. Inwood. who designed St. Pancras Church, London, to include features from the Erectheum and the Tower of the Winds; William Wilkins, who contributed University college, London; Sir Robert Smirke, who designed the British Museum, and the post office; and Decimus Burton, who designed the screen at Hyde park corner, and the Athenaeum club. George Basevi favoured the Graeco-Roman style, his chief work being the Fitzwilliam Museum, Cambridge. The finest classic building of the first half of the century, St. George's hall, Liverpool, was erected by Harvey Lonsdale Elmes; this building, conceived on Graeco-Roman lines, owes its detail to the skill of Professor C. R. Cockerell.

Neo-Grec.—By the year 1850, more enlightened theories were in the ascendant; it was realized that neither academic Roman nor Greek entirely suited civic art. Fresh inspiration came from the Neo-Grec revival which was being pursued in France, under the leadership of Louis Duc, and Labrouste, and in Germany under Schinkel. As a style neo-grec found a worthy exponent in Prof. Cockerell, whose researches in Greece and Italy fitted him to combine academic knowledge with respect for the works of Wren and the whole gamut of the English classical tradition. Cockerell's buildings include the Taylor Institution, Oxford, the Sun Fire Office, London, branches of the Bank of England at Liverpool, Manchester, Bristol and Plymouth, and the remodelling of Soane's attic storey to the Bank of England in Threadneedle street.

Italianate.—Another section of the classic school entered upon an Italianate phase. For example Sir Charles Barry favoured astylar façades. His designs for the Travellers club, the Reform club and Bridgewater house, London, were thought to be admirably suited to their several purposes. Other exponents of the Italian school were Sir James Pennethorne, Philip Hardwick and Sir Gilbert Scott. This coterie designed, respectively, the Geological museum, London, the Great Hall at Euston station, London, and the Government offices, Whitehall, London, comprising the home, colonial, foreign and India offices. Another Italianate building, Dorchester house, London, designed by Lewis Vulliamy, as frankly a copy of the Villa Farnesina, Rome; much of the interior decoration was contributed by Alfred Stevens.

Later Developments.—In the second half of the 19th century the development of commerce demanded newer types of warehouses, banks, assurance offices and town halls. As a result the Italian style gained fame. Two other buildings remain to be considered; *i.e.*, the Science college, South Kensington, and the Albert hall, London. These buildings, conjointly the work of Capt. Fowke, Gen. Scott and various architectural assistants, are good examples of ordered but free classic. In the work of "Greek" Thomson and Hibbert of Preston, there is evidence of a later revival of Neo-Grec. A freer version of monumental classic begins with the work of Norman Shaw, James Brydon, John Belcher and Sir Reginald Blomfield. From thence to the present time the tendency has been towards classical scholarship combined with invention. In this the influence of the Ecole des Beaux Arts (*see* ARCHITECTURAL EDUCATION), is paramount.

The Gothic Revival.—The beginnings of revived Gothic can be traced to the 18th century. The founding of the Society of Antiquaries, the monthly periodical magazines and the curious taste of Horace Walpole at Strawberry Hill prepared the way for Fenthill and the remodelling of Windsor castle. In the late 18th century many cathedrals and churches became the subject of churchwarden repair. From 1800 onwards the subject of mediaeval art forms the background of fashionable novels; Jane Austen touches upon Gothic art in *Northanger Abbey*, and later Sir Walter Scott, Goethe and Victor Hugo made the subject popular. The mediaeval movement also found support at the hands of the Church. As a result, by the middle of the 19th century, there ensued a phase of church restoration and building based upon an analytical study of authentic examples of Gothic Architecture.

The subject of Gothic art also claimed exponents among the acknowledged leaders of the classic school. For example, Professor Cockerell designed Lampeter college, and Sir Charles Barry, beginning with Birmingham grammar school (1833) gave Gothic verticality to the classic plan of the palace at Westminster. In this design Barry was assisted by Augustus Pugin whose extraordinary knowledge of Gothic detail was unrivalled. Indeed, Pugin, who held almost fanatical views on the subject of what he termed the "Christian" style, was the moving spirit in the Gothic revival. His own work included 65 churches in the United Kingdom. His chief work is St. Georges cathedral, Southwark. Philip Hardwick, whose fame rests upon the classic hall at Euston station, was responsible for the eminently successful hall and library at Lincolns Inn. Both Sir Charles Barry and Philip Hardwick favoured a modern version of Tudor Gothic; other revivalist architects at the time concentrated upon Early English or Decorated Gothic (*see* GOTHIC ARCHITECTURE). The work of Sir Gilbert Scott covers the period 1846–77; he built St. Giles, Camberwell; St. Mary Abbotts, Kensington; St. Mary's cathedral, Edinburgh; St. Pancras station, London; Glasgow university and many other large buildings. He was concerned with the restoration of many old churches, and has been censured for the design of the Albert memorial. William Butterfield and W. Burgess gave their attention to colour, and sought to modernize the Gothic spirit. Burgess designed his own dwelling, Tower House, Melbury road, Kensington; and he left innumerable designs for furniture. In the career of G. E. Street is evidenced the ultimate phase of the revivalist movement; the Royal Courts of Justice, London, 1874–82, rank as the last attempt to apply Gothic to a great public building; Street was conversant with Continental Gothic, and although he was cramped by an awkward site in Fleet street, and suffered interference from the lawyers, he overcame many difficulties. The work of John Loughborough Pearson is exemplified in the following London churches: St. John, Red Lion Square; St. Augustine, Kilburn; and the Catholic Apostolic church, Maida Hill; in addition to extensive repairs at Westminster abbey, Pearson designed Truro cathedral, a building which suffers from diminutive scale but whose details are faultless.

Out of the ruck of revivalism the practice of Gothic art emerged into a clarified atmosphere. A new coterie consisting of James Brooks, G. Gilbert Scott, J. Oldrid Scott, G. F. Bodley, John Bently and Sir Arthur Blomfield, became responsible for a series of churches and college additions of great merit. Even towards the close of the 19th century revived Gothic had not lost caste. At the hands of J. D. Sedding, H. W. Wilin and Leonard Stokes, the tradition was continued with varying success. The new Cathedral at Liverpool by Sir Giles Gilbert Scott is to be considered a fitting climax to the Gothic movement. This building, begun in 1903, is remarkable for its masterly plan and monumental character. The great double transepts, the mighty scale and the simple detail, contrasted with the beauty of the Lady Chapel, form an ensemble exactly suited to the magnificent site.

AMERICA

On the founding of the British colonies in the wilderness of North America the first dwellings were like the "frail houses," made of wattle, clay and thatch, which still sheltered the farm labourers and copyholders in England. The first church at Jamestown was "set upon cratchets"—forked sticks set in the ground —"covered with rafts, sedge and earth." Such primitive shelters were the "English wigwams" of early chroniclers, by no means like those of the Indians. At Plymouth and elsewhere, lines of stakes or hewn planks were driven into the ground to make "palisaded houses." The log-house, of horizontal logs notched together at the corners and chinked with clay, was unknown in England, and was brought in by the Swedes of the Delaware, to whom it had been the ordinary form of dwelling at home. Its suitability to conditions in the densely forested new country soon led to its adoption by the English colonists, and it later became the typical form of frontier dwelling.

Meanwhile, soon after the first settlement, the building of frame houses had begun, few at first, for the leaders. The filling of the "half-timber" frames with wattle or cat-and-clay was soon found inadequate to withstand the severe climate, and was covered with weather boards, as used in Kent. Thirty years after the settlement the ordinary farmer or artisan had such a house of a single room below, a storey and a half in height; the divine or magistrate, one of two storeys and a half, with two rooms to a floor, and often with a "lean-to" extension at the rear. Glass windows now became common, chimneys of masonry replaced those of clay, and shingle roofs rapidly took the place of thatch. The general dearth of lime made it difficult to build with brick or stone, and these were but gradually adopted, except in Pennsylvania, where lime and a fine ledge stone were both abundant.

The artistic character of the 17th century buildings in America remained that of rural England at the time the colonists left, a simple Jacobean style in which mediaeval survivals predominated. Steep gabled roofs, leaded casement windows, high, clustered chimney stacks and exposed construction are characteristic elements of the effect. In the more elaborate wooden houses of New England, the upper storeys often overhung the lower, as in the old English houses of timber. Among the finest examples surviving are the House of the Seven Gables in Salem and the Parson Capen house (1684) in Topsfield, Mass. In the early plantation houses of Virginia there were more ambitious attempts at a Jacobean character: Bacon's Castle (before 1676) with cross-shaped plan and with curved and stepped gables; Fairfield (now destroyed) with the H plan traditional in England under Elizabeth and James I.

In the South, loyal to the Established Church, the churches continued the type of late Gothic English parish church with a square tower at the west. The earliest of them, at Jamestown and Smithfield, still had projecting buttresses and traceried windows. In New England the Puritan meeting-house followed the scheme of the dissenting chapel, with pulpit on one of the long sides, galleries around the other three. They were of the utmost plainness, strongly framed, with roof on curved braces, as we see in the "Old Ship" at Hingham, Massachusetts.

Eighteenth Century.—The opening of the 18th century brought the adoption of the forms of academic architecture, introduced in England by Jones and Wren (*see* RENAISSANCE ARCHITECTURE). While retired farmhouses still kept the high gable and other features surviving from the middle ages, the houses of leaders such as Keith and Logan in Pennsylvania, Hancock in Boston, or William Byrd in Virginia showed the classic cornice, the mantelpiece framed by mouldings or the adornment of doorways by the classic orders. The abundant forms of the Baroque (*see* BAROQUE ARCHITECTURE) appeared in the scrolls of the pediments which crowned doorway and overmantel, while the classic spirit of order and repose brought in the balanced plan and the continuous horizontal cornice all about the lowered roofs. At first there was great simplicity in the wall surfaces, which relied only on uniformity, proportion and the fine texture of brick, ledge-stone, clapboard or shingle.

By the middle of the century there was some attempt at more monumental treatment, even in the house. Tall pilasters marked the corners and the centres, or stood all about. In a few houses on the eve of the Revolution—Drayton's Palace and the Brewton House in Carolina, Monticello, the home of Jefferson, and Lansdowne, that of Gov. John Penn—storeyed porticos rose one above another at the front.

This trend toward a modest grandeur was more clearly evident in the churches. Those of the Church of England in the colonial capitals, like St. Philip's and St. Michael's in Charleston, Christ church in Philadelphia and King's chapel in Boston. These had columned interiors and steeples like those of Wren's churches in London; some even had the great external portico brought in by Gibbs' St. Martin in the Fields.

With the increasing power of the colonial assemblies, public buildings began to assume importance and pretentions. Independence hall, the old Pennsylvania State house, stands as the type of the earlier ones, still half-domestic in character. The painter Smibert in Faneuil hall at Boston and the gentleman-amateur Peter Harrison in the town hall at Newport, with their arched and pilastered fronts, set new standards of conformity to the old world.

In the domestic interiors (*see* INTERIOR DECORATION) just before the Revolution the Chippendale vogue brought in the *rocaille* ornament of Louis XV., appearing in the carving of chimney-pieces, the ornamentation of plaster ceilings with delicate leafage and tattered shell, as at the Phillipse Manor in Yonkers, at Westover on the James River and elsewhere.

These were mansions in which the ideal was conformity to current English usage, and the achievement was comparable to that of the smaller houses of gentlemen in the English shires. Far more racily American were the provincial types of the byroads, lagging behind the march of progress. The wooden New England farmhouse with its roof extended to the northern storms by a long lean-to and rambling sheds, the "Dutch colonial" type about New York with low gambrel roof and wide overhanging eves; the Pennsylvania houses of stone, hooded, perhaps, above the lower storey, the cottages of rural Virginia with their tall chimneys and detached outbuildings, are vernacular or dialect types purely American in their development.

More distinct still are the stone houses of the French in Quebec, the stuccoed and whitewashed walls of the few Spanish buildings in Florida, the French and Spanish buildings of Louisiana, with their formal ordonnance, the Spanish missions of the south-west. Here, after beginning with structures of the simplest adobe, the Jesuits brought in, at the missions of San Antonio, some of the fire of Churriguerra; the Franciscans of California carried on a chastened Spanish tradition into the 19th century.

The Revolution brought new problems and new ideals. A new type of legislative building was to be created; institutional buildings had to be reformed in accordance with democratic and humanitarian principles. There was the wish to throw off provincial dependence on British style, yet to retain the respect of foreign observers. Jefferson (1743–1826) established the new artistic direction when, long before Napoleon's Madeleine, he chose the Maison Carrée as the model for the Virginia capitol (1785). The architecture of the early Republic was turned into a classical and monumental channel. In building the new city of Washington (1791 ff.) for the Federal Government great efforts were made to surpass the colonial capitals. L'Enfant (1754–1825), a French engineer, laid out the town on suggestions from Versailles, Hallet, a French architect of the highest professional training, created the type of modern legislative building with wings for the two chambers and with a tall central dome. Hoban (*c.* 1762–1831) an Irish master-builder, modelled the president's house, the White House, on the great British Georgian mansions, and Jefferson gave it, during his presidency, the tall circular portico to the river. In New York Mangin, another Frenchman, gave the design for the City Hall (1803–12) a work purely Gallic; in Boston, Bulfinch (1763–1844), a native amateur, soon to become professional, suggested the fronts of the Place de la Concorde beneath the dome of his

6. Trinity Church, Copley Square, Boston, 1872–77. H. H. Richardson, architect

State house (*see* Governmental Architecture).

In domestic architecture the modern comfort invented under Louis XV. came in at the same time with the classic style. The oval salon *à la française* was adopted in the White House and the homes of many leaders in politics and fashion. In the North it was the delicate Adam versions of classical ornament which prevailed in the houses of Bulfinch, McIntire, McComb and Thornton; south of the Potomac the monumental portico sponsored by Jefferson at Monticello and the University of Virginia (1817–1825) adorned the great houses of the Piedmont.

Greek Revival.—The Greek revival came hard on the heels of the Roman. The leader was Benjamin Henry Latrobe (1766–1820) who had learned his Greek details in England but got his stimulus toward bodily imitation of the temple from the American laymen and amateurs, now filled with a sophomoric enthusiasm for antiquity. His Bank of Pennsylvania (1799) was the beginning, his Bank of the United States (1819–24), now the Philadelphia Custom House, an imitation of the Parthenon, was the culmination of the movement. His pupils Mills and Strickland rang the changes on the classical motives, as in Mills' great colonnade of the Treasury, and his Washington monuments in Baltimore (1815 ff.) and Washington (1836 ff.), a great Doric column (antedating the similar monuments abroad) and a vast obelisk. Churches and houses likewise followed the type of the temple, which became a single unconditional ideal for all classes of buildings. The white porticos rose alike in the whaling ports of New England, on the banks of the Delaware, the Potomac and the distant Ohio, and on the borders of the Great Lakes and the Gulf. Their tradition lingered until the Civil War.

Gothic Revival.—In the '30s it was already beginning to be undermined by the growth of romanticism. Jefferson and Latrobe had already toyed with the Gothic as an alternative. Downing, the landscape gardener, and Davis, his architect collaborator, used it with greater conviction. Newcomers from England like Richard Upjohn (1802–1878) designer of Trinity church in New York, brought a new knowledge and competence. The enthusiasm of Ruskin made a Victorian Gothic universal in churches, and drew civil architecture into the Gothic orbit. Later disciples of romanticism like Cram and Goodhue added the element of craftsmanship, on the stimulus of William Morris.

Eclecticism.—Meanwhile the widening historical horizon had evoked in America, as in Europe, a general eclecticism, a choice of many styles but half understood. The brilliance of the Second Empire gave vogue to the mansard roof; the influx of the Germans brought the floridity of the northern Renaissance; the Centennial Exposition, the English Queen Anne. For a moment in the '80s Henry Hobson Richardson (1838–1886) carried all before him with his free and virile version of southern Romanesque, first embodied in Trinity Church in Boston. Richard Morris Hunt (1827–1895), who had led the way to study at the École des Beaux Arts, introduced its system of instruction (*see* Architectural Education), and adopted the style of the Valois châteaux in his great Fifth avenue houses and country palaces, like Biltmore, N.C., for the new American plutocracy. While suggestions from early American buildings were taken up by McKim and others who inaugurated a Colonial revival, and the local traditions of Florida suggested to Carrère and Hastings a Spanish style, many of the students returning from Paris remained faithful to the style of the Louis.

Steel.—In the midst of these historical reminiscences science and industrialism were evoking new materials and modes of construction. The fruitful exploitation of iron came, along with the elevator, in the high office buildings, which the absence of legal restrictions allowed to rise on the preferred urban sites. At first these were amorphous structures of self-supporting external masonry walls, interior columns of cast iron, and beams of rolled iron, as in that of *The World* in New York, over 300 ft. As they grew higher and higher, the thickening of the walls compromised the rental value of the lower storeys. In the Home Insurance building designed by William LeBaron Jenny in Chicago in 1883, the idea came of supporting the walls, as well as the floors, on the frame. Soon the structural type was crystallized by the adoption of a steel frame, riveted throughout. The last hindrance to ascent was swept away, the skyscraper appeared. (*See* Architecture.)

The idea of finding in this new structural development the key to a new and modern style grew out of the rationalistic architectural theory of Viollet-le-Duc and Semper. It was Louis Sullivan (1856–1924), of Chicago, who had the creative imagination to clothe the steel frame of the high building in new functional form. Its loftiness he accented by vertical lines replacing the old wall surfaces of masonry. His Wainwright building in St. Louis, designed in 1890, was the manifesto of a new school, and had an influence far beyond his own partisans.

Neo-classicism.—Against Sullivan's equation of beauty with truth, his structural emphasis, the New Yorkers led by Charles Follen McKim (1847–1909) and Stanford White (1853–1906) sought to re-establish the independence of art through abstract beauty of form. Like worshippers of form in many earlier periods, they turned again to the Roman alphabet, but their work is not to be regarded merely as one more historical revival among many. They reaffirmed a unity of style, as well as a unity in the single work, ignoring the temptation to characterize and differentiate minor elements. The long unbroken fronts of McKim's Boston library (designed in 1888), with its uniform arcades, was the first work in this vein to seize public attention.

The cohorts of function and of form met on the battlefield of the Chicago World's Fair in 1893. The Westerners, with one exception lost themselves in a variety of historical reminiscences. Sullivan, in his Transportation building, glowing with colour and gold, sought to create a new expressive idiom of detail and ornament, but he stood alone. The Eastern men made common cause in unifying their buildings about the Court of Honour. The sheds of steel and wood disappeared behind ordered white colonnades whose justification lay only in their own harmony. The cumulative effect was overwhelming, and was deeply branded on the memory of the nation.

In the remaining years of the decade its whole architecture turned again to classic unity of form, finding a sanction in the works from the formative period of the Republic. The great formal groups for Columbia and New York universities, dominated by their domed libraries, recalled Jefferson's initiative at the University of Virginia. The banks reverted to the models of Latrobe; the triumphal arch and column were revived as types of monuments. Domestic architecture followed Colonial or Italian suggestions, with gardens (*see* Landscape Architecture) once more formal in design. With the plans for the improvement of Washington, developing the neglected conceptions of L'Enfant, at the turn of the century, the artistic ideals of the founders were re-established. (For current work *see* Architecture.)

Bibliography.—Books concerned with the whole history of American architecture are: L. Mumford, *Sticks and Stones* (1924); T. F. Hamlin, *The American Spirit in Architecture* (1926); T. E. Tallmadge, *The Story of Architecture in America* (1927); F. Kimball, *American Architecture* with full bibliography (1928). For the earlier period *see* W. R. Ware, ed., *The Georgian Period* (Boston, 1898–1902); A. Embury, *Early American Churches* (New York, 1914); F. Kimball, *Domestic Architecture of the American Colonies* (New York, 1922). For the contemporary period *see* J. Gréber's *L'architecture aux États-Unis* (1920); W. Hegemann and E. Peets, *American Vitruvius* (1920), and G. H. Edgell, *American Architecture of To-day* (1928).

(F. Ki.)

MODERNISM. This term has been used since the second decade of the twentieth century (at least as early as 1914) to describe the form which the Broad Church or Liberal Church Movement has taken in the Church of England. The word Modernism had been used on the Continent during the pontificate of Leo XIII. as the designation of a neo-scholastic movement in the Roman Catholic Church which was condemned by the Encyclical *Pascendi* in 1907. The English movement, although in its philosophy and theology it differs widely from Roman Modernism, yet has affinities with it both in its causes and aim, and has been influenced in some measure by such Roman Catholic Modernist writers as George Tyrrell, F. von Hügel and Alfred Loisy. For instance English Modernists have no difficulty in accepting for themselves Tyrrell's description of Modernism:

"I think that the best description of Modernism is that it is the desire and effort to find a new theological synthesis, consistent with the data of historico-critical research. . . . By a Modernist I mean a churchman of any sort who believes in the possibility of a synthesis between the essential truth of his religion and the essential truth of modernity."

The following accounts of it by five writers intimately connected with the activities of the English Modernist Movement present it fairly:

"Modernism is based upon evolution in science and the critical method in history: and it demands, not that the great truths of the Christian religion shall be given up, but that they shall be considered afresh in the light of growing knowledge, and re-stated in a way suitable to the intellectual conditions of the age."

"Modernism seeks to combine in a higher unity the two ways of looking at Christian history, the evolutional and the inspirational." (Professor Percy Gardner.)

"Modernism is the attempt of the modern spirit, acting religiously, to refashion Christianity, not outside, but inside, the warm limits of the ancient churches, to secure not a reduced, but a transformed Christianity." (Mrs. Humphry Ward.)

"I do not disclaim the term Modernist. The name describes justly what I aim at being. I aim at thinking the thoughts and speaking the language of my own day, and yet, at the same time, keeping all that is essential in the religion of the past." (Canon William Sanday.)

"Modernism is only the altogether praiseworthy attempt on the part of a group of thinkers to present Christian truth in terms of modern knowledge. We do not to-day travel by coach, or wear jerkins, or speak the language of Chaucer, or believe that the earth is the centre of the solar system. Why in matters theological should we be forced to think in terms of bygone centuries? Woe betide the Church that shuts its eye to God's gift of new knowledge." (Canon Vernon Storr.)

"Modernism is not a religion: it is a defence of religion, and of the Christian Religion." (Dr. R. W. Macan.)

The enormous advances made, not only in natural and physical science during the last seventy years, but in literary and historical criticism of the Bible, the history and psychology of religion, anthropology and history, have rendered much of the traditional Christian doctrine untrue in its form, but some of it also untrue in fact. English Modernists, who believe in the essential truth of the Christian Religion and in the indispensable services which the Christian Church, the historic *organon* of that religion, can perform in the spheres of both personal culture and social evolution, desire to win the Church authorities to the difficult and courageous policy of openly rejecting false tradition, however venerable, and discarding ancient formulae, where repugnant to modern thought and feeling, in favour of teaching which seeks to express the truth of fact and faith in harmony with modern knowledge, conviction, and aspiration.

The Modernist regards his task as twofold:—

(1) The presentation of essential Christian truth in the light of modern knowledge and in such a way that it does not conflict with it:

(2) The conversion of the authorities and adherents of the Church to the acceptance, authorization and propagation of Christian doctrine in this new form.

Bishop Barnes F.R.S. has hailed Professor F. J. A. Hort of Cambridge as "the Father of English Modernism." In that case he was its posthumous father as it is only in the Appendix to his *Hulsean Lectures* published in 1893, after his death, that his Modernism is clearly seen. Hort there affirms that

"Christianity is not a uniform and monotonous tradition, but is to be learnt by the successive steps of life." "Criticism is not dangerous save when it is merely the tool for reaching a result, believed on the ground of speculative postulates."

"There can be no surer sign of decrepitude and decay in faith than a prevalent nervousness about naming and commending reason."

Hort indicates what he regards as the right line of advance:

"It is vain to uphold either (on the one hand) a merely humanitarian theology: all study of nature dissolves it: an enlarged study of and care for humanity dissolves it hardly less: (or) on the other hand, a merely pantheistic theology in combination with a humanitarian morality or anthropology. Both the pantheistic and the humanitarian factors are needed in theology and in morality alike, and for the union of both. No evidence of the super-mundane God can have any power if we fail to discern the radiations of transmitted and derivative deity as the luminous and vital tissue of finite things."

English Modernism differs mainly from the older Broad or Liberal Churchmanship in being less individualist and less Erastian. It conceives of the Christian Religion as best realising its beneficent purpose for humanity through the operation of the Church, and therefore holds that it is the duty of the individual Christian to live in and work through the Church, which although it can often best serve the highest interests by closely co-operating with the State, is yet essentially independent of it should the State's policy be in conflict with Christian principles. The Modernist's ideal is not "a free Church in a free State," but "a Christian Church in a Christian State."

The English Modernist differs mainly from the Roman Modernist in being neither pantheistic in his theology, nor pragmatist in his philosophy: neither does he identify the Christ with the Catholic Church. The English Modernist is one with the Roman Modernist in his plea for the continuous development of Christian theology based on the truth-seeking interpretation of an enlarging Christian experience, and in the demand that scientific methods and historical criticism must be used to the full in the elucidation and presentation of Christian doctrine.

Modernism claims to offer three great advantages over Traditionalism which are as much in harmony with essential Christianity as with the modern mind. It satisfies the modern Christian's intellect by giving him freedom of research; his conscience by giving him freedom to teach the truth as he learns it: his heart by admitting to Christian fellowship all who call Jesus Lord. Modernism claims to be in harmony with the fundamental character of the English Church and should assist that body to realise its function as the reunion-centre of a reformed and progressive Christendom.

In Convocation in 1914 Bishop Hicks of Lincoln said: "I believe the men who may be called English Modernists are not unsettling the faith, but interpreting it, and making it clear to the modern man, and within a generation they will be looked back to as men who helped to build the faith of the English Church." The chief English Modernist society is "The Modern Churchmen's Union for the advancement of Liberal Religious Thought," founded in 1898. Its organ is *The Modern Churchman,* a monthly magazine, founded in 1911.

The United States.—In America the term Modernism is used in a somewhat different sense from the way it is used in England. Full treatment of the controversy in America between the Fundamentalist and Modernist groups is given in the article FUNDAMENTALISM AND MODERNISM.

(H. D. A. M.)

MODERN TENDENCIES IN APPLIED ART. No exact date can mark the beginning of the modern movement in applied art. Whenever men grew tired of reproducing the decorative formulae of the periods preceding the industrial revolution and turned to the creation of new forms and new motives, then and there were the beginnings. One might point to the porcelain table service of Felix Bracquemond exhibited at the Paris exhibition of 1867 as a very early appearance, but in reality this was but the application to western forms of Japanese motives, then just brought to the attention of artistic Europe.

On the other hand, it would hardly be correct to mention William Morris as a precursor of the modern movement, inasmuch as his valiant struggle was not aimed against the old forms but against the machine and commercialism, and his own creations were always a reflection of the mediaeval spirit. The influence of Morris on later developments, however, was very great, if indirect. In the first place it was largely through his teachings

and example that the English Arts and Crafts movement came into being, and although the underlying principles and motives of this revival did not make for modernism as conceived to-day, many things were produced by the craft-workers that were essentially of this spirit, especially in woodwork, ceramics and embroidery. Furthermore, it was the ideals of the Morris group and the English artist craftsman that perhaps more than any other influence inspired the beginnings of the true modern movement in Vienna and southern Germany.

The first definite appearance of creations in the intention now identified as modern, would seem to have occurred at Paris in the decade of the '80s in the field of the smaller crafts, particularly in ceramics and glass. The French had long been acquainted with Japanese prints and pottery, but it was not until the '90s that Chinese ceramics of the Tang and Sung periods became known. Certain craftsmen became filled with intense desire to discover the secret of the glazes of these wares and after much labour and research success crowned the efforts of Carriès and Chaplet. Delaherche continued these studies and shortly began to produce the remarkable series of sober, rich, deep-toned stoneware of the high fire kiln that have marked his long career. Rejecting all ornamentation and relying on the manifold decorative glaze effects produced at high temperatures, he initiated the triumph of *grès au grand feu* that has remained ever since the high and characteristic achievement of French ceramics. The work of these craftsmen, together with that of Dalpayrat and Lachenal attracted great attention and favourable comment at the International Exposition of 1889 in Paris. Side by side with these ceramic triumphs was the glass of Emile Gallé of Nancy. Gallé, an artist of versatile talent, had been experimenting for many years with various glass-techniques, all of which relied upon the material itself for decorative effect. (*See* GLASS, MODERN, EUROPEAN for work of Gallé.)

The buildings of the Exposition were also a very distinct expression of modernism. The genius of the architects, through appropriate use of iron, concrete, glass and terra cotta, produced a number of delightful creations in form and colour, which were at the same time dignified and imposing. It is in the decade of the '90s, however, that the modern movement becomes widespread in western Europe. To try to establish priority among these developments would be a fruitless task and one that would inevitably lead to controversy. Nevertheless, it is clear that important activities in the field of decoration and furniture design were occurring very early in Brussels. Here, in 1894, took place an exhibition of the so-called "Free Aesthetics," among whom were Henry van de Velde, Victor Horta, S. van Rysselberghe, Serrurier-Bovy and Paul Hankar. First among these in genius for design and later influence was van de Velde. Educated as a painter, he early found the brush inadequate as a means of expressing his reactions towards contemporary life and turned to the design of furniture and household decoration. At heart a believer in functional design and sound construction, he was at first caught in the mesh of the curved line, then almost universally in vogue, and evolved a peculiar whiplash curve, which he designated "the line of force."

In 1895 van de Velde exhibited four complete rooms in the establishment that had just been opened by S. Bing in Paris. These rooms were shown two years later at the Art Exhibition at Dresden and made a profound impression upon German craftsmen and designers.

Van de Velde was soon commissioned to construct the Folkwang Museum in Hagen, Westphalia, and the completion of this interesting building in 1902 served to cement his position in Germany as a leader in the new movement. Meanwhile the grand duke of Weimar, whose ambition was to improve artistic instruction in his country, offered this task and problem to van de Velde, who accepted and installed his studio in the art school later known as the "Bauhaus." Here he continued to exercise an important influence on the decorative arts of Germany until the outbreak of the World War. His work in Germany culminated in the beautiful and severe theatre built for the "International Art Exposition" at Cologne in 1914.

The first fruition of van de Velde's ideas, however, was not in Germany, but in Paris. There in 1895, Bing, who had for many years maintained a shop for the sale of Japanese prints and other examples of Oriental art, set up an establishment, *L'art nouveau,* for the display of modern art. At first the work of various artists and craftsmen was assembled, but finding harmonious ensembles impracticable in this way, Bing secured the services of a corps of designers, among whom were E. Colonna, De Feure and Gaillard engaged in production. As has been noted above, four rooms of van de Velde were exhibited here in 1895 and the characteristic curve originated by the Belgian was adopted by Bing as the peculiar motive for *l'art nouveau.* At this time French furniture exhibited a mixture of influences: English arts and crafts, reminiscences of Eastlake, naturalistic decoration and above all a welter of curved lines generally awkward and clumsy. This latter chaos the workers of Bing crystallized into a style by the adoption of the whiplash curve. It was a motive far too subtle to be handled successfully by any except highly talented designers, but it was exactly such individuals that the "Etablissement Bing" had employed, and some of the productions of Colonna and Gaillard stand to-day as unchallenged masterpieces of design—masterpieces in which a highly artificial motive was used to produce creations of much charm, that were at the same time guilty of no structural enormities.

L'art nouveau was the sensation of the Paris International Exposition of 1900. Its success was its undoing. The new motives became at once the vogue, with the result that manufacturers in large numbers hastened to gain profit from their popularity. To give the new quality to their production, they called upon designers of all degrees of capacity. Consequently motives requiring the hand of a master were soon vulgarized and cheapened and the whole movement reduced to absurd and fantastic exaggerations. *L'art nouveau* was but an episode in the modern movement—a brilliant episode, but one based on a decorative motive and not on sound considerations of the vital tendencies of modern life. It had no organic relations with function or structure and from its nature was destined to a short life. At this exposition also Louis Tiffany of New York exhibited his creations in "Favrille-glass" of which the beautiful and subtle colour effects, often iridescent, attracted wide attention.

The jewelry of René Lalique was also one of the features of 1900. Employing novel and richly-coloured materials and all the resources of the carver, engraver, and enameller, this prolific artist exhibited numberless examples of brooches, necklaces, combs and other dress ornaments that ran the entire gamut of the curved line and made of jewellery a charming decorative adornment rather than a mere exhibit of costly gems.

One must also note the remarkable efflorescence of the French poster that occurred at a somewhat earlier period. Six artists, Chéret, Grasset, Toulouse, Lautrec, Steinlen and Mucha, captivated the interest of the entire world and carried the art of the poster to a point not since surpassed. (*See* POSTER.)

In 1910 there was an important exhibit of the work of Munich artists and designers at the *salon d'automne* in Paris. Viewed from the standpoint of to-day the displays were not brilliant nor wholly consistent, but they were in a number of cases marked by simplicity of structure and of practical quality, at that time rare in the French designs, and they undoubtedly brought to French artists a needed sobering and fresh consideration of fundamentals.

To bring the picture of the movement into perspective it is necessary to turn to the earlier developments in Germany and Vienna. In the years before 1900 furniture and decoration in Germany that did not follow the old lines showed a mixture of influences: traces of the *Alt-Deutsch* of the '70s and '80s; adaptations of the English arts and crafts, particularly of the Glasgow school, and some reflection of the curves of van de Velde. In 1899 the grand duke of Hesse-Darmstadt invited the Viennese architect Josef M. Olbrich to come to Darmstadt and design the houses of an artists' colony in the suburb of Mathildenhöhe. These houses together with an exhibition-building were for the most part built in the following year, and a number of artists, among whom were Peter Behrens, Hans Christiansen, Ludwig Habich and Patriz Huber, became members of the colony. The

houses exhibited much variety and novelty of design and while free from conventional architectural motives were marked by sobriety and fineness of proportion.

The first exhibit of the artistic creations of the colony was held in 1901 and showed many interesting experiments in modernism. Other influences quickly made themselves felt. In 1898 the grand duke had invited the English architect Baillie-Scott, a foremost exponent of the arts and crafts revival, to decorate two rooms in his palace. The designs of this artist for furniture and house decoration quickly became popular all over Germany. Many examples of his furniture were made and sold in the Wertheim department store in Berlin.

It is quite beyond the limitations of this article to make more than a reference to the development of German architecture in the years between 1900 and the World War. Suffice it to say that the talent of Olbrich, Messel, Peter Behrens and many others created in their buildings during this period the only unified architectural expression in Europe worthy of being called a modern style. The influence of this architectural development was felt and is still felt strongly not only all over Germany, but in the countries of Central and Southern Europe.

The quality that distinguished the German movement from that in all other countries was its widespread organization and the encouragement received from powerful official and industrial agencies. Prominent among the organizations that championed the new movement was the *Deutsche Werkbund,* founded in 1908. Its aims were to ennoble industrial work, to bring about co-operation between art and industry and the work of the artisans by means of instruction, of propaganda and of common action in situations where it was appropriate. Towards 1910 it numbered 732 members, of whom 360 were artists, 267 industrialists and business men, and 105 amateurs and officials of museums and other interested persons. The *Werkbund* aimed at bringing together all the active forces in the art industries and in trade and commerce. It carried out its programme by such methods as exhibitions, lectures, and publications.

The General Electric Company developed an artistic department with Peter Behrens as counsellor. The great printing companies studied the work of talented typographic artists to improve the character of type and to develop new styles in posters, placards and head lines. The publishers of art periodicals lent themselves industriously to the exposition of the new movement. Many of the large department stores erected new buildings in the modern spirit. Those of Wertheim at Berlin and Tietz at Düsseldorf were especially noteworthy. The *Werkbund* pushed to the front those architects who were foremost in the new movement for the design of municipal architecture, such as city halls, railway stations, theatres, and markets. Other organizations were developed, such as the *Deutsche Werkstätten für Handwerkskunst* in Munich. This organization dealt with all phases of decoration and applied art, making inexpensive furniture in quantity at its model factory at Hellerau and finer cabinet work at Munich.

Vienna contributed a very interesting chapter to the modern movement. Here in 1896 was organized the *Secession* as a protest against the academic quality in the arts. The society was dedicated to the purpose of bringing to Vienna from the outside world all healthy influences making for modernism. Prominent among the founders were Gustav Klimt, Josef Hoffmann, Alfred Roller, Koloman Moser, F. Andri and Josef Olbrich, who built the *Secession* building in 1898. At the second exhibition of the Society in 1898 were shown examples of applied arts from England and France, and for many years the annual exhibitions welcomed the work of the pioneers in modernism from all European countries. In the expansion of the applied arts that followed the organization of the *Secession* movement, the influence of the English arts and crafts, as expressed by C. R. Ashbee, Voysey, and Baillie-Scott, and that of the Glasgow school headed by Mackintosh, was very great.

In 1903, the *Wiener Werkstätte* was organized through the financial assistance of Fritz Waerndofer. For two years the society co-operated with the *Secession,* but in 1905 established an independent existence with Josef Hoffmann as the guiding influence. The *Werkstätte* developed a business organization, employing its own designers and craftsmen and maintaining workshops for the fabrication of products. It aimed at introducing artistic furnishings into everyday life and at bringing about closer relations between art and industry.

Many of the products of the Viennese artists exhibit a naïve, playful, and charming character that well reflects the atmosphere of the city. Especially typical of this kind of work are the bright-glazed, low-fired figurines by Vally Wieselthier, Susi Singer, Herta Bucher, and others. Leather goods and printed textiles have always been noteworthy among the products of this city, and they have received delightful expression at the hands of modern artists. One of the exquisite achievements of Viennese art is the engraved glass of J. and L. Lobmeyr. This firm has employed the foremost artists available in Central Europe to design the forms and decoration of their products, and has brought to their execution the highest type of technical skill.

Architects from the first exercised a strong influence upon the modern movement in Vienna. In 1895 *Modern Architecture* appeared, written by the architect Otto Wagner, a professor in the Vienna Academy. It was the first appearance of the new doctrines and the younger architects rallied to their support. Among Wagner's students were many notable men. First among these was Josef Olbrich, a man of many talents, who, as noted before, built the artists' colony in Darmstadt and exercised a profound influence on German design in the early years of the present century. Another of Wagner's pupils was Josef Hoffmann, who in 1899 became professor in the *Kunstgewerbe Schule* in Vienna. While first of all an architect who has designed many buildings in the suburbs of Vienna and other places in Europe, he is also an artist craftsman with an intimate knowledge of processes and the possibilities of materials. For 25 years he has devoted a large part of his time and energy to applied art, in which field he has been for long the recognized leader of the modern Viennese school. In 1908 Hoffmann built the Stocklet house at Brussels, which remains to-day, in its interior design and furnishings the most important residence the modern style has yet produced. Hoffmann designed the house to express the owner, a wealthy banker possessing an extraordinary collection of oriental and occidental applied art. He employed vigorous rectangular forms to suggest power, and precious and beautiful marbles to give an atmosphere of richness. The walls of the dining-room were decorated by notable mosaics designed by Gustav Klimt.

In this modern development of Viennese applied art a very important influence was exerted and is still exerted by the *Kunstgewerbe Schule* which early attracted to its staff many of the most talented and creative spirits of the time and which has for 30 years placed great emphasis upon original design through actual craft work. As can be seen, the Viennese movement has been led by a group of highly trained and cultivated persons who have guided its course within sophisticated channels, but running through its manifestations is constantly discernible a warm strain which reflects the manifold racial qualities of the peoples comprising the former Austrian Empire.

Any reference to modern tendencies would be incomplete without mention of the ceramics of Copenhagen and the organization of industrial art matters in Sweden. The firms of Bing and Grondahl and the Royal Copenhagen Porcelain Factory have since their inception made most earnest efforts to combine multiproduction with the highest artistic quality. Great variety of character and technique characterizes the products of these establishments, some of which follow the lines of 19th century traditions, while others embody the spirit of modernism in a marked degree. The same energetically progressive attitude is found in several smaller establishments in Denmark where the individuality of the artist plays an even larger part to the advantage of the production.

Sweden has for many years enjoyed the advantage of an association (*Svenska Slöjdforeningen*) which has rendered substantial assistance to manufacturers and craftsmen in promoting higher standards of work. The products of Orrefors Bruks well illustrate the situation. Upon request of this establishment the

association recommended the employment of two artists, Simon Gate and Edward Hald. Within a few years the genius of these two men has brought the engraved glass of Orrefors to a well deserved world-wide reputation.

The World War brought all European art activities to a standstill. In Central Europe these have only of recent years been slowly resumed. France, the first to recover industrially, addressed herself to the effort to gain recognition in the international market as the exponent of the modern movement. Apparently resolved no longer to rest content with individual initiative and enterprise she has endeavoured to organize the activities in this field. For one thing instruction in the modern spirit of design is now offered in all the schools of applied art throughout the republic.

In the last decade each of the large department stores, Bon Marché, Galeries Lafayette, Printemps, and the Louvre, has inaugurated a special department offering all kinds of material conceived in the modern spirit, and has placed at the head of this department an individual of talent and reputation in this field. Each of these directors is furnished with a staff of designers and personally designs or superintends the design in his own studio of much of the material offered by his department. This development has had an important commercial result, inasmuch as it has popularized the movement by bringing its productions within the reach of the ordinary purse, whereas the modern creations up to a few years ago were to a large extent *objets de luxe* available only to the wealthy.

Another organized body of considerable importance is that of the *Société des Artistes Décorateurs,* who hold a salon embracing the field of the industrial arts each spring and autumn in the Grand Palais. For years this society has admitted to its expositions only works conceived in the modern spirit, and has refused place to all objects distinctly based upon the old styles. In the same direction is the important influence of the *Musée des Arts Décoratifs* and the *Musée Galliéra,* which hold frequent temporary expositions.

Finally, as the culminating recognition of a national attitude, France organized and carried through the International Exhibition of Modern Decorative and Industrial Arts in 1925. Perhaps the most important lesson to be derived from the exhibition was that which must be studied in all manifestations of modernism if the movement is to survive as a salutary influence in contemporary life, viz., that the only expressions in this new mode which are significant and which will serve to carry forward the level of applied art are those which conform to the age-old requirements of good design and at the same time possess those qualities which are in sympathy with the needs and taste of their times. Novelty for novelty's sake, queerness and freakishness of form that violate the demands of function and structure, are but the effort of mediocre designers to attract attention. These represent the incubus that holds back the movement, and that must be discounted to gauge its true meaning and possibilities. Much of the material shown at the exhibition was of this character. In each division there was to be found the work of only a few individuals possessed of sufficient culture, talent and understanding to interpret the tendencies of their times in forms both old in quality and yet new in spirit. If the modern movement is to be a real evolution it is obviously only the work of such men that is significant, and it is their creations that must be examined rightly to appraise its nature and its tendencies. That leadership of a high order was in evidence in the French section of the exhibition is hardly to be disputed. Whether the rank and file of French producers will take their cue from these sources or continue to follow after mere novelty remains to be seen.

Germany since the war has been gradually resuming interest in modernism. The heavy and awkward character often to be seen in the earlier ventures has very largely disappeared and the productions of many establishments, particularly those of the *Deutsche Werkstätte* of Munich and Hellerau, are marked with fine sobriety, simplicity and good taste together with moderate cost. The German schools of industrial art play a very important part in the present day situation. Often directed by men of exceptional talent, they are almost as a unit emphasizing design in the new spirit and adding to this thorough and intensive constructive processes.

In England a number of individuals, whose initial devotion was to the arts and crafts, have continued their creative work into later times and have made valuable contributions to modern design. One establishment, Heal and Son, under the direction of Ambrose Heal, has served as a connecting link between the two periods and in its productions during the last 30 years has presented a continuous picture of the highest expression of English modernism. This firm has not only exhibited a fine sanity and purity of taste in its own furniture, but it has constantly presented and encouraged the best efforts of English manufacturers and craftsmen in many other branches of applied art. This is particularly true of ceramics, in which field the products of the great English potteries as well as those of individual craftsmen have been given prominent place.

After the scant display of modern furniture at the Paris exhibition of 1925, English manufacturers showed rather surprising activity which in three years resulted in an exhibition of a dozen furnished rooms in London, some of which displayed a sound grasp of the true spirit of modernism and attained a high degree of artistic taste.

A factor of most promising character has arisen in the progress of English applied arts, in the form of the Design and Industries Association, founded during the World War by a group of educators, designers, craftsmen and manufacturers. The rational and progressive attitude of the Association towards industrial art has already made an impression upon public thought and has achieved certain distinct influences upon production.

In the United States the development of modernism has been marked in a few lines, but it is very uneven when the whole field is considered. In the design of the tall office building in the large cities America has evolved a distinct modern type. In a situation in which many well equipped minds are working on the same problem—a problem involving for its solution the adjustment of rigid requirements of many kinds—social, physical, legal, economic and aesthetic—a result has been arrived at which, if it cannot be termed a style, is at least characterized by very definite and uniform tendencies and very modern qualities. Considered purely from the aesthetic side, these buildings show an increasing subordination of surface ornament and reliance upon fineness of line, mass and proportion, and the dignity of plain surfaces.

In the United States as in every other Western country, woman's outdoor dress is the most significant of all expressions of modern taste. Such dresses, compared with those of 35 years ago show a remarkable and rapid evolution. In response to the modern demands for greater freedom and more natural living, feminine costume has passed from an extreme of complexity and artificiality to an extreme of simplicity of which no one can gainsay the aesthetic advantage. (*See* DRESS, *Modern.*)

The more sober coloured winter street dress reflects the same qualities as those represented by other modern creations, viz., elimination of artificial ornament, emphasis upon functional form and tendency towards quiet spaces that gain interest from the material itself. These are qualities fundamental to modern design, but by themselves they are obviously not enough to express completely this age, with its speed, its innovations, its unconventionality, intellectual activity and new ideas. On this side modern life craves fantasy, novelty and fine colour and it is woman's dress that has first of all responded to this desire in the warm weather street and sport clothing of recent years.

This demand for strong beautiful colour and playful fantasy, felt more and more by Western peoples ever since the first vision of the Russian ballet, is one that extends to almost all phases of decoration (hangings, furniture stuffs, murals, floor and wall coverings and graphic advertising) and that brings with it an increasing problem of composition in a difficult field.

To sum up the general situation one might venture to state that wherever natural forces, such as social ideals, emulation, competition or seasonal demands, make for frequent changes

and adjustments, there one finds highly developed critical taste on the part of the consumer, continuous artistic progress and inevitable acceptance of the principles underlying modern design.

Where these forces are either wanting or relatively weak, and this applies in large degree to all our household furnishings, progress is much slower and much more dependent upon the chance of leadership. Inasmuch as a transition epoch from its very nature can produce but few leaders with the ability and vision to interpret the needs and tendencies of their time in forms of beauty, a manifest critical need of this period is for public discrimination as to what is sound and fundamental in contemporary design and what is merely casual and novel.

It is still too early to forecast with any certainty the ultimate significance of these developments of the last 30 years, but it is difficult to escape the conclusion that the essential qualities that are increasingly apparent in the best of present day applied art are too much a part of the vital and organic tendencies of modern times to be ephemeral.

MODES, ECCLESIASTICAL. The scales of early ecclesiastical music are not those used in the classical music of modern times. They form a series of eight, differing from one another not merely in pitch but in character. (*See* Harmony; Plainsong.)

MODESTINUS, HERENNIUS, a celebrated Roman jurist, who flourished about 250 B.C. He appears to have been a native of one of the Greek-speaking provinces, probably Dalmatia, and was a pupil of Ulpian. In Valentinian's *Law of Citations* he is classed with Papinian, Paulus, Gaius and Ulpian. He is mentioned in a rescript of Gordian in the year 240 B.C. No fewer than 345 passages in the *Digest* are taken from his writings.

MODESTO, a city of central California, U.S.A., 90 m. E. by S. of San Francisco, in the northern end of the San Joaquin valley, on the Tuolumne river; the county seat of Stanislaus county. It is on the Pacific highway, has a municipal airport and is served by the Santa Fe, the Southern Pacific and the Western Pacific railways, and by auto-stages and motor-truck lines. Pop. (1920) 9,241 (88% native white); in 1930 it was 13,842. Modesto is in the midst of 400,000 ac. of irrigated land, supplied with abundant water and power from the Don Pedro dam, hydro-electric plant, and storage reservoir in the foot-hills. Dairy and poultry products, forage crops, vegetables (notably beans), peaches, grapes, melons and a great variety of other fruits and nuts are produced in the county to the value of $40,000,000 annually. The city cans 750,000 cases of fruits and vegetables a year, and its co-operative creamery, with a membership of 2,000 dairymen, makes 5,000,000 lb. of butter and 5,000,000 lb. of skim-milk powder. The city's assessed valuation of property for 1927 was $14,087,865. Bank clearings in 1927 totalled $136,416,764. Modesto was planned in 1870 and incorporated in 1884. In 1893 the La Grange diverting dam on the Tuolumne river was completed, and after ten years' delay, due to litigation, water was turned into the ditches in 1903, and the transformation of the district from a vast wheat-field to a region of diversified agriculture began. The Don Pedro storage dam was completed in 1923. Between 1900 and 1920 the population increased nearly fivefold. Since 1911 the city has had a commission form of government.

MODICA, a town of Sicily, in the province of Syracuse, 57 m. W.S.W. of Syracuse by rail and 33 m. direct. Pop. (1921) 55,817 (town); 60,192 (commune). It lies on a hill between two valleys, which was the site of the Sicel town of Motyca, while the modern part of the town extends along the river Mauro, an inundation of which did much damage in September 1902. Six miles south-east is the valley of the Cava d'Ispica, with hundreds of grottoes cut in its rocky sides, some Sicel tombs, but mostly catacombs or tombs of the early Christian and Byzantine periods, or cave-dwellings of the latter age.

MODILLION, in architecture, the enriched block or horizontal bracket generally occurring in rows under the corona, or projecting portion and above the bed-mould of the Corinthian cornice. (*See* Order.)

MODJESKA, HELENA (1844–1909), Polish actress, daughter of a musician, Michael Opido, was born at Cracow on Oct. 12, 1844. After her marriage, to a Pole named Modrzejewski, she joined a company of strolling players. In 1868 she married Count Bozenta Chlapowski, a Polish politician and critic, and then began to act at Warsaw, where she remained for seven or eight years. Her chief tragic rôles were Ophelia, Juliet, Desdemona, Queen Anne in *Richard III.*, Louisa Miller, Maria Stuart, Schiller's Princess Eboli, Marion Delorme, Victor Hugo's Tisbé and Slowacki's Mazeppa. In comedy her favourite rôles were Beatrice in *Much Ado About Nothing,* and Donna Diana in the Polish translation of an old Spanish play of that name. Madame Modjeska also played in modern pieces by Legouvé, Dumas, father and son, Augier, Alfred de Musset, Octave Feuillet and Sardou. In 1876 she went with her husband to California, where they settled on a ranch. This enterprise was a failure, and Modjeska returned to the stage. She appeared in San Francisco in 1877, in an English version of *Adrienne Lecouvreur.* She continued to act principally in America, but was also seen from time to time in London and elsewhere in the United Kingdom, her repertory including several Shakespearian rôles and a variety of emotional parts in modern drama. She died on April 9, 1909, at her home near Los Angeles, California.

See Mabel Collins, *The Story of Helena Modjeska* (London, 1883), and the (autobiographical) *Memories and Impressions* (New York, 1910).

MODJESKI, RALPH (1861–), American engineer, was born at Cracow, Poland, Jan. 27, 1861, his mother being the actress, Helena Modjeska. He graduated at the École des Ponts et Chaussées, Paris, with high honours, and settled in the United States. From 1892, he practised as consulting bridge engineer at Chicago and as a designer and builder of bridges he did distinguished work. Among his best known bridges are the Government bridge over the Mississippi at Rock Island; the McKinley bridge at St. Louis; the bridges over the Mississippi at Thebes (Ill.) and at Memphis (Tenn.); the Northern Pacific bridge over the Missouri at Bismarck (N.D.); also bridges over the Columbia and Willamette rivers in Oregon. He was a member of the Quebec bridge commission, and consulting engineer for the Ohio river bridge at Metropolis (Ill.), for the Chicago, Burlington and Quincy Railroad, and the Thames river bridge at New Haven (Conn.), for the New York, New Haven and Hartford Railroad. He was chosen chief engineer and chairman of the board of engineers of the Philadelphia-Camden bridge over the Delaware river, which, on its completion, in 1926, was the longest suspension bridge in the world. He was appointed chief engineer of the proposed bridge over the Mississippi river at New Orleans for the Public Belt Railroad of New Orleans, also for the bridges over the Atchafalaya river at Melville (La.), for the Texas and Pacific Railway.

MÖDLING is a popular summer resort for the Viennese and lies at the entrance to the Brühl valley, Lower Austria. In addition to the numbers of tourists attracted by its iron and sulphur baths it has important assets in its considerable iron and metal industries and shoe factories. Pop. (1923), 18,695.

MODOC, a tribe which formed the southern portion of the so-called Lutuami group, the Klamath constituting the northern and larger portion. Between them the two tribes held the Klamath lake basin, and are scarcely distinguishable in speech or customs. The Klamath were wholly in Oregon, the Modoc partly in California. Modoc means south. In 1873 part of the Modoc attempted to reoccupy lands they had ceded to the Government, defied the troops, and for three months stood off several companies of soldiers from their refuge in the broken Modoc lava beds. In the course of negotiations Gen. Canby was murdered by treachery, for which the Modoc leader, Kintpuash or Captain Jack, and several companions were later hanged. The whole hostile force numbered only 200, including women and children; part of the Modoc and all the Klamath remained peaceable. The present population of the Modoc and Klamath jointly is 1,100.

See A. S. Gatschet, *The Klamath Indians* (1891); J. Curtin, *Myths of the Modocs* (1912).

MODULATION, in music, signifies the passing from one key to another. The term "transition" is also used, though principally to designate very brief and transient modulations to keys not dwelt in. Modulation is of various kinds, as "natural" when the change is to one or other of the "relatives" of the original key; "extraneous" when it is to keys other than relative, *i.e.*, more remote; or "enharmonic" when it is effected by a change of notation. Modulation constitutes one of the greatest resources of music as we know it and is employed by modern composers to an ever-increasing extent. (*See* ENHARMONIC; KEY; HARMONY.)

Modulation, as the term is used in radio, is the process whereby the frequency or amplitude of a wave is varied in accordance with a signal wave. A modulator is a device to effect the process of modulation. It may be operated by virtue of some non-linear characteristic and also by a controlled variation of some circuit quantity.

MODULE, in architecture, any unit adopted for measuring the relative proportions of the different parts of a building or decorative form. The term is relative only; the module chosen may vary infinitely in actual dimension. The module chosen by Vitruvius (iv., 3) for determining the proportions of a classic order (*q.v.*) was half the bottom diameter of a column. This module is sub-divided in various ways by different authorities; Vitruvius usually used six sub-divisions; in the later Renaissance, in the effort to obtain the most accurate proportions, the sub-divisions were sometimes increased to as many as 30. A new system of modules has recently come into vogue in all sorts of artistic criticism, based on the relations of the diagonal of a rectangle to its sides. With scales of relative value so established, it has been claimed that the proportions of many beautiful objects can be determined. This view is much contested and is at the basis of one of the greatest controversies in current art criticism. The term module is also applied in hydraulics (*q.v.*) to a device for regulating the supply of water from an irrigation channel.

MOERIS, AELIUS, Greek grammarian, surnamed *Atticista* ("the Atticist"), probably flourished in the 2nd century A.D. He was the author of an extant list of Attic forms and expressions (Ἀττικαὶ λέξεις), accompanied by the Hellenistic parallels of his own time, the differences of gender, accent and meaning being clearly and succinctly pointed out.

Editions by J. Hudson (1711); J. Pierson (1759); A. Koch (1830); I. Bekker (1833); with Harpocration.

MOERIS, LAKE OF, the history of the lake which once occupied a considerable area of the Fayûm depression, and which to-day is represented by the shallow Birket Qarun, has been much elucidated by the geological and archaeological work which has been recently carried out in the desert margin of the depression. From the results obtained it would appear that in later palaeolithic times the lake level reached a point about 130 feet above sea-level, or about 280 feet above the present lake. During neolithic times the level fell slowly for about 140 feet, though there were occasional interruptions when it remained at one level long enough to allow formation of beaches which can still be traced. Throughout this period primitive settlements occupied its shoreline, and down to early dynastic times the level does not seem to have varied greatly. Later however through the dynastic period the level of the lake fell slowly as a result probably of climatic conditions of greater aridity, though the fall was retarded from time to time as the volume of surplus water brought in from the Nile in order to irrigate the cultivated lands was greater or less.

The cultivated lands above the level of the lake which were irrigated from the Nile were some of the most fertile in Egypt so long as the supply canals from the river were maintained in good order, though this doubtless varied with the political conditions of Egypt. The Egyptian name of the lake was Shei, "the lake," later Piôm, "the sea" (whence Fayûm); Teshei, "the land of the lake," was the early name of the region. At its capital Crocodilopolis and elsewhere the crocodile god Sobk (Suchus) was worshipped. Senwosrê II. of the XIIth Dynasty built his pyramid at Illahun. Amenemhêt III. built his near Hawara, and the vast labyrinth attached to it was probably his funerary temple. This king was afterwards worshipped in more than one locality about the lake under the name Marres (his praenomen Nemarē) or Peremarres, *i.e.*, Pharaoh Marres. In the reign of Ptolemy Philadelphus veterans from the Syrian War were settled in the "Lake" (Λίμνη), and the latter quickly became a populous and very fertile province. Strabo's account of the Lake of Moeris must be copied from earlier writers, for in his day the outflow had been stopped probably for two centuries, and the old bed of the lake was dotted with flourishing villages to a great depth below the level of the Nile. Large numbers of papyri of the Ptolemaic and Roman periods have been found in and about the Fayûm, which continued to flourish through the first two centuries of the Roman rule. The level of the lake varies from year to year with the amount of irrigation water which reaches it from the Nile. Its average level is now about 147 ft. below sea-level.

Beadnell, *The Topography and Geology of the Fayûm Province of Egypt* (Cairo, 1905); G. Caton Thompson and E. W. Gardner, *Geog. Journ.* (1929). (F. LL. G.)

MOESIA, a district inhabited by a Thracian people, bounded on the south by the mountain ranges of Haemus and Scardus, on the west by the Drinus, on the north by the Danube and on the east by the Euxine. Some, however, place the boundary much farther west. Each was governed by an imperial consular legate and a procurator. It corresponded in the main to modern Serbia and Bulgaria. In 75 B.C., C. Scribonius Curio, proconsul of Macedonia, penetrated as far as the Danube, and gained a victory over the inhabitants, who were finally subdued by M. Licinius Crassus, grandson of the triumvir and also proconsul of Macedonia, during the reign of Augustus *c.* 29 B.C.; the country, however, was not organized as a province until the last years of the reign. Originally one province, under an imperial legate (who probably also had control of Achaea and Macedonia), it was divided by Domitian into Upper and Lower Moesia, the western and eastern portions respectively, divided from each other by the river Cebrus. As a frontier province, Moesia was strengthened by stations and fortresses erected along the southern bank of the Danube, and a wall was built from Axiopolis to Tomi as a protection against Scythian and Sarmatian inroads. After the abandonment of Dacia (*q.v.*) to the barbarians by Aurelian (270–275) and the transference of its inhabitants to the south of the Danube, the central portion of Moesia took the name of Dacia Aureliani. The Goths, who had already invaded Moesia in 250, hard pressed by the Huns, again crossed the Danube during the reign of Valens (376), and with his permission settled in Moesia. But quarrels soon took place, and the Goths under Fritigern defeated Valens in a great battle near Adrianople (378). These Goths are known as Moeso-Goths, for whom Ulfilas made the Gothic translation of the Bible. In the 7th century Slavs and Bulgarians entered the country and founded the modern kingdoms of Serbia and Bulgaria.

MOFAḌḌALĪYĀT, strictly MUFAḌḌALĪYĀT, an anthology of ancient Arabic poems, which derives its name from al-Mufaḍḍal, son of Muḥammad, son of Ya'lā, a member of the tribe of Ḍabba, who compiled it some time between A.D. 762 and 784 in the latter of which years he died. Al-Mufaḍḍal was a contemporary of Ḥammād ar-Rāwiya and Khalaf al-Aḥmar, the famous collectors of ancient Arab poetry and tradition, and was somewhat the junior of Abū 'Amr ibn al-'Alā, the first scholar who systematically set himself to preserve the poetic literature of the Arabs. He died about fifty years before Abū 'Ubaida and al-Aṣma'ī, to whose labours posterity is largely indebted for the arrangement, elucidation and criticism of ancient Arabian verse; and his anthology was put together between fifty and sixty years before the compilation by Abū Tammām of the *Ḥamāsa* (*q.v.*).

Al-Mufaḍḍal was a careful and trustworthy collector both of texts and traditions, and is praised by all authorities on Arabian

history and literature as in this respect greatly the superior of Ḥammād and Khalaf, who are accused (especially the latter) of unscrupulous fabrication of poems in the style of the ancients. He was a native of Kūfa, the northernmost of the two great military colonies founded in 638 by the caliph 'Omar for the control of the wide Mesopotamian plain. In Kūfa and Baṣra were gathered representatives of all the Arabian tribes who formed the fighting force of the Islamic Empire, and from these al-Mufaḍḍal was able to collect and record the compositions of the poets who had celebrated the fortunes and exploits of their forefathers. He, no doubt, like al-Aṣma'ī and Abū 'Ubaida, also himself visited the areas occupied by the tribes for their camping grounds in the neighbouring desert; and adjacent to Kūfa was al-Ḥīra, the ancient capital of the Lakhmid kings, whose court was the most celebrated centre in pre-Islamic Arabia, where, in the century before the preaching of the Prophet, poets from the whole of the northern half of the peninsula were wont to assemble.

The date of al-Mufaḍḍal's birth is unknown; but he lived for many years under the caliphs of the Omayyad line until their overthrow by the 'Abbasids in 749. In 762 he took part in the rising led by Ibrāhīm ibn 'Abdallāh ibn al-Ḥasan, the 'Alid, called "The Pure Soul," against the caliph al-Manṣūr, and after the defeat and death of Ibrāhīm was cast into prison. Al-Manṣūr, however, pardoned him, and appointed him the instructor in literature of his son, afterwards the caliph al-Mahdī. It was for this prince that, at al-Manṣūr's instigation, al-Mufaḍḍal compiled the *Mufaḍḍalīyāt.*

The collection, in its present form, contains 126 pieces of verse, long and short; that is the number included in the recension of al-Anbārī, who had the text from Abū 'Ikrima of Ḍabba, who read it with Ibn al-A'rābī, the stepson and inheritor of the tradition of al-Mufaḍḍal. We know from the *Fihrist* of Muḥammad an-Nadīm (A.D. 988) that in his time 128 pieces were counted in the book; and this number agrees with that contained in the Vienna ms., which gives an additional poem, besides those annotated by al-Anbārī, to al-Muraqqish the Elder, and adds at the end a poem by al-Ḥārith ibn Ḥilliza. The *Fihrist* states (p. 68) that some scholars included more and others fewer poems, while the order of the poems in the several recensions differed; but the correct text, the author says, is that handed down through Ibn al-A'rābī. It is noticeable that this traditional text, and the accompanying scholia, as represented by al-Anbārī's recension, are wholly due to the scholars of Kūfa, to which place al-Mufaḍḍal himself belonged.

The collection is one of the highest importance as a record of the thought and poetic art of Arabia during the time immediately preceding the appearance of the Prophet. Not more than five or six of the 126 poems appear to have been composed by poets who had been born in Islām. The great majority of the authors belonged to the days of "the Ignorance," and though a certain number (*e.g.*, Mutammim ibn Nuwaira, Rabī'a ibn Maqrūm, 'Abda ibn aṭ-Ṭabīb and Abū Dhu'aib), born in paganism, accepted Islām, their work bears few marks of the new faith. The ancient virtues—hospitality to the guest and the poor, profuse expenditure of wealth, valour in battle, faithfulness to the cause of the tribe—are the themes of praise; wine and the game of *maisir,* forbidden by Islām, are celebrated by poets who professed themselves converts; and if there is no mention of the old idolatry, there is also little spirituality in the outlook on life. The 126 pieces are distributed among 68 poets, and the work represents a gathering from the compositions of those who were called *al-Muqillūn,* "authors of whom little has survived," in contrast to the famous poets whose works had been collected into *dīwāns.* At the same time many of them are extremely celebrated, and among the pieces selected by al-Mufaḍḍal several reach a very high level of excellence. Such are the two long poems of 'Alqama ibn 'Abada (Nos. 119 and 120), the three odes by Mutammim ibn Nuwaira (Nos. 9, 67, 68), the splendid poem of Salāma ibn Jandal (No. 22), the beautiful *nasīb* of ash-Shanfarā (No. 20), and the death-song of 'Abd-Yaghūth (No. 30). One of the most admirable and famous is the last of the series (No. 126), the long elegy by Abū Dhu'aib of Hudhail on the death of his sons; almost every verse of this poem is cited in illustration of some phrase or meaning of a word in the national lexicons. Only one of the poets of the *Mo'allaqāt* (*see* MO'ALLAQĀT), al-Ḥārith, son of Ḥilliza, is represented in the collection. An interesting feature of the work to be noted is the treatment in it of the two poets of Bakr ibn Wā'il, uncle and nephew, called al-Muraqqish, who are perhaps the most ancient in the collection. The elder Muraqqish was the great-uncle of Ṭarafa of Bakr, the author of the Mo'allaqa, and took part in the long warfare between the sister tribes of Bakr and Taghlib, called the war of Basūs, which began about the end of the 5th century A.D. Al-Mufaḍḍal has included ten pieces (Nos. 45–54) by him in the collection, which are chiefly interesting from an antiquarian point of view. It is probable that the compiler set down all he could gather of this ancient author, and that his interest in him was chiefly due to his antiquity. Of the younger Muraqqish, uncle of Ṭarafa, there are five pieces (Nos. 55–59). The only other authors of whom more than three poems are cited are Bishr ibn Abī Khāzim of Asad (Nos. 96–99) and Rabī'a ibn Maqrūm of Ḍabba (Nos. 38, 39, 43 and 113).

The *Mufaḍḍalīyāt* differs from the *Ḥamāsa* in being a collection of complete odes (*qaṣīdas*), while the latter is an anthology of brilliant passages specially selected for their interest or effectiveness, all that is prosaic or less striking being pruned away. It is of course not the case that all the poems of al-Mufaḍḍal's collection are complete. Many are mere fragments, and even in the longest there are often *lacunae*; but the compiler evidently set down all that he could collect of a poem from the memory of the *rāwīs,* and did not, like Abū Tammām, choose only the best portions. We are thus presented with a view of the literature of the age which is much more characteristic and comprehensive than that given by the brilliant poet to whom we owe the *Ḥamāsa,* and enables us to form a better judgment on the general level of poetic achievement.

The *Mufaḍḍalīyāt* is not well represented by mss. in the libraries of the West. There is an imperfect copy of the recension of al-Marzūqī (died 1030), with his commentary, in the Berlin collection. A very ancient fragment (dated 1080) of al-Anbārī's recension, containing five poems in whole or part, is in the Royal Library at Leipzig. In the British Museum there is a copy made about a century ago for C. J. Rich at Bagdad of a ms. with brief glosses; and at Vienna there is a modern copy of a ms. of which the original is at Constantinople, the glosses in which are taken from al-Anbārī, though the author had access also to al-Marzūqī. In the mosque libraries at Constantinople there are at least five mss.; and at Cairo there is a modern copy of one of these, containing the whole of al-Anbārī's commentary. In America there are at Yale University a modern copy of the same recension, taken from the same original as the Cairo copy, and a ms. of Persian origin, dated 1657, presenting a text identical with the Vienna codex. In recent years a very interesting ms., probably of the 6th century of the Hegira, but not dated, has come to light. It purports to be the second part of a combination of two anthologies, the *Mufaḍḍalīyāt* of al-Mufaḍḍal and the *Aṣma'īyāt* of al-Aṣma'ī, but contains many more poems than are in either of these collections as found elsewhere. The commentary appears to be eclectic, drawn partly (perhaps chiefly) from Ibn as-Sikkīt (died 858), and partly from Abū-Ja'far Aḥmad ibn 'Ubaid ibn Nāṣih, one of al-Anbārī's sources and a pupil of Ibn al-A'rābī; and the compilation seems to be older in date than al-Anbārī, since its glosses are often quoted by him without any name being mentioned. This ms. (which is the property of Mr. F. Krenkow of Leicester) appears to represent one of the recensions mentioned by Muḥammad an-Nadīm in the *Fihrist* (p. 68), to which reference has been made above.

In 1885 Professor Heinrich Thorbecke began an edition of the text based on the Berlin codex, but only the first fasciculus, containing forty-two poems, had appeared when his work was cut short by death. In 1891 the first volume of an edition of the text, with a short commentary taken from al-Anbārī, was printed at Constantinople. In 1906 an edition of the whole text, with short glosses taken from al-Anbārī's commentary, was published at Cairo by Abū Bakr b. 'Omar Dāghistānī al-Madanī; this follows

generally the Cairo codex above mentioned, but has profited by the scholarship of Professor Thorbecke's edition of the first half of the work. A complete edition of al-Anbārī's text and commentary, with a translation of the poems by Sir C. J. Lyall appeared in 1919. (C. J. L.)

MOFFAT, ROBERT (1795–1883), Scottish Congregationalist missionary to Africa, was born at Ormiston, Haddingtonshire, on Dec. 21, 1795, of humble parentage. He began as a gardener, but in 1814 when employed at High Leigh in Cheshire, offered himself to the London Missionary Society, and in 1816 was sent out to South Africa. After spending a year in Namaqua Land, with the chief Afrikaner, whom he converted, Moffat returned to Cape Town in 1819 and married Mary Smith (1795–1870), the daughter of a former employer. In 1820 Moffat and his wife left the Cape and proceeded to Griqua Town, and ultimately settled at Kuruman, among the Bechuana tribes living to the west of the Vaal river. Here he worked as a missionary till 1870, when he reluctantly returned finally to his native land. He made frequent journeys into the neighbouring regions as far north as the Matabele country. The results of these journeys he communicated to the Royal Geographical Society (*Journal* xxv.–xxxviii. and *Proceedings* ii.), and when in England on furlough (1839–1843) he published his well-known *Missionary Labours and Scenes in South Africa* (1842). He translated the whole of the Bible and *The Pilgrim's Progress* into Sechwana. Moffat was builder, carpenter, smith, gardener, farmer, all in one, and by precept and example he succeeded in turning a horde of bloodthirsty savages into a "people appreciating and cultivating the arts and habits of civilized life, with a written language of their own." David Livingstone was his son-in-law. He died at Leigh, near Tunbridge Wells, on Aug. 9, 1883. *See* also LIVINGSTONE, DAVID.

See *Lives of Robert and Mary Moffat*, by J. S. Moffat (1885); and C. S. Horne, *The Story of the L.M.S.* (1894).

MOFFAT, burgh and parish, Upper Annandale, Dumfriesshire, Scotland. Pop. (1931), 2,006. It is situated 21 m. N.N.E. of Dumfries and 63 m. by the L.M.S. line from Edinburgh and Glasgow. It has been famous for its sulphur and saline waters since the middle of the 18th century, and is a popular holiday resort. The spa lies a mile to the north of the town, and there are also spas at Hartfell (3½ m. N.) and Garpel (2 m. S.W.). Dumcrieff House, 2 m. S.W., the seat of Lord Rollo, was the home of Macadam, the road-builder.

MOFFAT TUNNEL, begun in 1923 and completed in 1928, is 6·2 m. long and pierces the continental divide 50 m. west of Denver, Colo., at an elevation of about 9,200 ft. above sea-level. The 16′×24′ tunnel, which provides for a single track standard gauge railroad, was driven parallel with and 75 ft. to the north of an 8′×8′ water tunnel with which it is connected at about 1,500 ft. intervals by cross cuts. It rises on a grade of 0·3% from the eastern entrance toward the centre and then descends on 0·8% and 0·9% grades to the western entrance.

The railway tunnel eliminated about 30 m. of 4% grades over Rollins' pass, reduced the maximum grade of the Denver and Salt Lake railway from 4% to 2%, and the maximum curvature from 16% to 12%. About 173 m. of the distance between Denver and Salt Lake City will eventually be saved. The water tunnel transports water for municipal and agricultural purposes in and around Denver from the western slope of the divide, and is designed to carry 450,000 gal. per minute. It is estimated that this water will add about 100,000 ac. of productive land to the territory adjacent to Denver. The tunnel is administered by the Moffat Tunnel Commission, and cost $15,470,000.

MOGADOR (*Es-Sueira*), the most southern seaport on the Atlantic coast of Morocco, in 31° 50′ N., 9° 20′ W., chief town of the *contrôle civil* of Chiadma. The town stands from 10 to 20 ft. above high water on a projecting ridge of calcareous sandstone. In certain states of wind and sea it is turned almost into an island, and a sea-wall protects the road to Saffi. On the land side stretch miles of sand-dunes studded with broom, and beyond, the argan forests, distinctive of southern Morocco. Approached from this side the city bursts on the view like a mirage between sky and sea. It is the best planned and cleanest town in the empire. The harbour is well sheltered from all winds except the south-west, but escape is difficult with the wind from that quarter, as the channel between the town and Mogador Island is narrow and hazardous. Pop. 18,401, of whom 9,836 are Muslims, 7,730 Jews, 835 Europeans. It is one of the towns of Morocco in which Jews are most numerous. Trade reaches 121 millions of francs (imports 59 millions, exports 62 millions). The share of France is 70 millions, that of Great Britain 31 millions, that of the United States 5 millions.

A place called Mogador is marked in the 1351 Portulan of the Laurentian library, and the map in Hondius's *Atlas minor* shows the island of Mogador, *I. Domegador;* but the origin of the present town is much more recent. Mogador was founded by Mohammed ben Abd Allah in 1760, and completed in 1770. The Portuguese called it after the shrine of Sidi Megdul, which lies towards the south half-way to the village of Diabat, and forms a striking landmark for seamen. In 1844 the citadel was bombarded by the French.

See A. H. Dyé, "Les Ports du Maroc," in *Bull. Soc. Geog. Comm. Paris* (1908), xxx. 313 *sqq.*, and British Consular reports.

MOGILA, PETER (*c.* 1596–1647), metropolitan of Kiev from 1632, belonged to a noble Wallachian family. He studied for some time at the university of Paris, and became a monk in 1625. He is known as the promoter of the *Orthodox Confession*, drawn up at his instance by the Abbot Kosslowski of Kiev, approved at a provincial synod in 1640, and accepted by the patriarchs of Constantinople, Jerusalem, Alexandria and Antioch in 1642–1643, and by the synod of Jerusalem in 1672. (*See* ORTHODOX EASTERN CHURCH.)

There are numerous editions of the *Confession* in Russian; it has been edited in Greek and Latin by Panagiotes (Amsterdam, 1662), by Hofmann (Leipzig, 1695), and by Kimmel (Jena, 1843), and there is a German translation by Frisch (Frankfort, 1727).

MOGILEV, a former government of western Russia now in the Ukrainian S.S.R. (*q.v.*).

MOGILEV ON THE DNIEPER, a town of the White Russian S.S.R., in 53° 55′ N., 30° 18′ E., on a hilly site on both banks of the river, and on the railway. Pop. (1926) 46,562. It has flour mills, a smelting industry, leather and tobacco manufactures and a brewery. It trades in corn, salt, sugar and fish from the south. It has an ancient Tatar tower, a 17th century church, a cathedral built for the Roman Catholics and one built for the Greek Orthodox church by Catherine II. of Russia and Joseph II. of Austria in 1780.

Mogilev is mentioned in the 14th century as a dependency of the Vitebsk, or of the Mstislavl principality. At the beginning of the 15th century it became the property of the Polish kings. But it was continually plundered—either by Russians, or by Cossacks. In the 17th century its inhabitants, who belonged to the Orthodox Greek Church, suffered much from the persecutions of the United Greek Church. In 1654 it surrendered to Russia, but in 1661 the Russian garrison was massacred by the inhabitants. In the 18th century the town was taken several times by Russians and by Swedes, and in 1708 Peter the Great ordered its destruction by fire. It was annexed to Russia in 1772. Near here the French under Davoût defeated the Russians under Bagration on July 23, 1812. It was the scene of much strife in the 1917–20 period.

MOGILEV ON THE DNIESTER (MOGILEV-PODOLSK), a town of the Ukrainian S.S.R., on the left bank of the river in 48° 27′ N., 27° 45′ E. Pop. (1926) 22,271. The former trade of the town along the Dniester has been checked by the state of armed neutrality existing at present between Russia and Rumania on the question of Bessarabia. It has several flour-mills, a distillery, a sugar refinery and a chalk factory. Mogilev, named in honour of the Moldavian hospodar Mohila, was founded by Count Potocki about the end of the 16th century. Owing to its situation on the highway from Moldavia to the Ukraine, at the passage across the Dniester, it developed rapidly. For more than 150 years its possession was disputed between the Cossacks, the Poles and the Turks. It remained in the hands of the Poles, and was annexed to Russia in 1795. It suffered much during the war and civil war of 1914–20.

MOGUL, MOGHAL, or **MUGHAL,** the Arabic and Persian form of the word Mongol, applied to the Mohammedan empire in India, which was founded by Baber. In consequence the name is applied to all Mohammedans from the countries on the west and north-west of India, except the Pathans. The Great Mogul is the name given to the Mogul emperors of Delhi.

MOHÁCS, a Hungarian town on the right bank of the Danube, acts as a market for the vineyards and agricultural produce of the fertile alluvial lands of the district. It also engages in the working up of flax, hemp and wool, milling and brewing. The town is famous in history as the site of two fateful battles for the control of the route between the river and the Mecsek mountains. In the first (Aug. 29, 1526), the Turks annihilated the Hungarian army but in the second (Aug. 12, 1687), they were decisively defeated by the Austrians. Pop. (1920) 15,864.

MOHAIR, the hair of a variety of goat originally inhabiting the regions of Asiatic Turkey of which Angora is the centre, whence the animal is known as the Angora goat.

The typical mohair fibre is 7 to 8in. long, very lustrous owing to its physical structure (which although akin to wool is different in that the wool scales are only indicated instead of being fully developed, while the fibre is always solid), $\frac{1}{800}$ to $\frac{1}{800}$ of an inch in diameter, of a soft elastic handle, and usually of a clear white transparent colour. The staples of which the fleece is formed should be uniform in length and clearly defined, naturally lending themselves to a good "spin"—a difficult attainment in the case of mohair (*see* WOOLLEN MANUFACTURE). There are many varieties of mohair, and in Constantinople, the centre of the Turkish mohair trade, a large variety of fleece is recognized.

Owing to the demand for raw material exceeding the supply, from 1820 onwards there has been a great deal of crossing of the well bred Angora with the common kind of goat: in fact, it has been said that by 1863 the original Angora had practically disappeared. The growing demand for mohair further resulted in attempts on a commercial scale to introduce the goat into South Africa—where it was crossed with the native goat—the United States, Australia, and later still New Zealand. Perhaps the introduction of the Angora into Australia and New Zealand may in part be due to its value as a scrub and blackberry browser.

The manufacture of fabrics from mohair—as in the case of alpaca and cashmere—was in the first instance due to the genius of the rearers of the goat. It would, indeed, be interesting to know if the present day mohair goods—often styled "alpacas"—really had their origin in the earlier products of Asia Minor. That fabrics of mohair were in use in England early in the 18th century is obvious from Pope's allusion:—

> "And, when she sees her friend in deep despair,
> Observes how much a chintz exceeds mohair."

Raw mohair was first exported from Turkey to England about 1820, and from that date onwards marked strides were made in its manufacture into useful yarns and fabrics. England has always had, and still maintains, supremacy in this manufacture. The larger part of both the Turkish and Cape clips is at least converted into yarn in Yorkshire mills. Quantities of these yarns are also woven into dress goods, dust cloakings, pile fabrics, imitation furs, etc., in Yorkshire, but even greater quantities of mohair yarn are exported to Russia, Germany, Austria, etc., to be converted into astrakhans, ordinary braids, brush braids, etc. In the first decade of the 20th century the mohair braid trade received a blow from the introduction of artificial silk.

The history of the introduction of the Angora goat from Asia Minor into the other countries mentioned is as follows. In 1838 pure-bred Angoras were introduced into Cape Colony. These pure-bred goats crossed with the common goat laid the basis of the Cape flocks. In 1856–57 other importations of pure-bred goats were made. From 1868 to 1897 further importations were made, but these were not of the pure-bred goat. The introduction of Angoras into the United States took place in 1849. Other importations of goats from Asia Minor were made between 1857 and 1880, and interchanges of blood also took place between the United States and Cape Colony. Between 1856 and 1875 some 300 goats were introduced into Australia. It seems that Australia may yet find the Angora goat an important asset.

MOHAMMED or **MUḤAMMAD** or **MAHOMET,** founder of the religious system called in Europe Mohammedanism, and by himself Islam or Ḥanifism. He died, according to the ordinary synchronism, on June 7, 632 (12 Rabia, A.H. 11), and his birthday was either 63 or 65 years earlier. A member of the tribe Koreish, and son of Abdullah and his wife, Aminah, Mohammed is said to have been a posthumous child who, after the early death of his mother, was brought up first by his wealthy grandfather, ʿAbd al-Moṭṭalib, and then by his poorer uncle, Abū Ṭalib. In his youth he seems to have visited the desert to acquire the habits and the language of the Bedouins, and also to have accompanied Meccan traders to Syria and south Arabia, and perhaps to Egypt and Mesopotamia. His career as a caravan conductor probably terminated with his marriage to Khadija, daughter of Khuwailid, whom tradition represents as a wealthy widow, 15 years his senior and 40 years of age at the time of the union. After his marriage, Mohammed appears to have been a partner in a shop in Mecca which sold agricultural produce.

The Prophet's Call.—Meanwhile he had acquired a reputation for great practical wisdom, though his education seems to have been only such as was normal in the case of the better families of his community. The word *ummī,* literally "popular" or "plebeian" (according to one etymology), applied to him in the Koran. is said to mean "one who can neither read nor write," a supposition which enters into the doctrine of the miraculous nature of the Koran. But the word may mean "Meccan," *i.e.,* native of "the Mother of the Villages" (*Umm al Qura*); and it is probable that he could both read and write, but unskilfully.

At the time of his aspiration to become the legislator or mouthpiece of the Deity, Arabian paganism in the north had gradually come under the Christianizing influence of the Byzantine empire, and in the south had fallen successively under Jewish, Abyssinian and Persian influence. In so far as Mohammed formulated a definite notion of his work, it was probably the restoration of the religion of Abraham, or (as the Koran calls him) Ibrahim. Though we have no reason for supposing the name of Abraham or Ishmael to have been known in Mecca generally before Mohammed's time, the biblical ethnology was not apparently questioned by those who were told of it, and there are stories, not necessarily apocryphal, of precursors of Mohammed going abroad in search of the "religion of Abraham." One feature of that system, associated in the Bible with the name of Ishmael as well, was circumcision, which was actually observed by the Meccan tribes, though with technical differences from the Jewish method; the association of monotheism with it would seem reasonable enough in view of Jewish traditions, such as Mohammed may have heard on his travels; why the doctrine of the future life should be coupled with it is less clear.

As it was obvious that the claim to be God's mouthpiece, whether directly or through the intermediary of the angel Gabriel, was to claim autocracy, Mohammed employed the utmost caution in his mode of asserting this claim. For three years his followers were a secret society; and this period appears to have been preceded by one of private preparation, the first revelation being received when the Prophet was in religious retirement—a ceremony called *Taḥannuth,* of which the meaning is uncertain, on Mt. Ḥira, near Mecca.

If the traditional dates assigned to the *suras* (chapters) of the Koran (*q.v.*) are correct, the earliest revelations to the Prophet took the form of pages or rolls which were to be read by the "grace of God." The Prophet was directed to communicate his mission at first only to his nearest relatives. The utterances were from the first a sort of rhyme, such as is said to have been employed for solemn matter in general, *e.g.,* oracles or prayers. At an early period the production of a written communication was abandoned for oral communications, delivered by the Prophet in trance; their delivery was preceded by copious perspiration, for which the Prophet prepared (in accordance with instructions found in the Koran) by wrapping himself in a blanket. Trusty followers wrote down these utterances, but the phenomena which

accompanied their delivery at least in one case suggested imposture to the scribe who apostatized in consequence. It is extraordinary that there is no reason to suppose that any official record was ever kept of these revelations; the Prophet treated them somewhat as the Sibyl did her leaves.

Certain doctrines and practices (*e.g.*, washing of the person and the garments) must have been enjoined from the first, but the doctrines to which the Prophet himself assigned most value seem to have been the unity of God and the future life.

Growth of the Early Community.—Mohammed's first converts were his wife Khadīja, his cousin Ali, and Abū Bekr, a son of Abū Quḥāfah, his most loyal disciple, and afterwards, his first successor. The early years of his work were marked by secrecy, so that when he made his first appearance as a public preacher some time about 616, he was already the head of a band of united followers.

First Period of Publicity.—Rejecting accounts of Mohammed's first appearance as a public preacher which are evidently comments on a text of the Koran, we have reason for supposing that his hand was forced by ardent followers. The astute rulers of the community perceived that the claim made by Mohammed was to be dictator or autocrat; and while this was naturally ridiculed by them, some appear to have been devoted adherents of the gods or goddesses whom he attacked. Apparently there was a war of words, followed by a resort to diplomacy and then to force; and then a period in which Mohammed's attention was directed to foreign conversions, resulting in his being offered and accepting the dictatorship of Yathrib. His increasing success led to serious persecution of his less influential followers, for whom he found a refuge in Axum. But since such an alliance was a menace to the existence of the Meccan community, a deputation was sent by the Meccan leaders to demand extradition of the exiles. To frustrate their efforts, Mohammed sent his cousin Ja'far armed with an exposition of the Prophet's doctrines afterwards embodied in the Koran as the Sura of Mary (No. XIX.; though with the addition of some anti-Christian matter). The Abyssinian king and his ecclesiastical advisers took the side of Mohammed and his followers, whom they appear to have regarded as persecuted Christians. The want of an Abyssinian chronicle for this period is a serious disadvantage for the study of Islamic origins. The sequel shows that regular correspondence went on between the exiles and those who remained in Mecca, whence the former were retained within the fold.

The Meccan leaders, roused to fury by this diplomatic victory, blockaded the Prophet and his followers in the quarter which they occupied; as in other sanctuaries, though blood might not be shed, a culprit might be starved to death. After a time the besieged found the situation intolerable and Mohammed retracted those of his utterances which had most offended the Meccans. A revelation came acknowledging the effectiveness of the Meccan goddesses as well as Allah, and the Meccans raised the siege. News of the reconciliation reached the Abyssinian exiles and before they could return the dispute had recommenced, because the Prophet had declared the revelation to be a fabrication of the Devil, who, it appears, regularly interpolates in prophetic revelations; such at least is the apology preserved in the Koran, whence the fabricated verses have been expunged. Since our knowledge of this episode (regarded as the most disgraceful in the Prophet's career) is fragmentary, we can only guess that the Prophet's hand had once more been forced by the more earnest of his followers, for whom any compromise with paganism was impossible. The exiles went back to Abyssinia; and about this time both Abū Ṭalib and Khadīja died, leaving the Prophet unprotected.

He fled to the neighbouring oasis of Ṭāif, where wealthy Meccans had possessions, and opened negotiations with various Meccan magnates for a promise of protection in case of his return. This was at last obtained from one Mot'im b. 'Adi.

The Flight to Yathrib.—Avoided by the Meccans, he was glad to accept an invitation from the inhabitants of Yathrib, afterwards known as *al-Medina*, Medina, "the City" (*i.e.*, of the Prophet), to come thither as dictator, to heal the feud and restore order. Accordingly he exiled himself and his flight *hijra* (anglicized incorrectly *hejira*, *q.v.*), initiated the Mohammedan era, July 16, A.D. 622. The new converts were told to carry on secret propaganda in Yathrib with this end in view. A trusty follower of Mohammed, Mus'ab b. 'Umair, who resembled him in appearance, was sent to Yathrib to assist in the work.

Although the transactions with the people of Yathrib had been carried on with profound secrecy, the nature of Mohammed's contract with his new adherents was somehow divulged to the Meccan magnates, and the danger of allowing an implacable enemy to establish himself on the high-road of their north-bound caravans flashed upon them. The rule which forbade bloodshed in the sacred city had at last to be suspended; but elaborate precautions were to be taken whereby every tribe (except Mohammed's own clan) should have their share in the guilt, which would thus be spread over the whole community fairly. When the committee appointed to perpetrate the crime reached Mohammed's house, they found that it was too late; Mohammed had already departed, leaving Ali in his bed.

Accompanied by Abū Bekr only, Mohammed took refuge in a cave of Mt. Thaur. The date at which he reached Kuba, on the outskirts of Yathrib, is given as 8 Rabia I., of the year A.H. 1; the fact that he arrived there on the Jewish Day of Atonement gives us the date Sept. 20, 622.

Mohammed as Despot of Yathrib.—The safe arrival of Mohammed at his destination marks the turning-point in his career, which now became one of almost unbroken success; by defeat little less than by victory. His policy appears to have been to bind his followers to himself and then to each other by every possible tie; he instituted brotherhoods between the Refugees and Helpers, which were to count as relationships for legal purposes, and having himself no sons, he contracted numerous marriages partly with the same end in view; *e.g.*, with the infant daughter of Abū Bekr, Ayesha ('A'ishah), whose ability he appears to have discerned; and the unamiable Ḥafṣa, daughter of Omar. Of his own daughters three were given to faithful allies, the one by whom his line is supposed to have been continued to our time, Fāṭima, was reserved for his cousin. Coming in the capacity of the prophet of the Israelitish God, Mohammed at first seems to have courted alliance with the Jews, but finding no possibility of compromising with them on religious questions or of obtaining their loyal support, he seems to have reacted towards paganism, and after about a year's residence at Medina the direction of prayer, which till then had been towards Jerusalem, was turned southward to the pagan temple at Mecca. With this change we may perhaps couple the adoption of the name *Allah* for the Deity. In general any practice taken over from some other sect was modified so as to render the Muslim method absolutely distinct; but on the subject of food Mohammed was satisfied with the regulations of the Council of Jerusalem, recorded in Acts xv., which were observed by few, if any, Christian sects. The prohibition of wine, which was enacted in A.H. 3, is said to have been occasioned by the riotous conduct of one of his followers when under the influence of liquor. As the system spread outside of Medina both conversion to Islam and persistence therein were reduced to simple tests; the pronunciation of the double formula of belief in Allah and Mohammed was sufficient to indicate conversion, whilst payment of an income-tax was evidence of loyalty.

The Campaigns of Mohammed.—The industries in which the Meccan refugees had been engaged were not of a sort which they could exercise at Medina, and hence a fresh source of revenue was sought in the attacking of Meccan caravans. After a year of futile attempts, Mohammed resolved to send an expedition to attack a caravan at the beginning of the sacred month of Rajab, a season when raiding was unknown among the Arabs. The violation of the sacred month seems to have caused considerable scandal in Arabia, but led to no serious consequence; on the other hand the shedding of blood created a feud between the Meccans and the refugees, whom they declined to identify with the people of Medina. Some months later another attack for which the Prophet had organized a party of some 300 men

led to the battle of Badr (Ramaḍān 19, A.H. 2, usually made to synchronize with March 17, 624) in which the Meccans numbering about a thousand were badly defeated. The day is called in the Koran by a Syriac expression the "Day of Deliverance," and both for internal and external politics was of incalculable advantage to Islam, whilst Mohammed in the popularity acquired by his victory was able to strike forcibly at his enemies in Medina.

The defeat at Badr naturally led to efforts on the part of the Meccans to avenge their dead and besides to secure the commerce by which they lived, from an enemy who was gradually getting all the seaboard that lay between Jeddah and Yanbo within his sphere of influence; and the year after Badr (A.H. 3), when Abū Sofiān led a force of some 3,000 men against Medina itself, part of it was under Khālid b. al-Walid, one of the greatest of Arab captains, afterwards conqueror of Syria. A battle was fought under Mt. Uḥud (or Ohod), north-west of Medina, wherein Mohammed's forces were defeated. The Meccans considering their task finished when they had killed as many as those who had fallen at Badr on their own side, instead of pursuing their victory went home. Two years later, they, with their allies, the tribes Fazarah, Asad, Murrah, etc., to the number, it is said, of 10,000, attempted to stamp out Islam, but Mohammed resorted to the expedient of defending his city by a trench and employed agents to sow dissension among the confederates. After a brief stay and scarcely striking a blow, the confederacy dispersed.

The next year (A.H. 6), Mohammed made a truce with the Meccans (the truce of Ḥodaibiyah), whereby he secured for his followers the right of performing the pilgrimage in the following year. The performance of the pilgrimage (A.H. 7), not only won important converts in the persons of Khālid and the no less able 'Amr b. al-'As, but in general impressed the population with the idea that Mohammed was winning. An excuse was easily found for invading Mecca itself in the following year and the city surrendered with little resistance. The Medinese, however, prevailed upon the Prophet to maintain their city as his political capital, while making Mecca the religious centre of his system. In the following year all Arabs who were not yet converted were given four months' grace before force was to be brought to bear upon them. In the succeeding year Mohammed himself conducted the pilgrimage, and delivered the important proclamation wherein he declared that God had completed their religion. The principle insisted upon was the brotherhood of Islam; but there is difficulty in enucleating the original sermon from later additions.

It would seem that at first Mohammed thought of himself as sent to his fellow-citizens only, but at the battle of Badr he appears to have formulated the rule that no one might fight on his side who had not embraced Islam; and when once he had won fame as a successful campaigner, those who wished to share his adventures had to pass the Islamic test. After the taking of Mecca, paganism in general was conscious of being attacked; and the city had scarcely been brought under the new régime before the Prophet had to face a confederation of tribes called Hawāzin and Thaqīf. The battle which ensued, known as the Day of Honain, was a narrow victory for Islam. Emissaries were now sent out to destroy idols, and only Ṭāif appears to have made any considerable resistance; against this place the Prophet first made use of siege artillery, and afterwards took it by capitulation.

Although the central portions of the peninsula were practically independent, large portions of the north-west and south-east were provinces of the Byzantine and Persian empires respectively, whence any scheme for the conquest of Arabia would necessarily involve war with these great powers. In the year A.H. 7, on the eve of the taking of Mecca, the Prophet sent missives to all known sovereigns and potentates, promising them safety if they embraced Islam. The text of these letters, which only varied in the name of the person addressed, is preserved (doubtless faithfully) by the Muslim Oral Tradition. At the time of his death he was organizing an expedition against Syria.

The Jewish and Christian Communities.—The Prophet claimed throughout that his revelation confirmed the Jewish and Christian Scriptures, and on neither the truth of the Biblical history and miracles nor the validity of the Mosaic legislation does he appear to have cast any doubt. He even allows that Israel was the chosen people. The Gospel was known to him chiefly through apocryphal and heretical sources, which cannot certainly be identified; but he accepted the doctrine of the Virgin-birth, the miracles of healing the sick and raising the dead, and the ascension; the crucifixion and resurrection were clearly denied by the sect from whom he had received his information, and rejected by him, though certainly not because of any miracle which the latter involved. His quarrel with the Jews at Medina appears to have been by no means of his own seeking, but to have arisen unavoidably, owing to his particular view of his office being such as they could not accept. When he discovered their military incompetence he appears to have been unable to resist the temptation to appropriate their goods; and his attack on the flourishing Jewish settlement of Khaibar appears to have been designed to satisfy his discontented adherents by an accession of plunder. Yet the consciousness that his process was economically wasteful suggested to him an idea which Islamic States are only now abandoning, viz., that of a tolerated caste who should till the soil and provide sustenance for the Believers who were to be the fighting caste. Whereas then his former plan in dealing with Israelites had been to banish or massacre, he now left the former owners of Khaibar (who had survived the capture of the place) in full possession of the soil, of whose produce they were to pay a fixed proportion to the Islamic State.

Disputes with Christians occur somewhat later in the Prophet's career than those with the Jews. Mohammed's manifesto to the world, about the time of the taking of Khaibar, appears to represent his definite breach with Christianity; and when in the "year of the embassies" the Christians of Najran sent a deputation to him, they found that the breach between the two systems was not to be healed. Of the three alternatives open to them—conversion, internecine war, and tribute—they chose the last, and the Prophet's attitude towards them became less hostile than towards the Jews.

Mohammed's Administrations and Reforms.—The financial requirements of Mohammed's state were of the simplest kind, for there is no trace of any governmental department having been instituted by him. As despot of Medina he combined the functions of legislator, administrator, general and judge; his duties in the last three capacities were occasionally delegated to others, as when he appointed a governor of Medina during his absence, or leaders for expeditions. The newly converted communities he left to manage their internal affairs as before, only sending occasional envoys to discharge special duties, especially instruction in the Koran and the principles of Islam and to collect the *Alms:* quite towards the end of his life he appears to have sent persons to the provinces to act as judges.

What afterwards proved the main source of revenue in Islamic States dates from the taking of Khaibar; for the rent paid to the State by tolerated communities for the right to work their land developed long after Mohammed's time into a poll-tax for Unbelievers (*see* CALIPHATE, and MOHAMMEDAN INSTITUTIONS), and a land-tax for all owners of land. Of the Prophet's reforms the three most important were his attempt to break down the blood-feud or system of tribal responsibility for homicide, whereby one death regularly led to protracted wars; his abolition of infanticide, which is condemned even in early Suras of the Koran; and, if tradition be right, the granting to women of the right to inherit property. The "Condition of Islam" whereby adultery was forbidden is said to have been ridiculed at the time, on the ground that this practice had never been approved. Against these services we must set the abrogation of some valuable practices. His unfortunate essay in astronomy, whereby a calendar of twelve lunar months, bearing no relation to the seasons, was introduced, was in any case a retrograde step. He also permitted himself a slight amount of bloodshed in Mecca itself, and that city perhaps never quite recovered its sacrosanct character. Of more serious consequences for the development of the community was his encouragement of the shedding of kindred blood in the cause

of Islam; his assassinations of enemies were afterwards quoted as precedents. No less unfortunate was the recognition of the principle whereby atonement could be made for oaths.

Mohammed's Domestic Life.—The Prophet's domestic troubles, to which an unreasonable amount of space seems to be devoted, even in the Koran, began after the Migration, when, probably for political reasons, he instituted a royal harem. One of these political motives was the principle which long survived, that the conquest of a state was consummated by possession of the former monarch's wife or daughter; another, as had been seen, the desire to obtain the securest possible hold on his ministers. Of the members of this harem the only prominent one is 'A'isha, married to the Prophet shortly after the Flight, when she had scarcely passed the period of infancy, but who appears to have been gifted with astuteness and ambition that were quite beyond her years, and who maintained her ascendancy over the Prophet in spite of the fact that many carping criticisms of his revelations are attributed to her. In her arms apparently he died, and on her statements we have to rely for what we know of his last hours.

The traditional description of Mohammed is "of middle height, greyish, with hair that was neither straight nor curly; with a large head, large eyes, heavy eyelashes, reddish tint in the eyes, thick-bearded, broad-shouldered, with thick hands and feet." He was in the habit of giving violent expression to the emotions of anger and mirth, and during his last years exhibited great physical and intellectual activity.

Chronological Table of Chief Events in the Life of Mohammed[1].

570. Birth.
595. Marriage with Khadīja.
610. Commencement of Call.
613. Public Appearance.
616. Persian conquest of the nearer East.
? 617. Flight of his followers to Abyssinia.
? 618–619. Siege in Mecca. Retractation and subsequent repudiation. Death of Abū Ṭalīb and Khadīja.
? 620. Flight to Ṭāif.
622. July 16. Beginning of the Muslim era.
622. Sept. 20. Arrival at Kuba after the Flight.
632. Jan. 27. Death of his son Ibrāhīm.
June 7. Death of Mohammed.

Family of Mohammed[1].—*Wives:*—**Khadīja* (Children:—Qāsim; ? 'Abd Manāf [Ṭāhir, Tayyib]); **Zainab* m. Abu'l-'As b. Rabī', d. A.H. 7; **Ruqayyah,* m. 'Othmān b. 'Affān, d. A.H. 2; **Umm Kulthūm* m. 'Othmān b. 'Affan, d. A.H. 9; **Fāṭimah,* m. 'Alī, d. A.H. 11; *Saudah bint Zam'ah.* ? d. A.H. 54, **'A'ishah (Ayesha) bint Abī Bekr* (d. A.H. 56), **Ḥafṣa bint 'Omar* (d. A.H. 45 or 47), *Zainab bint Khuzaimah* d. before A.H. 11, **Zainab bint Jaḥsh,* d. A.H. 20, **Umm Salimah,* d. A.H. 59, **Maimūnah,* d. A.H. 38, **Juwairiyah,* d. A.H. 56, **Umm Ḥabībah Ramlah bint Abī Sofiān,* d. A.H. 44.

Concubines:—**Ṣafiyyah bint Ḥuyyay,* d. A.H. 36, **Raiḥānah bint Zaid,* **Māriyah the Copt.* d. A.H. 15 or 16, mother of Ibrāhīm. (Other names given by Ibn Sa'd, vol. viii.)

Sources.—The literary matter ascribed to the Prophet consists of (1) the Koran (*q.v.*); (2) certain contracts, letters and rescripts preserved by his biographers; (3) a number of sayings on a vast variety of topics, collected by traditionalists. The references in the Koran to a form of literature called "Wisdom" (*ḥikmah*) suggest that even in the Prophet's time attempts had been made to preserve some of the last; the general uncertainty of oral tradition and the length of time which elapsed before any critical treatment of it was attempted, and the variety of causes which led to the wilful fabrication of prophetic utterances, render the use to which No. 3 can be put very limited. It is very much to be regretted that the number of *pièces justificatives* (No. 2) quoted by the biographers is so small, and that for these oral tradition was preferred to a search for the actual documents, some of which may well have been in existence when the earliest biographies were written. Besides these contemporary documents many events were celebrated by poets, whose verses were ostensibly incorporated in the standard biography of Ibn Isḥāq; but in the abridgment of that biography which we possess many of these are obelized as spurious; the *diwan* (or collection of poems) attributed to Ḥassan b. Thābit, however, is ordinarily regarded as authentic. Though they rarely give detailed descriptions of events, their attestation is at times of value, *e.g.,* for the story that the bodies of the slain at Badr were cast by the Prophet into a pit. Besides this, the narratives of eye-witnesses of important events, or of those who had actually taken part in them, were eagerly sought by the second generation, and some of these were committed to writing well before the end of the 1st century. The procedure whereby the original dates of the events (so far as they were remembered) were translated into the Muslim calendar—for something of this sort must have been done—is unknown, and is unlikely to have been scientific.

[1]Dates are given A.H.

* is prefixed to names which figure on occasions that seem to be historical. Female names are in italics.

BIBLIOGRAPHY.—The biography of Ibn Isḥāq had circulated long before the two chief causes for the falsification of tradition had begun to have serious effects; these were the need for legal precedents, and the concept of saintliness, which gave rise to the classical works on the *Evidences of Mohammed's Mission* by Abū Nu'aim (d. A.D. 1012–13) and Baihaqī (d. A.D. 1066).

Lives of the Prophet († indicates that the work is lost): †'Urwah b. Zubair (d. 712–713); Musa b. 'Ukbah (d. 758–759); †Mohammed b. Isḥāq (d. 768); Mohammed b. Hishām (d. 828–829), ed. Wüstenfeld (Göttingen, 1860); reprinted in Egypt by Zubair Pasha, a series of excerpts from the last; Mohammed b. Omar al-Wāqidī (d. 823), portion published by Kremer (Calcutta, 1855), abridged trans. of a fuller copy by Wellhausen, *Muhammad in Medina* (Berlin, 1882); Mohammed b. Sa'd (d. 844–845), an encyclopaedic work on the history of Mohammed and his followers, called *Ṭabaqat,* ed. Sachau and others (Berlin, 1904–12, incomplete); Mohammed b. Jarīr al-Ṭabarī (*see* TABARĪ). Other writers are enumerated in the *Fihrist, cf.* Sprenger's *Leben Muhammads,* iii.

Modern Authorities: The critical study of Mohammed begins in Europe with the publication by Th. Gagnier in 1723 of the *Life* by Abulfeda (*q.v.*). Presently there appeared an apologetic biography by Henri Cmte. de Boulainvilliers (2nd ed., Amsterdam, 1731), to which Gagnier replied in 1732 (*La Vie de Mahomet, traduite,* etc., *ibid.*). Then came the biography of G. Weil (*Muhammed der Prophet,* Stuttgart, 1843), without religious bias; the popular life by Washington Irving (London, 1849) is based on this. That by J. L. Merrick (*The Life and Religion of Mohammed,* Boston, 1850) rests on Shi'ite sources. The search for mss. in India conducted by A. Sprenger led to the discovery of fresh material, which was utilized by Sprenger himself in his unfinished *Life of Mohammed* (Pt. 1, Allahabad, 1851), and his more elaborate *Das Leben und die Lehre des Mohammed* (1861–65), and by Sir William Muir in his *Life of Mahomet* (London 1858–61), 4 vols.: afterwards abridged in one volume and reprinted. The biography by S. W. Koelle, *Mohammed and Mohammedanism* (1889), is pro-Christian, the popular work of Syed Ameer Ali, *The Spirit of Islam* (1896), an apology for Mohammedanism. The more notable later works include H. Grimme's *Mohammed* (Münster, 1892, and Munich, 1904); F. Buhl's *Mohammeds Liv* (Copenhagen, 1903—Danish; since translated into German); A. N. Wollaston's *Muhammad, His Life and Doctrines* (1904); D. S. Margoliouth, *Mohammed and the Rise of Islam* (N.Y., 1905, etc.); Prince Caetani, *Annali dell' Islam,* i., ii. (Milan, 1905–07); and J. T. Andrae, *Die Person Muhammeds in Lehre und Glauben seiner Gemeinde* (Stockholm, 1917).

(D. S. MA.; X.)

MOHAMMED V. (1844–1918), Sultan of Turkey, was born at Topqapu on Nov. 3, 1844, a younger son of the Sultan Abdul Majid (1823–1861). He led a quiet and retiring life, and suffered at times considerably from the jealousy and suspicion of his elder brother, the Sultan Abdul Hamid II. On the deposition of Abdul Hamid he was invested as caliph (May 10, 1909). He was, for the most part, merely a tool in the hands of the Committee of Union and Progress and, though he was supposed to dislike the pro-German policy of Enver Pasha, he was unable to take any effective steps to oppose him. He died at Yildiz on July 3, 1918, and was succeeded by his brother Vahid-ed-Din (1861–1926) as MOHAMMED VI. Mohammed VI., the last sultan of Turkey, left Constantinople Nov. 17, 1922, on a British battleship, was declared deposed Nov. 23, and died in exile.

MOHAMMED AHMED IBN SEYYID ABDULLAH (1848–1885), Sudanese tyrant, known as "the Mahdi," was born in Dongola. His family, known as excellent boat-builders, claimed to be *Ashraf* (or *Sherifs*), descendants of the Prophet. His father was a *fiki* or religious teacher, and Mohammed Ahmed devoted

himself to religious studies. He went to live on Abba Island on the White Nile about 150 m. above Khartum; many dervishes gathered round the young sheik, whose reputation for sanctity speedily grew. He travelled secretly through Kordofan, where (with ample justification) he denounced to the villagers the extortion of the tax-gatherer and told of the coming of the mahdi who should deliver them from the oppressor. In May 1881 a certain Abu Saud, a notorious scoundrel, was sent to Abba Island to bring the sheik to Khartum. Abu Saud's mission failed, and Mohammed Ahmed no longer hesitated to call himself Al-Mahdi al Montasir. "The Expected Guide." In August he defeated another force sent to Abba Island to arrest him, but thereafter deemed it prudent to retire to Jebel Gedir, in the Nuba country south of Kordofan, where he was soon at the head of a powerful force; and 6,000 Egyptian troops under Yusef Pasha, advancing from Fashoda, were nearly annihilated by him in June 1882.

By the end of 1882 the whole of the Sudan south of Khartum was in rebellion, with the exception of the Bahr-el-Ghazal and the Equatorial Provinces. In January 1883 El Obeid, the capital of Kordofan, was captured. In the November following Hicks Pasha's force of 10,000 men was destroyed at Kashgil, and in the same year the mahdi's lieutenant, Osman Digna, raised the tribes in the eastern Sudan, and besieged Sinkat and Tokar, near Suakin, routing General Valentine Baker's force of 2,500 men at El Teb in February 1884. The operations undertaken by Great Britain in face of this state of affairs are narrated under EGYPT: *Military Operations*. It need only be added that General Gordon (*q.v.*) was besieged at Khartum by the mahdi and was killed there when the town was captured by the mahdists on the 25th–26th of January 1885. The mahdi himself died at Omdurman on June 22, 1885, and was succeeded by his khalifa Abdullah.

See *Mahdiism and the Egyptian Sudan* by F. R. Wingate (1891); *Ten Years' Captivity in the Mahdi's Camp* (1882–92) from the MS. of Father Joseph Ohrwalder by F. R. Wingate (1892) and *Fire and Sword in the Sudan* (1879–95) by Slatin Pasha.

MOHAMMED ALI (1769–1849), founder of the present royal house of Egypt, born at Kavala, a small seaport on the frontier of Thrace and Macedonia. His father, an Albanian, was an *aga*, a small yeoman farmer, and he himself began life as a petty official and trader in tobacco. In 1798 he became second in command of a regiment of bashi-bazouks, or volunteers, recruited to serve against Napoleon in Egypt. He took part in the battle of Aboukir (July 25, 1799), was driven into the sea with the Turks, and was saved from drowning by the gig of the British admiral. In 1801 he returned to Egypt, in command of his regiment, and on May 9 distinguished himself at the battle of Rahmanieh. In the years that followed, Mohammed Ali, leader of a compact body of Albanian clansmen, was in the best position to profit by the struggle for power between the Mamelukes and the representatives of the Porte. In 1803 he cast in his lot with the former; in 1804 he turned against them and proclaimed his loyalty to the sultan; in 1805, the sheiks of Cairo, in the hope of putting a stop to the intolerable anarchy, elected him pasha, and a year later an imperial *firman* confirmed their choice. The disastrous British expedition of 1807 followed; and while at Constantinople the prestige of the sultan was being undermined by the series of revolutions which in 1808 brought Mahmud II. to the throne, that of Mohammed Ali was enhanced by the exhibition at Cairo of British prisoners and an avenue of stakes decorated with the heads of British slain.

In spite of his chance victories, however, he was too shrewd not to see the superiority of European methods of warfare; and as the first step towards the empire of which he dreamed he determined to create an army and a fleet on the European model. In 1808 the creation of the navy was begun with the aid of French officers and engineers. In 1811 the massacre of the Mamelukes left Mohammed Ali without a rival in Egypt, while the foundations of his empire beyond were laid by the war against the Wahhābīs and the conquest of the holy cities of Mecca and Medina. The Wahhābī War indeed dragged on till 1818, when Ibrahim (*q.v.*), the pasha's son, who in 1816 had driven the remnant of the Mamelukes into Nubia, brought it to an end. This done, the pasha turned his attention southward to the vast country watered by the Upper Nile. In 1820 the oasis of Siwa was subdued by his arms; in 1823 he laid the foundations of Khartum.

By this time Mohammed Ali was the possessor of a powerful fleet and of an army of veterans disciplined by European officers. To obtain these money had been necessary; and in order to raise money the pasha instituted internal "reforms"—a bizarre system of state monopolies and showy experiments in new native industries (*see* EGYPT: *History*). The viciousness of these expedients was, however, only gradually revealed, and Mohammed Ali seemed at once the most enlightened and the most powerful of the sultan's valis. To Mahmud II., whose whole policy was directed to strengthening the central power, this fact would have sufficed to make him distrust the pasha and desire his overthrow; and it was sorely against his will that in 1822, the ill-success of his arms against the insurgent Greeks forced him to summon Mohammed Ali to his aid. The immediate price was the pashalik of Crete; in the event of the victory of the Egyptian arms the pashaliks of Syria and Damascus were to fall to Mohammed Ali, that of the Morea to his son Ibrahim. The part played by Mohammed Ali in the Greek War is described elsewhere (*see* EASTERN QUESTION, TURKEY: *History*; GREECE: *History*; GREEK INDEPENDENCE, WAR OF; IBRAHIM). The intervention of the Powers, culminating in the shattering of the Egyptian fleet at Navarino (*q.v.*), robbed him of his reward so far as Greece was concerned; the failure of his arms in spite of this intervention gave Sultan Mahmud the excuse he desired for withholding the rest of the stipulated price of his assistance.

This disappointment would not perhaps in itself have sufficed to stir Mohammed Ali to revolt; but it was ominous of perils to come, which he thought it wise to forestall. In the spring of 1831 two pashas, Hussein of Bosnia and Mustafa of Scutari, had succumbed to the sultan's arms; and, since he was surrounded and counselled by the personal enemies of the pasha of Egypt, it was likely that, so soon as he should feel himself strong enough, he would deal in like manner with Mohammed Ali. It was to anticipate this peril that Mohammed Ali determined himself to open the struggle. On Nov. 1, 1831, his troops crossed into Syria.

Wild rumours went abroad as to his intentions. He was master of the holy cities, and the official *Moniteur Ottoman* denounced his supposed plan of aiming at the caliphate in collusion with the sherīf of Mecca. As for the pasha himself, he loudly disclaimed any such disloyal pretensions; his aim was to chastise Abdulla, pasha of Acre, who had harboured refugees from his "reforms"; to overthrow Khusrev, who had encouraged him in his refusal to surrender them; to secure the fulfilment of the sultan's promise with regard to Syria and Damascus. Mahmud, on the other hand, was torn between hatred of the pasha and hatred of the Christian Powers which had forced him to make concessions to the Greeks. Voices urged him to come to terms with Mohammed Ali, secure peace in Islam, and turn a united face of defiance against Europe; and for a while he harboured the idea. In the end, however, his pride prevailed; in April 1832 the Turkish commander-in-chief Hussein Pasha left Constantinople for the front; and in May the ban of outlawry was launched against Mohammed Ali.

The events which followed during the next ten years, and their effect on the international situation belong to the history of the Eastern Question (*q.v.*). So far as Mohammed Ali's own fortunes were concerned, the Convention of Kutayah (April 8, 1833), which closed his first successful war with the Porte, gave him the objects of his immediate ambition; and, though still nominally only the sultan's representative, he ruled an empire stretching from Khartum to the borders of Anatolia. Had he been as wise as a ruler as he was astute as a diplomatist, he might have consolidated his power. But the peoples who had welcomed him as a deliverer soon found his yoke more intolerable than that of the Turk; the Syrians broke into revolt in 1834, and four years later it was an insurrection of the Arabs of the Hauran which served as the pretext for the war which Sultan Mahmud opened against him. Again the Egyptian arms were victorious, but the intervention of the Powers robbed Mohammed Ali not only of the spoils of his most recent victories, but also of those secured in

1833, and in the end he had to be content with the hereditary pashalik of Egypt and the government of Nubia, Darfur, Kordofan, and Sennaar, conferred upon him by *firmans* of the sultan in 1841. With this Mohammed Ali passes from the stage of history. He was an old man; his mind was soon to give way; and for some time before his death on Aug. 2, 1849, the reins of power were held by his son and successor Ibrahim. See *Cambridge Modern History*, vol. x., ch. xvii.

MOHAMMEDAN ARCHITECTURE. When in a victorious advance the Arab followers of Mohammed subdued the old civilized nations of Asia and Africa, Persians, Turks, Byzantines, Syrians and Copts, their own civilization was not yet much developed and in many respects dependent on those of the neighbouring countries; but the greater was their faith in the one God, inimical to every kind of idolatry. The architecture of the Mohammedan world, therefore, was created by members of those overthrown peoples who were clients of the Arabs or had themselves turned Muslim, and the characteristic Mohammedan style of architecture originated in the fact that in the unitary civilization of Islam the earlier styles, till then kept separate by national antipathies, were fused into a new oneness.

In the Mohammedan world ecclesiastical and aristocratic buildings, such as mosques, monasteries, mausoleums, palaces and castles, greatly predominate. Middle-class architecture is known only from a few excavations. The mosque (*masjid*) is the most original creation of the Mohammedan genius, and the most commonly encountered; consequently it offers the best means of studying the development of architectural style. Both the non-Christian places of worship and the Christian churches, with their concentration on a holy-of-holies, altar or the like, were too reminiscent of image-worship or idolatry. Mohammed therefore took a simple assembly-room (*musalla*), with a flat roof supported on pillars, as the place for the public Friday prayer; a niche resembling a door (*mihrāb*) showed the direction (towards Mecca) in which the congregation had to prostrate themselves when praying, while a pulpit (*minbar*) was used by the preacher and leader in prayer, and a superstructure on the roof (minaret) by the summoner to prayer. The first mosques in the great camps in Mesopotamia, Syria and Egypt, such as Kufa and Old Cairo, were also on this plan, but on an immense scale, and in many cases the nave was drawn parallel to the *mihrāb*-wall, so that the faithful could come to prayer in the same ranked formation in which they went forth to battle against the unbelievers.

'Omayyad Style.—When the Beduin victors embraced a sedentary life in the conquered lands of civilization, the Spartan communism that had prevailed gave way to private economy and luxury, and the wooden mosques of the earlier period were replaced by magnificent structures of stone. It is true that in Damascus, the capital, the church of St. John erected by the Byzantine emperor Justinian was simply taken over and used as the chief mosque, while in Jerusalem the church of St. Mary became the Aqsa mosque, and so in other instances; but over the rock at Jerusalem from which the angel Gabriel was said to have carried the prophet through the heavens in a dream, an octagonal domed building mostly in the Byzantine style (*see* Byzantine and Romanesque Architecture), the Dome of the Rock, was erected, with the smaller Qubbat-as-Silsila beside it. Except in such instances, however, existing clay walls were replaced by stone, and wooden pillars by stone columns; examples may still be seen in the 'Amr mosque (erected in 642, rebuilt in 827 and 1329) and the al-Azhar in Old Cairo. The columns were taken from the ruins of Roman temples and Christian churches, but later the Mohammedans themselves imitated their acanthus capitals and joined them with round arches; the walls were ornamented with marble tablets, and with inscriptions and foliate work in Byzantine glass-mosaic.

Moorish Style in Spain and North Africa.—After the fall of the 'Omayyads (A.D. 750), this style disappeared from the East, but in the West, where in 756 the 'Omayyad 'Abd-ar-Rahmān founded a kingdom of his own, it soon began to develop on separate lines, and is still a living force. The earliest examples are the Sidī Oqba mosque at Qairuān, begun in 670 and rebuilt in the 9th century, and the az-Zitūna mosque at Tunis. In this period the hall of the mosque is prefaced, as also in the East, by a courtyard surrounded by a colonnade; it contains water-basins in which the faithful could perform their ablutions in preparation for prayer, and a lofty quadrangular tower, receding in the last third of its height, serves as minaret. Farther on the first nave rises above the others, and that part of it which lies opposite the *mihrāb*, with the chieftain's lodge (*maqsūra*), is crowned with a cupola; from that point another longitudinal nave, also higher than the rest, runs to the front of the courtyard, where a second domed space forms a kind of portal. The immense mosque of Córdoba (8th to 10th century) illustrates this type in its perfection. Horseshoe arches of alternate brick-red and white keystones rested on slender pillars, and above them rose a second storey of round arches of the same composition, supporting the original cedarwood ceiling. In the *maqsūra*, richly-decorated lobar arches, intercalated between the horseshoe arches, ran above the *mihrāb* so as to form a blind arcade, and ultimately continued the wall-square of the *maqsūra* up into the octagon, where the dome sprang from two intersecting quadrangles of arches. The *mihrāb* itself was still adorned with Byzantine glass-mosaic, but elsewhere this form of decoration was superseded by the stucco arabesque—borrowed, like the rich carvings on the *minbar* and the faïence tiling on the *mihrāb* at Qairuān, from the 'Abbāsid art of the East. This plan, with its slender stone pillars, horseshoe and lobar arches, tiling and stucco arabesques, in later centuries was carried on into a graceful style, a kind of Maghrebine rococo and remains the distinctive characteristic of all Moorish and Mudejar art in Spain till the 16th century, in Morocco and—with an admixture of Ottoman elements—in Algiers and Tunis down to the present day.

'Abbāsid Style.—The new dynasty of the 'Abbāsid caliphs, which founded Baghdad (762) and also Sāmarrā (836), drew its chief support from the Arabs of Mesopotamia and the Persians of Khorasan, and later from Persianized Turkish mercenaries. In those countries, however, since the days of the Babylonian and Persian civilizations, building had been done mainly with bricks that were merely air-dried; these were often covered with coloured glazed bricks of the same nature (Assur, Babylon, Susa). Moreover, on account of the shortage of building-timber and large ashlar, the vaulted style throve exceedingly, taking the form of the pointed arch, the ogee arch, and the dome on a circular tambour, led up to at the angles of the walls by small conical vaults (trompe-vaults). As, however, the disposition of the available spaces was strictly limited by the necessity of equilibrating the thrust of the vault, the shape of the building tended to be very irregular, and this had to be corrected by sham façades. In the mosques of the 'Abbāsid period; *e.g.*, the great Mosque and the Abū Dilif at Sāmarrā, the Ibn Tūlūn mosque at Cairo, the mosque of Raqqā, etc., the plan previously customary was followed, but the pillars were replaced by thick columns with small false pillars at the angles, joined together by pointed arches, but the first named mosque did not yet possess arches. The panels of wall between them, framed by moulded stucco friezes, were discharged by similar, but smaller, arched windows, as were the intervals between the windows in the crenellated outer walls. Owing to the small supporting power of the bricks, the minarets were massive, and were ascended by a spiral staircase.

Perso-Turkish Style.—On the downfall of the 'Abbāsid caliphate and its supersession, first by Turkish "mayors of the palace," then by independent Turkish dynasties in Egypt and Syria, Mesopotamia, Asia Minor and Persia, India and Turkestan, the older architectural styles were entirely supplanted by the Persian vaulted style, except in north Africa. Rapidly increasing in number through pious foundations, the mosques had no longer to shelter such large congregations, and a new, purely Persian type,—nearly always established in connection with a theological college (*Madrasa*)—gained chief favour. In this style the courtyard, used for ablutions but also for prayer, is surrounded not by pillared halls, but by two-storied arcades, behind which lie the monastic cells of the teachers and students; from the middle of each side, however, runs an immense hall, open to the front and

roofed with a vault of ogee arches. Each of these halls serves as a lecture-room for one of the four faculties in theology and law, and one of them contains the *mihrāb* and the *minbar*. These *īwāns*, which are often twice as high as the adjacent parts of the building, are further emphasized by rectangular façades, splendidly ornamented and flanked by small minarets. A similar but slightly shorter *īwān* serves as gateway, and indeed the main *īwān* itself is generally also the entrance to the space behind it. This latter is crowned with a dome, narrowed in at the bottom, and contains the founder's tomb or the *mihrāb*. With their slender minarets, their magnificent *īwāns* and gateways, and their lofty domes (often gilded), these mosques are among the most astonishing buildings of the East, the more so because their walls are almost always overlaid with a mosaic of dull or glazed bricks and faïence plaques in glowing colours, arranged in lines of monumental and cursive script, and with flower-arabesques recalling tapestry and anglepillars going up into rope-like tori, while golden "stalactites," *i.e.*, rows of consoles projecting corbelwise one beyond the next, stand out from niches and under cornices and balconies. Unfortunately these fairy-tales from the *Arabian Nights* are now almost all in a sad state of dilapidation. The most celebrated are the Blue Mosque at Tabriz, the Masjid-i-Shāh at Mashad, the gigantic *madrasas* of Tamerlane at Samarcand, all of the 15th century; others, incorporated in older pillar-mosques or adapted to their plan and purpose, are the Great Mosque of Veramin (1322), that of Isfahan (11th–14th centuries), the sepulchral mosque of the Imām Rizā at Mashad (1418), and the Masjid-i-Shāh at Isfahan (*c.* 1600).

The dome of the *īwān* mosque was originally developed in another architectural type, the mausoleum. Reaching back to old Persian traditions, a favourite form of princely tomb in Persia from the 10th to the 14th century was the sepulchral tower with a circular or polygonal ground plan, the classical examples of which resemble petrified nomad huts. A conical roof rested on a stalactite cornice, beneath which a band of inscriptions gave the name and titles of the deceased, and below a second row of stalactites or an overhanging penthouse the wall of the tower descended straight, or in vertical ripples like folds of stuff, or in architectonic gate-like arrangements like tent-openings. The finest mausoleum of this kind is that of Mumine Khātūn at Nakhichevān (Armenia), erected in 1186. In various sepulchral buildings, such as that of Harun-al-Rashid's wife Zobeide at Baghdad, we may remark the transition to the second type. Here the space set apart for the sarcophagus is surrounded by galleries with ogee arches on a quadrangular or octangular ground-plan, the bulbous and often pointed domes being raised on a tambour above the rest of the building, and flanked by minarets. Examples may be seen in the mausoleum of Sultan Sanjar at Merv (1157), that of the Mongol Uljaitū Khodābanda at Sultānīya (1316), those of Tamerlane and his family at Samarcand (15th century), etc.

Mameluke Style.—In Egypt and Syria the anti-caliphs of the Fatīmid house, who came immediately from Africa, but ultimately from Persia, had already transformed the 'Abbāsid pillar-mosque in stone (Hākim Mosque, Cairo, 996). The Ayyūbids (1169–1250) and Mamelukes (1250–1517) subsequently brought the *īwān*-and-dome mosque to preëminence, though with considerable alterations. The inner courtyard became appreciably smaller; the great façades of the gateway and the *īwān* vanished, being incorporated in a closed block with simple façades of which the features were on a large scale, and this block contained the *madrasa* and other subsidiary spaces. The coloured brickwork was replaced by alternate courses of white and red freestone; the ogee arches by pointed and lobar arches, frequently narrowed at the base, and often composed of artfully indented red and white keystones; and the foliate-patterned faïence tiles by geometrical twined ornament in stucco and stone. Most of the monuments of this style are to be seen in Cairo (*e.g.*, the "Tombs of the Caliphs," the mosques of Sultan Hassan [1362], Quait Bey, etc.), others at Aleppo, Damascus and elsewhere.

Ottoman Style.—In Asia Minor, under the Seljuq and early Ottoman rulers, the inner courtyard was transformed into a central domed hall, and the *īwāns* into lateral aisles, as in most of the mosques of Konia, Isnik and Brussa. After the capture of Constantinople (1453), this development, originally due entirely to the severity of the climate, was combined with Byzantine traditions, and gave birth, mainly through the agency of the architectural genius Sinān, to those immense domed mosques—such as the Mahmadīya (1463–71), the Sulaimānīya (1550–56), and others at Stamboul, the Salīmīya (1512–20) at Adrianople, etc., which continued the plan of St. Sophia's (*see* ARCHITECTURE; *Byzantine and Romanesque Architecture*). A hollow dome resting on four gigantic binding-vaults was enlarged by half-domes round its circumference, and these again by smaller half-domes intersecting them, thus reaching the greatest height and volume obtainable by a single hollow vault, and surpassing in loftiness even the dome of St. Peter's at Rome. However vast their proportions, these buildings presented an appearance of squatness, which had to be counterbalanced by slender, pencil-like minarets. The architectural forms are related to the Mameluke style in their detail, but faïence tiles also were used for the decoration of the smaller surfaces; and in the 18th century the influence of the European rococo style made itself felt.

Indian Mohammedan Style.—In India (*see* INDIAN ARCHITECTURE) also the Persian *īwān*-and-dome mosque was the predominant type. But since the conquerors, being but few, were obliged to employ Indian masons, the Persian true vault was driven out by the Indian corbelled vault. In the earlier period the Persian ogee arches formed a mere façade in front of a mosque of the Arabian type, with Hindu pillars, purged of their heathenish figural plastic decoration, and *maqsūra* domes; the best are the mosques at Gujarat. In Delhi, apart from a few sultans' tombs like those of Īltutmysh and Mohammed Tūghlaq, only parts of the Great Mosque, such as the Alāī Darwāza (13th century) and the great minaret, the Qutb Minār, have been preserved; the walls, often inclined, are noteworthy. After the buildings in the Hindu manner erected by the Emperor Akbar (1556–1605) at Fathpur-Sikrī, Agra and Sikandra, the Persian influence becomes stronger under the later Mogul emperors Jahāngīr and Shāhjahān in the 17th century. The Friday mosques with pillar-halls and very squat *īwāns* as gatehouses, the mausoleums like the tomb of Humāyūn at Delhi and the marvelous Tāj Mahal at Agra, are perfectly proportioned creations of the same type as the Persian vaulted sepulchres. The most usual material is white marble with coloured tarsia work, but red sandstone is also found. The principal architectural forms are the ogee arch, the lobar arch, and the Indian lotus dome; *chattrīs*—small domes with projecting roofs, carried on pillars—are widely used as ornament.

Secular Architecture.—The tendencies in the development of the mosque appear in every detail in secular architecture. Of the palaces of the caliphs at Damascus, Baghdad and Cairo, as of many others built in later times, we know only from descriptions. We are, however, acquainted with several of the country houses (*bādiya*) of the 'Omayyads in the desert to the east of the Dead sea, including Qusair 'Amra with its vaulted baths adorned with frescoes in the later antique style. Another old Persian type (*hīra*) is to be found at Mshattā, in the same region, and in Ukhaidir and the 'Abbāsid residence at Sāmarrā in Mesopotamia. They are rectangular castles, from whose entrance one proceeds through a number of anterooms to the hall of audience. Next come the prince's apartments and the harem; behind is a garden, and perhaps soldiers' quarters on both sides. With the downfall of the 'Abbāsids, cities gradually assumed a type which, with its castles and its narrow, irregular streets, resembled mediaeval European towns. Fine examples of such fortresses in a style closely akin to the European are to be seen in the castles of Aleppo and Baalbek. The Alhambra, in Spain, is another such; the rooms of the castle are grouped in an irregular but very intimate style around courts and gardens, but—as in the Alcázar at Seville and in Moroccan palaces—are clearly divided into reception-rooms, harem and *mashuar* (offices); the decoration is extraordinarily rich and luxurious. Subsequently the plan of dividing the palace up into a system of courts and pavilions surrounded by gardens, as in the Safawid castles at Isfaham and the Old Sarai at Stam-

EXAMPLES OF MOHAMMEDAN ARCHITECTURE

1. Dome of Rock (Mosque of Omar), Jerusalem, erected over the rock at Jerusalem from which the angel Gabriel was said to have carried the prophet through the heavens in a dream. It is an octagonal domed building in the Byzantine style; built by Abdalmalik, A.D. 691, with later additions
2. Hall of Justice in the Alhambra, Granada, Spain. This hall is at the eastern end of the royal palace built chiefly between 1248–1354 in the reign of Al Ahmar and his successors. Richly modelled geometric plaster decorations, brilliantly painted and gilded, are carried out in the series of courts, halls and apartments
3. Cairo. In the upper right (with dome and two slender minarets of the mosque of Muhammed Ali), is the Citadel, built by Saladin in 1166. The domed buildings in the foreground are the tomb mosques known as the Tombs of the Mamelukes (*c.* 15th century)

bul, was introduced from Persia; the living-rooms, small and adorned with frescoes (often erotic) and tiling, were grouped around one or more central *īwāns*. In India, at Delhi, Agra, Lahore and Gwalior, separate pavilions were built on the castle walls, with a view over the valley and the cool river on one side, and over arcaded gardens on the other. From these private apartments access was gained through a small door to an open hall with a gallery, on which the ruler gave public audience; this hall (*dīwān-i ʻamm*), which was set apart for the grandees, was surrounded by a courtyard where minor reviews were held, and to which the common folk were admitted. It was reached from the gate on the town side by a passage flanked by offices and shops, leading to an outer court with soldiers' quarters and a gateway with a bandstand (*naggara khāna*).

Caravanserais—fortified hostelries for travellers—are generally built on the plan of the *īwān* mosque, the cells serving as stables and guest-rooms; bazaars are covered streets with shops, having pillars with round-arched vaulting in the West, and long rows of ogee-arched vaults in the East. Most of the bridges disappeared long since, but Isfahan and Julfa are joined by two very beautiful examples dating from the 17th century, with a two-storied superstructure and pavilions.

Few hospitals have survived, though at one time there must have been a great number. The magnificent Mūristān of Sultan Qalawūn at Cairo (1285) is essentially a monument of the Mameluke *madrasa*-style. Pump-rooms (*sabīl*) were often philanthropic foundations; in Egypt they usually included an elementary school on the upper floor, beneath which was the latticed pump-room proper, and in front of it a basin. The Ottomans, however, particularly in the 18th century, transformed them into delightful pavilions with immense overhanging roofs and a basin on each of the four sides.

Private houses are of extraordinarily varied types, but in all cases the living-rooms and reception-rooms are separate from the women's apartments. In the Mediterranean region the latter are generally on the upper storey, with windows closed with *musharrabiya,* but in the East they are in a second court. Here also, ever since the best period of Sāmarrā, the walls are broken by stucco niches to hold lamps, glasses, bottles, books, etc., while the West prefers painted wooden wainscoting with built-in cupboards. Furniture is almost wholly lacking. The methods of securing protection from the heat are interesting: in the West, where water is more plentiful, there are half-darkened inner halls containing springs; in dry Mesopotamia and Persia there are subterranean summer apartments with air-shafts like conning-towers; in India, quarters are transferred to lofty terraces exposed to the wind and surrounded by small ponds. For architectural ornament *see* Mohammedan Art. *See* also, Periods of Art.

MOHAMMEDAN ART. At the death of the prophet Mohammed in 632, his conquering Bedouin hosts already stood on the frontiers of the highly civilized empires of Byzantium and Persia. During the previous four centuries these empires had passed through great vicissitudes, and of the tradition of ancient Hellas but feeble remnants survived. In Byzantium Christianity, an importation from the East, prevailed; court, civil service and army, however, were intermixed with descendants of the barbarian tribes which had come during the migration of the Nations, and in the Semitic provinces the Monophysite spirit rose up against the "idolatry" of the Greeks. In Persia, on the other hand, there ruled the Sassanids, whose power rested upon their hosts of cavalry from the interior of Persia, and who cultivated, side by side with the Zoroastrian religion of their fathers, ancient oriental traditions only faintly touched by Hellenistic influences. When, on the death of the fourth elected caliph ʻOsman in 661, the early communism of Islām came to an end, the whole of Tripoli, Egypt, Syria, Mesopotamia, Armenia, Georgia and Persia were already under the sway of Islām, which was soon extended to the rest of North Africa and Spain, Turkestan and the lower Indus valley. Until the middle of the 10th century all these lands were ruled by the Arabs; but even under the first dynasty of the Umayyads (661–750) the Christian Syrians and Copts began to gain a considerable influence in intellectual life, followed by the Persians under the ʻAbbāsid dynasty (750–945), and the Ostrogoths under the Umayyad caliphs of Spain (independent after 755); for the Arabs themselves owned few traditions of culture equal to the needs of a universal empire. With the decay of their empire, the ʻAbbāsid caliphs were forced to maintain their power with the help of mercenaries from the nomadic Turkish tribes of the north, but from the middle of the 9th century onwards these Turkish mercenaries began to create "lieutenancies" enjoying an even greater degree of independence, with the result that after 945 the caliphs found themselves reduced to a position resembling that of the popes. In the middle of the 11th century western Asia was overrun by new hordes of Turkish nomads, who founded the Seljuk empire, which, however, soon disintegrated into a number of small states. In the first quarter of the 13th century the Mongols and their kindred peoples of horsemen from Central Asia pushed as far as Syria, Asia Minor and Hungary. Other Turkish tribes followed, notably the hosts of the great conqueror Tīmūr (Tamerlane, *c.* 1400) in Turkistan. In 1300 the Ottomans founded the Ottoman Empire, and in 1502 the Kizilbash, of the Persian Shiʻa sect, founded the Persian empire under rulers of the Safawid house; these two empires remained unaltered till a few decades ago. In 1526, in India, which had previously lain under the domination of a series of Afghan and Turkish dynasties, descendants of Tamerlane founded the Mogul empire, which was ultimately destroyed by England in 1803. In Africa, on the other hand, the leadership soon fell to the nomadic Berber tribes, which formed, in addition to a number of small states, the orthodox kingdom of the Almorawids (1087–1147) and that of the Almohads (1147–1230) in the far West, and, after the loss of Spain in 1492, the kingdoms of the Marīnids, Saʻdites and Sherīfs of Sijilmāsa. Egypt was ruled from 969 to 1171 by the Shiʻite anticaliphs of the Fatīmid dynasty—Berbers likewise—and before and after that period by mercenaries (mostly of Turkish race), including the Ayyubids (1169–1250), who were Kurds, and the Mamelukes (1250–1517), who were overthrown by the Ottoman Sultan Selim I.

Origins and Nature of Mohammedan Art.—In a world enclosed between desert and steppe and ruled by nomadic races, Mohammedan art inevitably followed an entirely different path from that of the West. Western classical art developed among settled tillers of the soil and in towns, and consequently it is intellectual; it loves the clear structural consistency of architecture, and carries it on into architectural ornament; it prefers the more or less naturalistic sculpture and relief, the portrayed figure, and reproduces them in industrial art. The art of the nomads, on the other hand, proceeds from the tent and the loom, and for that reason the tectonics of Mohammedan architecture are also limited to the primary forms, though it frequently resolves them into delightful shapes, and adorns all the wall-surfaces with purely geometrical decoration resembling rugs over the framework of a Kirghiz tent. Their decorative art is based on pure ornament, script, arabesque and intertwined bands. As in early Irish, Scandinavian and also Romanesque art, representations of human beings and animals are combined with fillet and arabesque ornament, and in plastic art they appear only in low relief. Only in painting do they acquire an independent life under antique Sassanian and eastern Asiatic influences, but even so they are partly in the nature of calligraphy, against the background of an equally conventional, tapestry-like landscape. Except in the most recent

period, naturalism never existed. Added to this, the Arabian world had a dislike of figural art—already perceptible in eastern Christianity—which absolutely prohibited figural representations in the early period of Islām and under the Berber dynasties of Africa and the Mamelukes of Egypt and Syria, though under the 'Omayyads and 'Abbāsids and most of the Shi'ite and Turkish dynasties it was only excluded from public buildings.

Plastic Art.—Plastic art on the larger scale therefore seldom fell under outside influences. Thus the Seljuks brought with them from eastern Turkestan a plastic tradition akin to the Buddhist art of central Asia; this tradition is represented by the few extant statues and reliefs of lions, double eagles, dragons, angels, etc., from the city walls of Konia and Baghdad, and by a few stucco plaques depicting scenes of court life. Apart from these, we find human and animal figures in low relief scattered here and there through the decorative carving on rafters and beams of the entire period from the 11th to the 14th century. Under the Mogul emperors in the 16th and 17th centuries Indian influence appears in the elephant-statues of Fatehpur-Sikrī and Delhi, and Sassanian influence in the 19th century in the rock reliefs of Fath 'Alī Shâh of Persia. Other plastic art, however, is entirely restricted to small-scale works, chiefly figures of lions, elephants and birds in glazed stoneware or bronze, strongly conventionalized as the nature of the material required, and used as water-vessels or smoking appliances; a madonna with Mongolian dress and appearance, made of faïence, is an exception.

Painting.—Figure-painting is much more important. It is true that it was excluded from public, political and religious edifices. In the private apartments, however—bathroom and harems especially—painting was tolerated by the clergy, and found its expression in frescoes, illustrated erotic and edifying books, and household vessels, goblets, bottles, etc., adorned with figures. Even the caliphs decorated the private apartments in their palaces in this way. Thus between 712 and 715 the Umayyad al-Walīd had the bathrooms in his desert castle of Qusair 'Amra painted throughout with frescoes in the later antique style, depicting birth and death, the three ages of life, hunters and hunting animals, musicians and dancing-girls, women bathing, the caliph on the throne, the emperors overthrown by Islām, and so on. This latter group betrays the influence of Sassanian art, which dominates the harem frescoes reconstructed out of scanty remnants in the 'Abbāsid residence at Sāmarrā (836–876). Here we find dancing-girls in every possible pose, naked and in flowing robes, with diadems and long braided hair, with floating veils, bowls and wine-jars; huntresses and horse-women, priests and warriors, and animals of every kind, in a heraldic style on medallions composed of intertwining tendrils and bands in endless repetition, symmetrical and hieratic. In the Alhambra at Granada (13th–14th cent.) we meet with the last Moors of Spain represented as noble knights and troubadours in roof-paintings of an almost Gothic style; and in the frescoes and faïence tiling of the castles of Isfahan and Ashraf, displaying exquisite calligraphy, and betraying strong Eastern Asiatic influence, we see the amorous and oenophilous sentiment of the courtly youth of the Safawid era. In India, the Mogul rulers of the 16th and 17th centuries had their harem apartments painted throughout with frescoes, though these were discarded about 1700 by the orthodox emperor Aurangzēb; but wall-paintings, some with Buddhist subjects, have been preserved in the bedroom of Akbar's soon-abandoned residence at Fatehpur-Sikrī, and we know from a few contemporary miniatures the semi-European paintings that Jahāngīr caused to be executed at Agra. (*See* also PAINTING.)

Ornament.—Ornament is the centre of Mohammedan art. It has supplanted all the other possibilities offered by different individual technics. Utilizing them all, dependent on none, it is a self-contained world of form, which embraces indifferently the walls of mosques and castles, the backgrounds of figure-paintings, the details of sculpture, glasses, pots and vases, furniture and bronze implements, arms and jewellery, bookbindings and calligraphy, a vast storehouse of forms, turning every technique, every material to its own uses in the most perfect taste. The motifs from which this ornament grew came from the later antique, the ancient East, and the barbarian migrations. In the earliest monuments, particularly the great frieze in relief at Mshattā, the prevailing feature, as in Byzantine and Romanesque art, is the spiral tendril springing from the vine, its spaces filled in with vine-leaves and branches of grapes, and diversified with all kinds of animals and large rosettes. In the frescoes and in the "third style" of the stucco wall-facings in the 'Abbāsid residence at Sāmarra we find the same motif, though already again greatly conventionalized. Beside it, however, we encounter a new type of ornament undoubtedly traceable to the wood-carving of the nomad tribes of the north, consisting of very denatured palm-leaves, whose contours soon became an independent style, a complex of free curves. Under the Turks and the Arab dynasties that took their artistic notions from them (10th to 16th century), this developed into a purely abstract art of decoration, carried to the furthest possible extent; its leading motifs are the fillet, the arabesque and the palm-leaf. The first is the most important and is derived from the northern nomadic art. Plain or twisted, with herring-bone or circular patterns, it divides every area into border and central field, angle and centre medallions, friezes, etc. It curves into circles and wavy lines, imitates the shapes of architectural vaults, piles up tendril-wise in vaulted arcades and forms complicated trellis patterns. This developed into the twined pattern of stars and rosettes favoured during the Mameluke period, which presents designs which, immensely numerous though they are, are always mathematically accurate. The intervening spaces are filled with polygons of every shape, stars, garlands, rosettes, often plain or in simple patterns that secure their whole effect through colour-contrast, and frequently decorated with rich arabesques diversified with palm-leaf motifs. The early twining vine-leaf, the palm-leaf, the "tree of life" of the ancient east, are combined in an inextricable dramatic unity, enriched since the Mongol period with completed palm-leaves and even with distortions of these into diabolical masks, houses, etc., and Chinese cloud-strata and shreds. Thus western Asia, especially Persia, was dominated by the arabesque, in delicate spirals, often of the shape of snail-shells, with little rolled-up and not uncommonly pinnate leaves, and rosettes, and palm-leaves radiating outwards. It served also as a background for decorative figures of phoenixes and Chinese dragons, hunting animals and birds, musicians and dancing-girls, but most of all for ornamental inscriptions. The clumsy early Arabic script, the "Kufic," with its numerous vertical and oblique strokes, produced an extraordinarily monumental effect, and for that reason, it continued to be employed as a decorative writing, and developed into a new form, used with special frequency in Persia—the "floral" Kufic, in which the top of the characters blossom into floral tendrils. This was also combined with the trellis ornament, a notable example being the stucco-work in the Alhambra at Granada. The later cursive *naskhī*, with its wealth of curves and twists, also proved a highly decorative script, the final letters of words being generally crossed with the long strokes of the initial letters like an ornament. They were also frequently used to provide a delicate background to the heavier characters of the Kufic. The *shikasta*, and the animal figures which were artfully formed from the characters of some sentences (generally from the first *sūra* of the Koran) were confined, however, to the Persian book-designer's art. After the 16th century Mohammedan ornament began to decay. As early as the 13th century niches framed by arches and pillars, vases with bouquets of flowers, hanging lamps, cypresses, etc., had appeared sporadically; these now came into favour as decorative motifs, and their semi-naturalism drove out the wealth of abstract ornament.

Architectural Ornament.—Since tectonic arrangement in architecture was confined to the broad lines, a wide field was presented for ornament. In the 'Omayyad period preference was given to the glittering glass mosaic and deep-shadowed pierced stone filigree-work, both common in Byzantium. With the victory of the sun-dried brick under the 'Abbāsids, these were superseded by stucco facing sometimes moulded in the flat, sometimes likewise cut in high relief, as in the third style of Sāmarrā and in wonderful inscriptions in floral Cufic from Persia, all originally richly painted. Later, in the Turkish and Mongolian periods, stucco gave

1. Top of a carved stone sarcophagus, from the tomb of Bairam Quli Khan at Faizabad, near Bukhara, Turkistan. Dated 942 (A.D. 1534). 2. Persian or Syrian inlaid candlestick with handles, 14th cent. Hamburg Museum für Völkerkunde. 3. Horn or "oliphant" (ivory), carved with interlaced ornament; probably Mesopotamian, 10th–12th cent. The metal mounts are of later date. 4. Bowl with *graffito* designs, "Amol" pottery, 10th–12th cent. 5. Pottery dish, Persian, 17th cent. 6. Bottle, siliceous glazed earthenware, Turkish, 16th cent. 7. Stone and glass window, in black and white. 8. Albarello, Syria, 14th cent.; thick faience. Ht. 25.5 cm. 9. Bronze duck, perhaps an incense burner, Persia or Turkistan, 7th–8th cent. Bobrinsky collection, St. Petersburg (1912). 10. Enamel glass mosque lamp. 11. Helmet, iron, Mongolian, middle of 16th cent. (Moscow)

way to the cheaper substitute for the more costly mosaic, in freestone or brick, but most often in faïence tiling. The less important parts of the rough core of the wall, often quite carelessly put together, were overlaid with a particoloured mosaic of glazed bricks of varied shapes, making all kinds of twined patterns and formalised Cufic words endlessly repeated; while the major portions were covered with mosaics of tiles cut skilfully to the exact shapes of the prevalent patterns, in harmonious colour-schemes, particularly blue, or in combinations of faïence ornament on a stucco ground (in relief) or friezes of inscriptions in incised stucco in the intervals of faïence mosaic. Admirable also are the script friezes of glazed tiles with dark blue characters on a ground of golden-brown arabesques. With the decay of ornament after the 16th century, this type of mosaic was generally supplanted by square faïence tiles with the decoration simply painted on them. Apart from one or two magnificent portions of buildings, Syria, Egypt and the West were content with coloured stucco-work and mosaics of particoloured stone plaques, generally white and red or white and black. (For plan and tectonics *see* MOHAMMEDAN ARCHITECTURE.)

Furniture.—Another reason for this rich wall-decoration lies in the almost complete absence of furniture, in our sense of the term, in Mohammedan places of worship and dwelling-houses. This, like the custom of sitting on the floor, was due to the nomadic habit. Household crockery was kept in stuccoed recesses in the walls, or on wooden shelves and in cupboards built into the walls; of the latter there is at Berlin a fine example from Aleppo, with biblical paintings in the Persian style. Furniture, in our sense, was represented in private houses by small, low, round or oblong tables, and in India also by beds (*chārpoy*). Persons of consequence used the *takht,* but sat on it in the same posture as on the floor; chairs came into use in the 17th century only in the highest circles. In the mosques the Koran was placed on a desk (*kursī*) like a campstool, and was often kept in a small circular cabinet; the pulpit (*minbar*) was a domed box at the top of a staircase, reached through a doorway that could be closed. A feature of most of these objects is the manner in which they are decorated with tasteful tarsia-work of small boards, richly carved and inlaid with mother-of-pearl, ivory, etc. This was necessary owing to the wood available and the danger of warping. The harem doors were worked in like fashion, often with rich bronze ornamentation, and the balcony-railings (*musharabīya*), made of small curved wooden pales. (*See* also INTERIOR DECORATION.)

The remaining objects in the house comprised rugs and cushions, jewel-cases and boxes, together with table utensils, lamps, smoking equipment, open charcoal-pans (as stoves) and warming-pans, candle-sticks, etc., in bronze, faïence, glass, ivory and other materials. (For rugs and woven fabrics, *see* TEXTILES.)

Ceramics.—The Mohammedan ceramic art built upon ancient oriental traditions, enriched them for its own religious purposes with a new and highly effective technique, and pursued its development under growing influences from eastern Asia. The use of the coloured glazed brick was inherited from Babylon, as was the unglazed earthenware in the barbotin style (in which the pattern is made by applying bands of clay) with the "tree of life" and "naked goddess" (Astarte) motifs, enriched with Hellenistic and Sassanian elements, laurel and acanthus leaves, stubs of palm-leaves, and later wreathed medallions centred with animal figures, griffins, eagles and the like. Examples are to be seen in the pottery of Sāmarrā, though this is almost entirely in tiny shards. Echoes of this barbotin technique appear in the ware of Mosul down to the 14th century, and in the Ghabrī ware of Persia, in the sgraffito manner, often with lively painting, until *c.* 1200. Contemporaneously, in Sāmarrā, we find the first lustre-ware. Islām in its early days was puritanical enough to proscribe gold—like silk—as a worldly luxury, and for that reason, in later times, faïence painted with a gold lustre changing to green, brown and violet was used as a substitute; in the earliest examples the forms of the magnificent golden and silver vessels of the Sassanian epoch can still be plainly traced. This style rose high in favour, particularly in the Seljuk and Mongol periods, but disappeared at the beginning of the 17th century. The 'Abbāsid caliphs also imported porcelain, from China (Sung dynasty), and caused its white, yellow and green overflow-glazing and its stippled, fish and other designs to be imitated in earthenware. With the Seljuks came a new wave of far eastern influence, the chief centre of the industry under their rule being Rhagae, the forerunner of Teheran. The "*mināi*" ware shows chiefly bowls, beakers, tankards and bottles in spirited painting and gilding on a white ground, often with rich figure-compositions arranged in bands. There are also vessels of similar types as well as such akin to the bronzes, in animal and human form; their design is left white, generally on a ground of violet lustre, and shows the classical arabesque and palm-leaf motifs, sphinxes and birds with crowned women's heads, peacocks, elephants, scenes of court life and war, and, above all, horsemen with their characteristic pigtails and their garments adorned with arabesques. After the destruction of Rhagae by the Mongols, Sultānābād and Veramin became the centres of the ceramic industry in the 13th and 14th centuries. Favourite types were not only *mināi* and lustre ware, but also faïence in green and dark blue tones, in many cases with moulded ornamentation, and tiles richly decorated in lustre. From the 16th century onwards, Chinese white porcelain with blue and grey designs was imported in large quantities and became a regular type; its decoration was copied and freely developed, but porcelain itself could not be successfully manufactured, and a kind of semi-faïence, closely resembling it, was made instead. Persian pottery forms the basis of that of Syria, Egypt, Spain and Asia Minor. In the area of the Arab civilisation, figure-motifs disappeared at an early period, and bands of script or arabesque, arranged radially or in rings, became the prevalent form. In Spain, under Christian rule, this art developed still further, and absorbed Gothic motifs; the 14th and 15th century wares of Malaga (whence the name "majolica") and of Paterna and Manises, two suburbs of Valencia, exercised a very strong influence on the majolica ware of the early Italian renaissance. On the other hand, in the Ottoman pottery of Kutahia and Isnik ("Damascus" and "Rhodos" ware), which flourished from the 15th century onwards, relatively naturalistic tulips, carnations, roses, lilies, cypresses, etc., and also figure subjects, were preferred for purposes of decoration, cobalt blue, turquoise, green and manganese violet being used as colours, generally on a white ground. (*See* also POTTERIES AND PORCELAINS.)

Glass and Crystal Ware.—Unlike pottery, glass-making was inherited from Hellenic antiquity, and was centred in Syria and Egypt. The Fatīmid period produced narrow-necked bottles, tankards and beakers, and scent-bottles ornamented with externally applied bosses, threads and bands, or with spiral tendrils and animal figures moulded into the glass. In addition, imitations were made ("Hedwig glasses") of rock-crystal vessels with ornament consisting of figures and circular tendrils, of Sassanian origin; many of these came early into the possession of religious or noble houses in Europe, and have thus been preserved. The most marvellous work, however, was produced at Aleppo in Syria, under the Ayyubid and Mameluke dominations. Bottles, beakers, goblets and above all hanging lamps for mosques, were covered with bands of arabesque and script and with medallions in enamel colours (white, red, blue and yellow) and gold; the subjects included figures of horsemen and others, and the coats of arms of the court offices. The celebrated "Luck of Edenhall" was a goblet of this type. Modern Persian glass originated in the industry promoted by Shāh 'Abbās the Great (*c.* 1600). (*See* GLASS.)

Metal-work.—Here again oriental traditions, particularly those of the Sassanian empire and the Far East, predominate. Most of the work is in bronze, iron being still used almost only for weapons. The use of gold and silver also was limited, because it was forbidden by the Koran; and although the prohibition was often ignored, the great value of such objects led to their early destruction and melting down. Mohammedan jewellery of the early period is therefore of extreme rarity, being represented only by a few buckles, bracelets, etc., of the Fatīmid and Mongol periods, and such pieces as the Gerona silver chest (akin to the similar ivory coffers) in Spain and the Berlin silver tankard of the 13th century, with its embossed reliefs of Sassanian animal friezes.

Bronzes.—Such animals in the Sassanian style, lions, dragons, sphinxes, peacocks, doves, cocks and the like, were also cast in bronze in three dimensions, and served, like their ceramic counterparts, as basins, braziers, etc. They were particularly sought after in the later 'Abbāsid, Fatīmid and Seljuk periods, and from Egypt they became the prototypes of similar European forms. It was the Seljuks, apparently, who introduced the round bronze mirror, the reverse of which shows in low relief either two sphinxes face to face—in the manner of the *mināi* pottery—surrounded by a twined pattern, or two friezes with the astrological symbols of the seven chief heavenly bodies (sun, moon and the five nearest planets) and the twelve signs of the zodiac, surrounded by a band of script; this goes back ultimately to Chinese origins. In the earlier period, mugs, etc., were ornamented with animals in low relief, but this was quickly supplanted by engraving. Under the later Seljuks (particularly the Ortoqid Atabegs of Mosul) and the Mamelukes, engraving became almost the only form of decoration, but only to serve as a basis for the yet richer technique of inlaying: small silver plates and wires, themselves delicately engraved, were hammered into the ribs and surfaces, which were hollowed out and undercut at the edges. In place of this an Ortoqid bowl in the provincial museum at Innsbruck has the spaces filled in with cellular enamel. This was a method of evading the prohibition of precious metals, just as gold lustre was in pottery. The ornament consisted of friezes and medallions in lattice and arabesque work, the interstices being filled with figures of warriors, hunters, musicians, animals and astrological symbols. These were superseded later by Mameluke coats of arms and inscriptions. In the 15th century the technique was imported from Syria to Venice, where productions of the same kind, *alla damaschina* or *all' azzimina* were made right into the 16th century by Mohammedan masters, and were in great demand. In the East the process is still common, but both technically and artistically it has decayed. In the 15th century, however, there was a renascence of pure metal-engraving, but the design—inscriptions and arabesques in the Tīmūrid and Safawid styles—was not cut into the material, but left free in the manner of a relief, the background being etched in black. Decoration was applied to bowls and basins, mugs and vases, mortars, braziers and warming-pans, candlesticks and smoking-utensils, inkstands and jewel-cases, Koran-holders, mosque-lamps, and *kursīs*. These are generally in the simplest possible forms—spherical, cylindrical, prismatic—and are developed by cutting off corners, adding projections, narrowing and channelling the walls, and by reduplication; the subjects include motifs of vegetation and animal life—the former mainly in the necks and feet of vessels, the latter for handles and ears, feet and sometimes small spouts. (*See* Bronze.)

Weapons.—Ancient Mohammedan weapons of any artistic value are comparatively rare: most of the extant pieces date from the 17th or 18th or even early 19th century, while the period from the 14th to the 16th is represented by a fair number of fine examples. Mohammedan swords were famous even in antiquity for their wonderful blades of "Damascene" and "Toledo" steel. This high standard was attained by a laborious process of repeatedly welding together pieces of iron of different qualities, but its ultimate explanation lies in the peculiar process used for smelting the Indian raw material—a method whose results have been surpassed only by those of the modern Bessemer process. The earlier blades are all straight; curved sabres and daggers do not become common until after 1500. The blades were ornamented with inlaid work of gold and silver threads, arabesques, blessings and—on the celebrated "Mongol blades"—also phoenixes and dragons in the Chinese manner; at a later period the inlay was confined to the part near the hilt, the remainder being adorned with engraved reliefs. For the handle and guards, gold and cellular enamel were used, as on the magnificent "Boabdil" swords named after the last Moorish king in Spain (15th century), with their hooked guards, and many Ottoman and Persian daggers and sabres of the 17th and 18th centuries; nephrite, ivory and silver plating with jewelled ornament were also used, especially for daggers. The scabbards had ornaments to match the hilts, and were covered with nielloed silver plating, leather, snake-skin or ray-skin. Battleaxes and maces are also found, though these were often mere symbols of command and high position. The former display not only inlay, but also in many cases engraved relief and even filigree work. The heads of the maces were often made of rock crystal, but more frequently were cast solid, in a smooth pear-shape, with grooves or bosses, richly inlaid. Shields were round with a boss in the centre: in Egypt under the Mamelukes they were of inlaid iron, elsewhere generally of leather, with painted lacquer surface.

The armour, of Sassanian origin, consisted of a mail shirt, arm-pieces and greaves, a round breastplate, and a pointed helmet consisting of several spangles riveted together. Not until a late period did a coat of four plates (*chār-āina*), and even a cuirass in the Spanish manner, become common. From the 15th century onwards the helmet was made in one piece, though there were in addition a number of movable parts such as nosepieces, cheek-pieces, neckpieces, etc. The decoration, however—grooves or medallions between radiating ribs on a broad frontlet—betrays the original construction. The earlier pieces (15th century) were broad and protuberant, and came so low down over the forehead that eye-notches were necessary, the reason for this shape being that the turban was worn under the helmet; the later examples fitted closely, and were pointed or hemispherical with spikes attached, nosepieces and crests. The usual ornamentation in the early helmets, most of which are ascribed to western Turkistan, consists of silver-wire inlay; later, in Persia, it is generally iron engraving, sometimes combined with inlaid work; and in the grooved Ottoman storm helmets, black etching. An offshoot of the last-named is the "Zischägge," often richly worked, which was used in the 17th century in Hungary, Poland, and even Germany.

Bookbinding and Lacquering.—Koran manuscripts, and also rich miniature books were all bound in leather, the edges being protected by a flap. A very old binding from Egypt shows inlaid work, but apart from this the usual decoration up to the 15th century consists of stamping with beaded edges, medallions in the centre, and in the corners triangular ornaments of unobtrusive script, plait and palm-leaf patterns. From the 16th century onwards, however, this decoration is transferred to the inner side of the cover, in finely-detailed filigree-work against a brightly-coloured background. On the outside it is replaced by opulent stamped gilding which has indeed a similar composition but is formed of arabesques and bands of clouds, and even of decorative figure-groups; sometimes also the outside is covered in the Chinese manner with lacquer-work, which in the early period shows occasional dragons and phoenixes, and later flowers and romantic and genre scenes. From the end of the 18th century this technique was in high favour, and was applied not only to bookbindings, but also to writing-cases, jewel-cases, toilet accessories, and even shields and bows. (*See* also Bookbinding; Lacquering.)

Development and Influence Elsewhere.—When the great civilizations of Egypt and Babylon ceased to exist, the culture of Hellas had conquered the Orient with Alexander's victorious progress. Islām was only one factor in the recovery of the East brought about by the Aramaic, Coptic, Persian and Arab stocks, parallel to which proceeded the migration of the nomads of central Asia and eastern Europe and the Germanic nations whom they pushed before them. This migration took its rise from the frontiers of China, and in the later thrusts of the Turks and Mongols it also overran the area of the Arabian civilisation; and beside and behind it came the peaceful influence of the Far East. Thus in its early period Mohammedan art continues the assimilation of Hellenistic and ancient Oriental motifs begun by the later Persians, and from the 'Abbāsid era it falls almost wholly under the tradition of the Sassanian empire. With the rise of the Turkish dynasties the nomad character becomes increasingly marked, and from the Seljuk period onwards the influence of Eastern Asia grows in strength, particularly from the Mongol to the Safawid period. Meanwhile Islām fused all these influences into a completely individual abstract style, which reached its zenith, artistically and technically, between the 10th and 16th centuries. Thereafter decadence begins, veiled in the 17th century by extravagance of external splendour, but betrayed by a tendency towards some degree of naturalism and an increase of European

influence, and leading to complete decay by the middle of the 19th century. During its greatest period, however, the influence of the Mohammedan culture extended through India as far as Java, to China, to the Sudan, and to the whole of Russia. The European culture of the middle ages and the Renaissance was very largely derived from it. Mohammedan brocades and carpets, ivories (coffers and "olifant" horns), glasses and aguamanils, etc., found their way from Spain, Sicily and Fatīmid Egypt into the ecclesiastical and princely treasure-houses of Europe; in the period from the Crusades to the conquest of Granada the borrowings consisted mainly of Mameluke weapons and glass, azziminia bronzes, Toledo blades and majolica-ware from Spain, albarellos, etc., and book-bindings. In the east the Tatars brought their culture and art, especially weapons and clothes, to the Russians. Further, through the Turkish wars various Mohammedan utensils and objets d'art—stuffs, costumes, rugs ("Polish rugs"), sabres, helmets, etc.—became naturalised in Hungary and Poland, and even in Austria, Saxony, Bavaria and Prussia.

MOHAMMEDAN CAMPAIGNS. Among the military cataclysms which have changed the course of world-history on the largest scale, none is so little known to us in detail as the outburst of the first Mohammedan invaders from their Arabian deserts. That they smashed in a few years the old Sassanian kingdom of Persia, tore Syria, Egypt and Africa from the East-Roman Empire, and even after their first wild rush was over, pushed their conquests as far as India on one flank and Spain on the other, is certain. But the details are wrapped in obscurity, and the very dates of important battles and sieges are doubtful. This comes from the fact that we have no solid contemporary history written by the witnesses of the cataclysm. From the side of the conquerors there is nothing earlier than the chronicle of Al-Wakidi, written a full century after the Arab conquest of Syria and Persia, when the early campaigns of the Muslim had become a heroic legend, and were decorated with exploits and marvels which make them not much more utilizable as solid history than the *Chanson de Roland* or the Romance of Fulk Fitzwarren. The Persian kingdom left memories of Sapor and Chosroes, mixed up with those of earlier and more fabulous kings, in much later epics—but no serious account of its own downfall. At Constantinople the later 7th century and the earlier 8th century show the biggest blanks in chronicle-writing in the whole history of the East Roman realm. We have to depend for our knowledge of the Saracen invasion, as seen by the Christian witnesses, on Theophanes and Nicephorus, both of whom wrote at the beginning of the 9th century, some 130 years or more after the loss of Syria and Egypt. They had no great desire to linger over the details of ancient disasters, nor had they any military interests. All that we get from them is curt mentions of battles and sieges, which are not always easy to identify with the military operations described by the romantic Al-Wakidi.

Matters become quite different as regards information when we have passed the year 800: the series of contemporary Arab Chronicles begins and military details of value can be extracted from them of the organization of the armies of the 9th century Caliphs. Still more useful are the elaborate descriptions of Arab warfare in the *Tactica* of the Emperor Leo the Wise (886–912), the notes on the Byzantine Empire of his son Constantine Porphyrogenitus (912–959) and the Manual on Military operation of Nicephorus Phocas (963–969), all of which deal at length with the ways of the chief enemies of the empire.

THE FIRST RUSH

Unfortunately the main military problem of the epoch is not how the armies of the Caliphs fought indecisively with those of the Emperors from A.D. 800 to 1000, but how the first rush of Mohammed's earliest followers, a century and a half earlier, broke down the Roman Eastern frontier, which had stood successfully for 600 years against enemies much more formidable, the Parthian and the Persian monarchies. On this neither the jejune annals of Theophanes and Nicephorus, nor the miraculous tales of Al-Wakidi and Al-Beladhuri give us any real assistance. We can only be certain that the destruction was not wrought either by heroic single combats, such as those which the Arab annalists describe, nor by the miracles of sand-storm and tempest with which they sometimes diversify their narratives. As far as we can reconstruct any outline of the campaigns of 632–641, the situation would seem to have been as follows. The old Roman military line of defence against the East had never been properly restored since the disasters of the reign of Phocas; and the garrison-armies of Syria and Mesopotamia had never been reconstituted on their old scale. When Heraclius imposed peace on the vanquished Persians in 629, he got back the Eastern provinces in a state of complete dilapidation—they had been in the hands of the enemy for more than ten years. The empire was bankrupt, and the army with which the last victories over the Persians had been won was an extemporized and heterogeneous levy, largely composed of barbarian auxiliaries. A great part of it must have been disbanded at the peace, for financial reasons. The recovered provinces had not settled down again to the habit of obedience; their population had been serving an alien master for many years, they had never been strong in "Roman" sentiment, and they were torn by virulent religious quarrels between the "orthodox" and the many sectarians. That active or passive dislike for the restored imperial government was rife is shown by the tame submission of many sections to the next invader, and by the not infrequent cases of actual treachery. The first Roman fortress which the Arabs attacked—Bostra—was surrendered by an apostate governor.

When the Muslim—bands of light horse with their modest *impedimenta* carried on camels—came up against Transjordania, they were attacking from the rear a province which had always in earlier days been attacked from the front in serious war. Previous Arab raids had been mere Bedouin *razzias*: Syria's earlier dangers had been from Parthian and Persian attacks from the north-east, on the front along the Euphrates.

Clearly then this new attack was delivered against a disorganized group of provinces, with an apathetic or even disloyal population, and under-garrisoned by an army which had recently been destroyed and reconstructed. The immense forces which the Arab romancers describe as arrayed against them never existed, and the Syrians and Egyptians made no more attempt to defend themselves against the Muslim than they had against the fire-worshipping Persian twenty years back. The resistance was entirely that of the Roman army, assisted by the strong walls of many towns which had been fortified in earlier and more prosperous ages. The army, such as it was, was weak in numbers; its main strength lay in the heavy cavalry which had replaced the ancient legions during the last two centuries; infantry had sunk into decay many generations back.

The Arabs had not been a formidable foe in earlier centuries, because of their inveterate tribal and family feuds, which made combination impossible. It required the genius of Mohammed to unite old enemies, and bind them together by a fanatical fighting creed. Even after his death, when early victories ought to have bound them together, there was grave danger of disruption, which was only prevented by the tact and moderation of his successors the caliphs Abu-Bekr and Omar. With a little less self-denial on the part of their leaders, the Arabs might have relapsed into their habitual petty quarrels, and the creed of the prophet might have made no figure in history. But spirited exaltation prevailed over ancient jealousies—invasions of Syria and Persia began, and suc-

cess was, from the first, so brilliant, that their feuds were for the moment silenced, and a strong conviction of their own invincibility came upon the Muslims.

CONQUEST OF SYRIA

Details are wanting—we only know that in all the earlier battles the Romans had the worst of the game. That the conquest of Syria nevertheless took seven years (632–638) was only due to the fact that the Arabs, formidable in the charge, had no skill in siegecraft. Hence the long sieges of Damascus and Antioch, and the possibility of isolated strongholds like the sea-girt Aradus holding out long after the bulk of the country had been overrun. In truth the invaders were not very numerous—if the regular Roman troops were also very limited in strength. And it was only gradually that the Arabs recruited their ranks with new hordes from the more recently converted corners of their own peninsula, and presently with renegades of all sorts, adventurers to whom plunder was all attractive, or disloyalists who thought Monotheism less repulsive than the theological formulae of their local enemies of the governmental faction.

It was the special luck of the Arab invaders that of the two realms which they invaded, Persia was ruled by a boy of 14 newly elected as a compromise at the end of the bitter civil war, while in the Roman empire was reigning a worn-out veteran. Heraclius had been a brilliant leader in the old Persian campaigns, but he was now over sixty, and already smitten with the dropsy which ultimately proved fatal to him. He was in Syria for one year of the War only, and then retired to Constantinople, taking with him the "True Cross," which he had brought back to Jerusalem in triumph only five summers before. In the last period of his illness he appears to have been suffering intermittently from mental affliction. His brother Theodore and his son Constantine failed to replace him in a satisfactory fashion, and in five years more all Syria fell into the hands of the Muslims (633–638). Egypt, where the population was still more hostile and discontented, and where many of the officials behaved with absolute treachery, was lost in two more years (639–41). Only the great harbour at Alexandria was defended with any resolution. After Heraclius' death an expedition from Constantinople recovered it for a moment, but lost it within the year (646), and no Christian army was to be seen again in Egypt till the age of the Crusades.

In the first years of the Arab conquest of Roman and Persian territory, the military system adopted appears to have been that of establishing great garrison-centres in a limited number of places selected for their strategical importance—Basrah and afterwards the more famous Kufa were the original bases on the Persian side, Damascus that on the Syrian; Fostat (Old Cairo) was the military centre of Egypt. Though detachments might be made to hold places of less importance, the armies were generally organised in and started from one of these base-camps. The organisation was at first tribal. North Arabian and South Arabian sections being formed in each great camp, and ere long many bodies of "clients," newly converted Syrian or Persian renegades, who were admitted to share the fortunes of the original invaders. In the second generation there was little difference between the original Muslims and their adopted comrades.

When the first rush of Conquest was over, and permanent dynasties, first the Ommayads and then the Abbasides, had replaced the elective Caliphs of the early years, the first signs of a change in military organisation were soon seen. The Caliph, like all oriental princes, took to keeping large bodies of royal guards, who both guaranteed the safety of his person, and formed the solid nucleus of any army with which he took the field. These mercenaries were at first Arabs, but before the end of the Ommayad dynasty strangers had already begun to replace them, and the Abbasides of the long-lived second caliphate line, regularly employed Soudanese Blacks, Persians, and above all Turks. The native Arabs had been found too factious and independent: the Turks, useful tools under a strong sovereign, ended by becoming their employers' masters, when the later Abbasides sank into debility, and like the Praetorian guards of Rome and the Mamelukes in Egypt, they became king-makers. But this disgrace was still far off in 750, when the first Caliph of the second dynasty mounted the throne.

THE CALIPHS' ARMIES

The Byzantine writers, who had two centuries of Arab warfare behind them when they wrote their accounts of the Caliphs' armies, have to distinguish between two sorts of collisions with the Saracen enemy. Comparatively rarely, and hardly ever after the year 800, the Caliph himself took the field with his household troops in addition to the *levée en masse* of the Muslims of Syria, Mesopotamia and Iraq. More usually the wars consisted of raids into the upland of Asia Minor by the Emirs of the frontier towns—Tarsus, Mejafarkin, Antioch, Mardin or Malatia, which it was the duty of the military governors of the East-Roman themes to ward off, or to avenge by similar raids into Cilicia or North Syria.

The emperors Leo and Constantine in their books describe the Saracens as composed almost entirely of mailed light horse armed with lance and javelin—only occasionally do we hear of black Soudanese archers—and unencumbered by wheel transport—all their baggage was carried by camels. They moved with extraordinary rapidity, and the governor who had to face a raid would do better by not attempting to follow their track, but rather by besetting the routes by which they must return to their own country. They had only the choice of a limited number of passes, and if provision was made for blocking each of these, the enemy must infallibly be intercepted. And he would be caught when loaded with plunder, and therefore unable to move with the same rapidity with which he had started. Of course if he should besiege a town, and not merely practise the normal circular raid, the circumstances would be altered, and an attempt should be made to fall upon him when he had settled down before the walls of the besieged place. But this would be exceptional.

The last great formal invasion of Asia Minor was that of the Caliph Al-Mutassim in 838, who penetrated as far as Amorium in Phrygia—but even this was only a raid on the very largest scale, in revenge for an irruption of the emperor Theophilus into Northern Syria in 836,—not a serious attempt to win new territory from the East-Romans. Al-Mutassim's father Haroun-al-Raschid had gone still further into Asia Minor in his campaign of 806, having taken Angora, and seen the waters of the Black Sea at Heraclea; but he too had made no attempt at annexation, and contented himself with imposing an ignominious peace on the Emperor Nicephorus. It may be said indeed that the famous defence of Constantinople by Leo the Isaurian in 717–718, when the formidable attack by sea and land of Muslemah and Soliman had suffered a decisive repulse, marks the end of the first period of Arab invasions, when the conquest of the whole eastern world was still inspiring the hopes of the Muslims. In later wars the *Jehad* might be preached, and the enthusiasm of "True Believers" might be called upon for a desperate effort: but their rulers were no longer fanatics, and preferred a favourable peace to the continuance of an effort which had failed.

In the ninth century the strength of the Caliphate began to decline, in the tenth it was so reduced that the East-Romans launched campaigns against it, and reconquered Cilicia, North Syria, and part of Mesopotamia. This falling off in offensive was caused by decay at the heart—a succession of weak caliphs, engaged in civil war with pretenders, lost control over the outlying provinces, whose governors became practically independent, and only assisted their sovereigns when it was convenient to them with men or money. At Baghdad itself the Turkish royal guards were continually indulging in mutiny, and not infrequently deposing a sovereign in order to finger the accession donative of his successor. The authority of the Abbasides was really confined to Iraq, and sometimes when a specially arrogant governor or vizier was asserting himself, it did not even extend to the walls of their palace. After the Seljuk Tribes had swept over western Asia in the later eleventh century; swamping the provincial dynasties which had preserved a nominal allegiance to the Caliphate, the phantom at Baghdad became a perfectly negligible quantity. The only wonder is that the line of the Abbasides continued to survive in lineal succession, till the Tatars of the 13th century starved the

last bearer of the title to death in his own treasure house (1258).

MOHAMMEDAN INSTITUTIONS: *see* ISLAMIC INSTITUTIONS.

MOHAMMEDANISM: *see* ISLAM.

MOHAMMEDAN LAW: *see* ISLAMIC LAW.

MOHAMMERAH, a town and port of South-west Persia situated in Lat. 30° 25′ Long. 48° 10′ on the right bank of the Karun river (*q.v.*) at the point where it enters the Shatt al Arab (*q.v.*). Until the beginning of the 19th century the old village of the same name lay on the left bank of the Karun on the island of Abadan (*q.v.*) opposite the present town.

The place first came into prominence in 1837, when it was attacked and demolished by the Turks on the ground that it was becoming a thriving commercial port to the detriment of Basra. Persia claimed an indemnity of one million pounds sterling: the Turks on the other hand claimed that both Mohammerah and Abadan were Turkish territory. The British and Russian Governments intervened to prevent war and by the Treaty of Erzerum (1847), Mohammerah and its anchorage, and Abadan island were allocated to Persia. One of the principal difficulties in effecting this settlement was the fact that in 1765 the Karun, which had hitherto entered the Persian Gulf by a separate channel via Marid, Qubban and the Khor Musa, left that channel and followed a small canal which had been dug to connect Marid with Mohammerah by the Bahmishir, then a branch of the Shatt al Arab, thus depriving Persia of the advantages of independent access to the Persian gulf. On the inclusion of Mohammerah and district in Persian territory they were constituted, administratively, a deputy-governorship under the provincial Governor of Arabistan (Khuzistan) with headquarters at Shushter; but in practice they were farmed out, or delegated to the ruling Shaikh of the Muhaisin section of the Chaab, the Shia tribe of Arabs inhabiting the region. Sir Khazaal Khan G.C.I.E., K.C.S.I., the present titular Shaikh, has always maintained most cordial relations with British representatives in the Persian gulf and Mesopotamia. A British vice-consulate has been established at Mohammerah since 1891.

During the Anglo-Persian War of 1857 the town was assaulted and taken by the British force under Sir James Outram and occupied until the conclusion of peace.

Mohammerah is connected by river with Ahwaz (105 m.); good motor roads connect the town with Ahwaz (80 m.), Basra (25 m.), Abadan (9 m.). It is in telephonic communication via Ahwaz with the rest of Persia, but not with Basra owing (1928) to diplomatic difficulties.

The only local product of importance is dates, which are exported in considerable quantities from the date-groves which line the Shatt al Arab and Bahmishir rivers. It is, however, a port of considerable importance, its imports averaging for the past three years over one million pounds sterling; exports about £200,000: representing respectively about 45,000 and 22,000 tons. 146 ships entered the port in 1925–6 of which 141 were British. The average rainfall at Mohammerah is 8 in. per annum, as compared with about double that amount at Masjid, Sulaiman, 120 miles north. The climate is hot but not unhealthy.

MOHAVE. The Yuman tribe farthest upstream on the Colorado river, where Arizona, California, Nevada adjoin. Similar to the Yuma, they suffered somewhat less from Caucasian contacts, and in 1910 over 1,000 remained. (*See* Kroeber, *Bur. Am. Ethn. Bull.* 78, 1925.)

MOHAVE DESERT, a name applied to that arid section of the "Great basin" which lies just north of the Colorado desert (*q.v.*). It includes much the greater part of San Bernardino county and the eastern portions of Los Angeles and Kern counties, Calif., and embraces an area of some 15,000 sq. miles. The Mohave desert is about 2,000 ft. above the sea in average altitude, but the entire area consists of a series of more or less nearly parallel ranges and intervening minor desert valleys. The mean annual rainfall is between 3 and 4 in.; the midday temperature during the summer ranges between 70° and 125° F.

See W. C. Mendenhall, "Some Desert Watering Places in South-eastern California and South-western Nevada" in the U.S. Geological Survey, *Water Supply Paper* No. 224.

MOHAWK. This easternmost tribe of the Iroquois (*q.v.*) or League of Five Nations, formerly in and about Mohawk valley, New York, now live to the number of over a thousand on reservations in Ontario. They were one of the smallest tribes of the confederacy, but perhaps the most aggressive, and Hiawatha, one of the two founders of the league, was a Mohawk.

MOHEGAN and **MOHICAN.** These cognate tribes, of Algonkin affinities, occupied respectively eastern Connecticut and much of the Hudson valley in New York. They were similar to the other Algonkin of the middle Atlantic and New England coast. Fenimore Cooper's *Last of the Mohicans* notwithstanding, mixed blood remnants of both tribes survive, respectively near Norwich, Conn., and Stockbridge, Mass., whereas other elements have lost their identity among the Delaware, Iroquois or other tribes.

MOHI, BATTLE OF: *see* SAJO, BATTLE OF THE.

MOHL, HUGO VON (1805–1872), German botanist, was born at Stuttgart on April 8, 1805, and was educated at Tübingen and at Munich. In 1832 he became professor of botany in Tübingen, a post which he retained until his death on April 1, 1872. Von Mohl was concerned chiefly with the structure of the higher forms, including both rough anatomy and minute histology. The word "protoplasm" was his suggestion; he recognized under the name of "primordial utricle" the protoplasmic lining of the vacuolated cell, and first described the behaviour of the protoplasm in cell-division. He also held the view now generally adopted of growth of cell-wall by apposition. He first explained the true nature of pits, and showed the cellular origin of vessels and of fibrous cells; he was, in fact, the true founder of the cell theory. His early investigations on the structure of palms, of cycads, and of tree-ferns permanently laid the foundation of all later knowledge of this subject: so also his work on *Isoetes* (1840). His later anatomical work was chiefly on the stems of dicotyledons and gymnosperms.

The most notable of Von Mohl's numerous papers were republished in *Vermischte Schriften* (1845). His important *Die Vegetabilische Zelle* appeared in 1851 (Eng. trans. 1852). *See* J. Sachs, *History of Botany* (1890); De Bary, *Botanische Zeitung* (1872), p. 561; *Proc. Roy. Soc.*, xxiii. 1.

MOHL, JULIUS VON (1800–1876), German Orientalist, brother of Hugo von Mohl (*q.v.*), was born at Stuttgart on Oct. 25, 1800. Having studied theology at Tübingen (1818–23), he abandoned the idea of entering the Lutheran ministry, and in 1823 went to Paris, at that time, under Silvestre De Sacy, the great European centre of Oriental studies. From 1826 to 1833 he was nominally professor at Tübingen, but continued his studies in London and in Oxford. In 1826 he was charged by the French government with the preparation of an edition of the *Shah Nama* (*Livre des rois*), which became his life-work. The first volume appeared in 1838; the seventh and last was left unfinished at his death, being completed by Barbier de Meynard. He resigned his chair at Tübingen in 1834, and settled in Paris. In 1844 he was nominated to the academy of inscriptions, and in 1847 he became professor of Persian at the Collège de France. He served for many years as secretary, and then as president of the Société Asiatique. His annual reports on Oriental science from 1840 to 1867, collected after his death under the title *Vingt-sept ans d'histoire des études orientales* (Paris, 1879), are an admirable history of the progress of Eastern learning during these years. He died in Paris on Jan. 3, 1876.

His wife Mary (1793–1883), daughter of Charles Clarke, had passed a great part of her early life in Paris, where she was very intimate with Madame Récamier. For nearly 40 years her house was one of the most popular intellectual centres in Paris. She died in Paris on May 14, 1883. Madame Mohl wrote *Madame Récamier, with a Sketch of the History of Society in France* (London, 1862).

See Kathleen O'Meara, *Madame Mohl, her Salon and Friends* (1885); and M. C. M. Simpson, *Letters and Recollections of Julius and Mary Mohl* (1887).

MÖHLER, JOHANN ADAM (1796–1838), German Roman Catholic theologian, was born at Igersheim, Württemberg,

on May 6, 1796. He studied at Tübingen, where, after taking orders, he began to lecture in 1822, becoming full professor in 1828. His most famous work, *Symbolik* (1832), defending Catholic doctrine against Protestant theologians, was perhaps the most effective of the polemical writings of its time, and provoked replies from Baur, Marheineke and Nitzsch. The feeling aroused in Tübingen by the controversy induced Möhler to remove (1835) to the Catholic atmosphere of Munich. He was dean of Würzburg when he died (April 12, 1838).

Möhler wrote *Die Einheit in der Kirche oder das Prinzip des Katholicismus* (Tübingen, 1825); *Athanasius der Grosse u. d. Kirche seiner Zeit* (2 vols., Mainz, 1827), besides the *Symbolik* (Eng. trans. by J. B. Robertson, 1843; 8th. ed., 1871–72, and *Neue Untersuchungen der Lehrgegensätze zwischen den Katholiken u. Protestanten* (1834). His *Gesammelte Schriften u. Aufsätze* were edited by Döllinger and his *Patrologie* by Reithmayr, in 1839.

See J. Friedrich, *J. A. Möhler* (Munich, 1894); Vigener, *Drei Gestalten aus dem modernen Katholicismus* (1926).

MOHMANDS, a Pathān (Afghān) tribe holding about 1,200sq.m. of hilly country N.W. of Peshāwar, in the North-west Frontier Province of India. This tract is hot, infertile and almost treeless, the hills being sparsely covered with low scrub, stunted palms and coarse grass. Water is scarce in summer, yet the lowlands are malarious. The harvests depend entirely on the rainfall. The whole of this region was claimed by the amīr of Afghanistan, but in 1893 he handed over most of it under the Durand Agreement to the Indian Government, which, however, gave a guarantee to the Mohmand clans, whose lands fell within the Durand line, that they should not lose by their severance from Kābul. These are known as the Assured Clans. Owing to their poverty, even more than to their pugnacity, the Mohmands have always been persistent raiders into British territory, and their forays necessitated punitive expeditions in 1851–52, 1854, 1864, 1879 and 1880, culminating in the campaign of 1897, when they joined in the general upheaval along the north-west frontier. Descending in force the Mohmands burnt Shabkadar, a village in British territory. Immediate counter-measures being imperative, British forces advanced from the Malakand and Peshāwar to effect a junction in Bajaur, a brigade being detached northward to attack the Mamund valley. This brigade was strongly opposed and retired with loss. It resumed the offensive, however, and defeated the Mamunds. Meanwhile the main force, heavily attacked, had repulsed the Mohmands. Those in the hilly hinterland submitted. But the Mamunds were not yet subdued and their valley had to be re-occupied, though they soon came to terms. British losses in their valley amounted to 282 men out of 1,200.

The Mohmands played some part in Afghān history after they had driven off the older inhabitants of their present seats in Kafiristan early in the 16th century. They joined in the great revolt of the Roshanīa sect in 1586 against the Mughals, and after its suppression retained their lands. Under the Abdāli rulers of Kābul a Mohmand chief became *sūbahdār*, "governor," of Sirhind province. More aristocratic by instinct than the Afghāns to the south, the power of their chiefs of clans is well-developed, but they have never recognized any supreme head of the whole tribe, and even within the clan faction is strong, succession to its headship being often divided and disputed. The Mohmands rule over a considerable mixed population of Hindus and Mohammedan traders and tenants, largely no doubt converts from the tribes they dispossessed. Their shrines are useful as sanctuaries for murderers, etc., but they are not especially fanatical. A through trade in females kidnapped from Swat, etc., assists some clans to live, in spite of priestly censure, and there is a similar trade in hides, rice, etc., but it is mostly in the hands of non-Mohmands.

MOHN, HENRIK (1835–1916), Norwegian meteorologist, was born at Bergen on May 15, 1835, and was educated at the Cathedral School in that town and at the university of Oslo. In 1861 he became observer at Oslo university, where in 1866 he was elected professor of meteorology and from 1866–1913 was director of the Norwegian meteorological institute which he had been largely instrumental in founding. He carried out much valuable meteorological work, collaborating in 1876–8 with the mathematician Guldberg in a study of the dynamics of the atmosphere and subsequently extending his investigations to the subject of storms, the meteorology and oceanography of the northern Atlantic, the climate of Norway, and use of the hypsometer. He died at Oslo on Sept. 12, 1916.

MOHR, KARL FRIEDRICH (1806–1879), German pharmacist, was born at Coblenz on Nov. 4, 1806, the son of a chemist. He studied under L. Gmelin, and, after five years at Heidelberg, Berlin and Bonn, returned to Coblenz to assist his father. He gave up business in 1857, and devoted himself to research work until 1863 when he returned to the university at Bonn, where he died, on Sept. 28, 1879. Mohr was the leading scientific pharmacist of his time in Germany; he was the author of many improvements in analytical processes. He invented the pinch-cock, the cork-borer, Mohr's balance for the determination of specific gravities and other pieces of apparatus. His methods of volumetric analysis were expounded in his *Lehrbuch der chemisch-analytischen Titrirmethode* (1855). His *Geschichte der Erde, eine Geologie auf neuer Grundlage* (1866), also obtained a wide circulation. In a paper "Über die Natur der Wärme," in the *Zeitschrift für Physik* (1837), he gave one of the earliest general statements of the doctrine of the conservation of energy.

See Kahlbaum's *Monographien aus der Geschichte der Chemie,* No. 8.

MOHS, FRIEDRICH (1773–1839), German mineralogist, born at Gernrode in the Harz mountains, was professor at Graz and at Freiburg, and, lastly, professor of mineralogy and superintendent of the imperial cabinet at Vienna from 1826 onwards. His great work was the *Grundriss der Mineralogie* (Eng. trans., *Treatise on Mineralogy,* by Wilhelm Haidinger, 1825). He died at Agardo, near Belluno, Italy, on Sept. 29, 1839.

MOHUN, CHARLES MOHUN, 4th BARON (*c.* 1675–1712), duellist, was the son of the 3rd Baron Mohun, who died in 1677 as the result of a wound received in a duel. The boy had no regular guardian, and before he was seventeen had become notorious for rowdyism, had fought a duel and had been tried on a charge of murdering William Mountfort, the rival of his friend, Richard Hill, who was in love with the actress Mrs. Bracegirdle. By an overwhelming majority he was found not guilty by his peers. This verdict has been severely criticized, notably by Macaulay, who saw in it merely a gross instance of class favouritism. But a careful examination of the evidence (in the *State Trials*) justifies the decision, and establishes the presumption that the fight was fair. In 1699 Mohun was tried for another alleged murder, but was acquitted unanimously. His boon companion, Edward Rich, earl of Warwick (1673–1701), who was tried on a separate indictment for the same crime, was found guilty of manslaughter. On Nov. 15, 1712, Mohun forced the 4th duke of Hamilton, with whom he had been at law for some years, into a desperate duel in Hyde Park in which both combatants were killed. Thackeray has utilized this incident in *Esmond.* On Lord Mohun's death the barony, created in 1628 in favour of his great-grandfather John Mohun (*c.* 1592–1640), became extinct.

See *The Whole Life and History of My Lord Mohun and the Earl of Warwick* (1711); J. Evelyn, *Diary and Correspondence;* Historical Mss. Commission, 11th Report, appendix v. (Dartmouth mss.); G. C. Boase and W. P. Courtney, *Bibliotheca cornubiensis* (1874–82); Howell, *State Trials;* and Colley Cibber, *Apology,* ed. R. W. Lowe (1889).

MOHUN, MICHAEL (*c.* 1625–1684), English actor, played at the Cockpit in Drury Lane before the Civil War. He served in the king's army, and emigrated. At the Restoration he returned with Charles II. and played a great variety of parts, usually as second to Charles Hart.

MOHUR, a Persian gold coin, used in India from the 16th century. Between 1835 and 1891 a gold coin, also called a "mohur," was struck by the Government of British India and was of the nominal value of 15 rupees. On the establishment of a gold standard in India in 1899 the British sovereign was declared legal tender and the mohur was superseded.

MOI, a name used collectively for the hill tribes of Tongking in Indo-China who are probably of mixed race with Mongolian, Indonesian and Caucasian blood (*see* MĀN). Generally speaking

their polity is one of pure democracy, the chief, if any, being elected. In marriage patrilineal endogamy is reported to be the rule, though exogamy is permitted in some groups. There are traces of polyandry, and of a matrilineal system of genealogy and inheritance. A man works for his bride in her father's house, and the heir of a dead man marries his widow. They seem to be Buddhist by religion, but venerate stones. The dead are in some places buried, in others exposed on platforms. Trial by ordeal takes the form of a diving test to see which can stay under the longer. Like the Karens they have a quasi-Biblical legend of the Creation, and they have a legend about Amazons who smelt copper. They shave the heads of their children habitually, and their own when in mourning, a trace, perhaps, of Hindu influence. Their medicine-men practise legerdemain, and cure sickness by "extracting" the cause in the form of "dirt." They have separate buildings for the unmarried, and the approaches to their villages are made under tunnels of thorn which can be cut down to block the way. They use a flexible sawing thong to make fire, piston-bellows, the gourd organ, and as weapons the crossbow and the gun-arrow, both of which may be used with poison.

MOIDORE, a corruption of the Portuguese *moida d'ouro*, literally, money of gold, the name of a gold Portuguese coin, coined from 1640 to 1732. This was of the sterling value of 13s. 5½d. It is the double *moida d'ouro*, of the value of 4,800 reis in 1688, that was current in western Europe and the West Indies for a long period after it ceased to be struck. It was the principal coin current in Ireland at the beginning of the 18th century, and spread to the west of England. At the same period it was current in the West Indies, particularly in Barbados. It was rated at 27s.

MOIR, DAVID MACBETH (1798–1851), Scottish physician and writer, was born at Musselburgh on Jan. 5, 1798. He studied medicine at Edinburgh university, and practised at Musselburgh until his death on July 6, 1851. He contributed prose and verse to the magazines, and particularly, with the signature of "Delta," to *Blackwood's*. A collection of his poetry was edited in 1852 by Thomas Aird. The famous *Life of Mansie Wauch, Tailor* (1828) shows his gifts as a humorist.

He also wrote *Outlines of the Ancient History of Medicine* (1831), and *Sketch of the Poetical Literature of the Past Half Century* (1851).

MOIRE. A textile fabric possessed of a distinctive "watered" or shaded ribbed effect produced by various methods of "finishing." A moiré or "watered" finish is generally applied to fine ribbed silk fabrics of the poplin type, though similar effects are also sometimes produced in cotton fabrics. Although a ribbed weave is more conducive to the development of a moiré or watered effect, similar effects can also be obtained with other weaves in fabrics of comparatively close and firm texture, and more especially in those produced from silk, artificial silk and mercerised cotton. The moiré effect results entirely from the varying angles at which the rays of light are reflected from the surface of the fabric.

Moiré effects are produced from two distinctly different methods of finishing. One of these produces the true moiré effect, known as "moire antique" and "moire Anglaise," which is a purely physical phenomenon. This "moire antique" effect is obtained by first damping the material and folding it with the face side inward, and with the two selvedges running together side by side. The cloth is then passed between heated cylinders and under considerable pressure. This is the more permanent of the two styles. The second is an imitation produced mechanically by means of engraved copper rollers. (H. N.)

MOISSAC, a town of south-western France in the department of Tarn-et-Garonne, 17 m. W.N.W. of Montauban on the Southern railway between Bordeaux and Toulouse. Pop. (1926) 3,807. The town owes its origin to an abbey probably founded in the 7th century by St. Amand, the friend of Dagobert. After being devastated by the Saracens, the abbey was restored by Louis of Aquitaine, son of Charlemagne. Subsequently it was made dependent on Cluny, but in 1618 it was secularized by Pope Paul V., and replaced by a house of Augustinian monks, suppressed at the Revolution. The town, which was erected into a commune in the 13th century, was taken by Richard Coeur de Lion and by Simon de Montfort. Moissac stands at the foot of vine-clad hills on the bank of the Tarn; it is divided into two parts by the lateral canal of the Garonne, which crosses the Tarn by an aqueduct a short distance above the town. The abbey-church of St. Pierre (15th cent.) has a porch of the 12th century, decorated with the finest Romanesque carving. St. Martin, the oldest of the other churches of Moissac, dates from before the year 1000. Moissac has paper mills, and trade in wines, fruit (grapes, peaches, etc.), vegetables and agricultural produce.

MOISSAN, HENRI (1852–1907), French chemist, was born at Paris on Sept. 28, 1852. He was educated in Frémy's laboratory and attended lectures by Sainte-Clair, Deville and Debray. In 1879 he was appointed to a junior post in the Agronomic institute, Paris, and was subsequently (1886) professor of toxicology and of inorganic chemistry (1889) at the School of Pharmacy, and of inorganic chemistry at the Sorbonne (1900). He was awarded the Lacase prize in 1887 and the Nobel prize for chemistry in 1906; he died in Paris on Feb. 20, 1907.

Moissan's first research was on a biological problem and dealt with the interchange of oxygen and carbon dioxide in leaves, but he soon went over to inorganic chemistry. His early work in this field was on the oxides of the iron group metals, and of chromium; he also made a careful study of the chromous salts. In 1884 he turned to the study of fluorene and prepared several new compounds, including phosphorus and organic derivatives. In 1885 he found that potassium fluoride could be dissolved in certain proportions in liquid hydrofluoric acid to give a solution which conducted electrolytically and which remained liquid at low temperatures. A year later by electrolysing this solution in a platinum tube using platinum-iridium electrodes he obtained for the first time the wonderfully active fluorine gas. He made a full study of the properties of the gas and of its combinations with other elements. In 1892 Moissan developed the electric arc furnace as a means of obtaining very high temperatures for experimental work; by its aid he prepared many new compounds, especially carbides, silicides and borides, and melted and volatilized substances which had previously been regarded as infusible. He prepared tiny artificial diamonds (*see* GEMS, ARTIFICIAL) by cooling very rapidly a solution of carbon in molten iron, and also discovered carborundum (silicon carbide). He studied the chemistry of the carbides and the action on them of water, and was led by the results to suggest that petroleum formation may be due to a similar process occurring in the earth. Moissan also prepared the hydrides of calcium, sodium and potassium, and found them to be non-conductors of electricity.

His published works include *Le four électrique* (1897) and *Le Fluor et ses composés* (1900), besides numerous papers, mainly in the *Comptes rendus* of the Société Chimique. A *Traité de Chimie minérale* (5 vols.) was published under his direction in 1904–06.

See A. Stock in *Berichte der Deutschen Chemischen Gesellschaft* (vol. xl., 1907); P. Lebeau, "Henri Moissan," in the *Bulletin de la Société chimique de France* (vol. iii., 1908); W. Ramsay, "Moissan Memorial Lecture," in the *Journal of the Chemical Society* (vol. ci., 1912).

MOJI, a town of Japan, on the Kyushu side of the Shimonoseki Strait. It is the starting-point of the Kyushu railway, and as there is abundance of coal in its neighbourhood, it has become a town of considerable importance. Pop. (1925) 95,087. It is the first Japanese port of call for many steamers from Europe.

MOJSISOVICS VON MOJSVAR, JOHANN AUGUST GEORG EDMUND (1839–1907), Austro-Hungarian geologist and palaeontologist, was born at Vienna on Oct. 18, 1839. He studied law in Vienna university and in 1867 entered the Geological institute, becoming chief geologist in 1870 and vice-director in 1892. He retired in 1900, and died at Mallnitz on Oct. 2, 1907. He paid special attention to the cephalopoda of the Austrian Trias. With Melchior Neumayr (1845–90) he conducted the *Beiträge sur Paläontologie und Geologie Oesterreich-Ungarns*. In 1862, with Paul Grohmann and Dr. Guido von Sommaruga, he founded the Austrian Alpine club.

His publications include *Das Gebirge um Hallstatt* (1873–76); *Die Dolomitrisse von Südtirol und Venetien* (1878–80); *Grundlinien der Geologie von Bosnien-Herzegowina* (1880) with E. Tietze and A. Bittner; *Die Cephalopoden der mediterranen Triasprovinz* (1882);

Die cephalopoden der Hallstätter Kalke (1873–1903); and *Beiträge zur Kenntniss der obertriadischen Cephalopodenfaunen des Himalaya* (1896).

MOKANNA (*al-Moqanna'*, the Veiled), the name given to Ḥakīm, or 'Aṭā, a man of unknown parentage, originally a fuller in Merv, who posed as an incarnation of Deity, and headed a revolt in Khorāsān against the caliph Mahdī. For about three years he sustained himself in the field against the troops of the caliph and for two years longer in his fortress of Sanam; then, reduced to straits in 779, he and his followers took poison and set fire to the fortress. He is a hero of Moore's *Lalla Rookh.*

MOKHA (Mocha, properly Makha), a town in Arabia on the Red Sea coast 13° 19′ N. and 43° 12′ E. Formerly the chief port for the Yemen coffee export, it has much diminished in importance. The coffee grown in the mountain districts of Haraz, Uden, and Ta'iz is now shipped at Hodeida or Aden, though the article retains the trade name of "Mocha." The town lies in a small bay 40 m. N. of Perim at the southern entrance to the Red Sea. The neighbouring country is an arid plain, the town being supplied with water by an aqueduct from the village of Muza, situated 16 m. E. This is probably the Muza of the Periplus, a great seat of the Red Sea trade in antiquity, which like other old Tehama towns, formerly seaports, has long since been left by the receding sea.

MOKSHANY, an agricultural town of Russia, in the province of Penza, in 53° 25′ N., 44° 35′ E. Pop. (1926) 9,786. Mokshany was built in 1535 as a fort to protect the country from the raids of the Tatars and the Kalmucks and is supposed to occupy the site of the Meshcheryak town of Murunza, mentioned as early as the 9th century.

MOLASSES, the syrup obtained from the drainings of raw sugar or from sugar during the process of refining. In American usage the word usually applies to both forms of the syrup, but in English usage the second form is more usually known as "treacle" (*see* SUGAR). The word, which in early forms appears as *melasses, molassos*, etc., is from the Port. *melaço*, or Fr. *mélasse, cf.* the late Lat. *mellaceum*, syrup made from honey (*mel*). The geological term "molasse" (Lat. *mollis*) is applied to the soft greenish sandstone of the district between the Jura and the Alps.

MOLAY, JACQUES DE (d. 1314), last grand master of the Knights Templars, was born at Molay (Haute-Saône), about the middle of the 13th century. He entered the order in 1265 at Beaune in the diocese of Autun, and set out for the East to take part in the defence of the Holy Land against the Saracens. About 1295 he was elected grand master of the order. After the Templars had been driven out of Palestine by the Saracens, De Molay took refuge with the remnant of his followers in the island of Cyprus. Here, he received a summons (in 1306) from Pope Clement V. to go to Paris. De Molay left Cyprus with a retinue of 60 followers, and made a triumphal entry into Paris. On Oct. 13, 1307 every Templar in France was arrested, and a prolonged examination of the members of the order was held. De Molay, probably under torture, confessed that some of the charges brought against the order were true. He was kept in prison for several years, and in 1314 he was brought up with three other dignitaries of the Temple before a commission of cardinals and others to hear the sentence (imprisonment for life) pronounced. De Molay then withdrew his confession. The king immediately gave orders that De Molay and another of the four, who had also recanted, should be burnt as lapsed heretics. The sentence was carried out on March 11 (or 19th), 1314.

For the charges brought against the Templars and the famous process in connexion with them, *see* TEMPLARS; J. Michelet, *Procès des Templiers* (1841–51) and Lavocat, *Procès des frères et de l'ordre du Temple d'après des pièces inédites publiées par M. Michelet* (1888); E. Besson, "Étude sur Jacques de Molay" in *Mémoires de la soc. d'émulation du Doubs* (Besançon, 1876); H. Prutz, *Entwickelung und Untergang des Tempelherrenordens* (Berlin, 1888).

MOLD (formerly *Mould*, Welsh *Y Wyddgrug*), market town of Flintshire, north Wales; on the L.M.S. railway (Chester and Denbigh branch), 11 m. from Chester. Pop. of urban district (1931) 5,133. At the north end of the town, Bailey Hill, partly natural and partly artificial, was an early fortification, and in old records is known as Moaldes, Monhault, or Monthault (*de monte alto*). Maes Garmon (the battlefield of Germanus) associated with early Christian legend, is about a mile west of Mold. Mold castle, probably built by Robert Monthault (*temp.* William Rufus), often changed hands in Welsh border-warfare.

MOLDAVIA, an autonomous republic of the Russian S.F.S.R., created in 1925. Area 8,288 sq.km. Pop. (1926) 567,306. It is situated on the left bank of the Dniester river, in the Ukrainian S.S.R. between 48° 12′ and 46° 32′ N. and 28° 30′ and 30° 06′ E. Autonomy was granted to the region because refugees from Bessarabia, after the occupation of that country by the Rumanians, expressed a desire for cultural independence. The population consists of Ukrainians 48·5%, and Moldavians 30·1%, the rest being Jews, Germans, Bulgarians, Poles, Czechs and Greeks. Its surface consists of a plateau sloping gently from north-west to south-east, deeply dissected by small streams with steep banks. The great number of ravines thus cut in the spongy loess are unfavourable to agriculture, especially as the heavy rainstorms of June and July often wash the surface soil away. The soil is chiefly black earth. The climate is extreme and most rain falls in very heavy storms during the growth of crops, so that the harvest is often damaged by these floods.

Agriculture thus labours under heavy disadvantages and has more than the usual element of chance: this has tended to prevent progress, and to lower social conditions. The chief crops are maize, wheat, rye and sunflower seed. Sugar beet, makhorka tobacco, fruits and vines are also cultivated. The number of cattle is poor compared with that in the rest of the Ukraine and diminished markedly after the bad harvest of 1924. Peasant industries to supplement the uncertain harvest are widespread and include the preparation of foodstuffs, flour-milling, oil-pressing and wine-making, the making of leather goods, especially boots and shoes, purses, etc., and the preparation of homespun garments. Clay and alabaster are also worked, and household utensils, wood, metal and pottery made. Manufactures are little developed.

Balta was at first declared to be the temporary administrative centre and a hope was expressed that ultimately Kishinev and the surrounding district would be detached from Bessarabia and joined to the republic, and that Kishinev would then become the administrative centre. In 1928, however, Birzulav (Birzula), a small town of 9,973 inhabitants, in 47° 45′ N., 29° 30′ E. was declared the administrative centre. The railway net is comparatively good, but roads are poor, and become impassable in flood time, those on the ravine slopes being sometimes completely washed away. The literacy rate is low and this militates against efforts to introduce scientific improvements to prevent the washing away of the surface of ravines. (*See* BLACK EARTH AREA.) The system of agriculture is mainly the traditional three-field system and agricultural implements are old fashioned and, in a population of fugitives, often lacking altogether. The migration of refugees into an area where the allotment of land to each peasant was already small, especially in view of the meteorological risks in this region, has created a very difficult problem.

The lack of diplomatic relations between Russia and Rumania and the consequent closing of the Dniester for trade between the two countries complicates the situation, and the region, which suffered severely during the war and civil war of 1914–20, and the famine conditions of 1921 and 1924, is in an unsettled social and economic condition. For the history *see* RUMANIA.

MOLDAVIA, a former principality of south-eastern Europe, constituting, after its union with Wallachia on the 9th of November 1859, a part of Rumania (*q.v.*).

MOLDAVITE: *see* TEKTITE.

MOLÉ, LOUIS MATHIEU, COMTE (1781–1855), French statesman, was born in Paris on Jan. 24, 1781. His father, a president of the parlement of Paris, was guillotined during the Terror, and Molé's early days were spent in Switzerland and in England with his mother, a relative of Lamoignon-Malesherbes. After his return to France Napoleon attached him to the staff of the council of state, and subsequently gave him many high offices. Except for a short term of office as minister of marine he was in opposition under the Restoration. He was foreign minister, without real power, for a few months in 1830, and

in 1836 he became prime minister and foreign minister. Personal and political differences rapidly arose between Molé and his chief colleague Guizot, and led to an open rupture in March 1837. Molé, supported by Louis Philippe, held his ground against the general hostility until the beginning of 1839, when the chamber was dissolved, but Molé resigned on March 31, 1839. After the revolution he sat in the Constituent Assembly, and in 1849 in the Legislative Assembly, where he was one of the leaders of the Right until the *coup d'état* on Dec. 2, 1851, drove him from public life. He died at Champlâtreux (Seine-et-Oise) on Nov. 23, 1855.

See P. Thureau-Dangin, *Histoire de la monarchie de juillet* (1884–92); and Robert Cougny, *Dict. des parlementaires français* (1891).

MOLÉ, MATHIEU (1584–1656), French statesman, son of Edouard Molé (d. 1614), who was for a time *procureur-général,* was educated at the University of Orleans. Admitted *conseiller* in 1606, he was *président aux requêtes* in 1610, *procureur-général* in succession to Nicolas de Bellièvre in 1614, and he took part in the assembly of the notables summoned at Rouen in 1617. He fought in vain against the setting up of special tribunals, or commissions, to try prisoners charged with political offences, and for his persistence in the case of the brothers Louis and Michel de Marillac he was suspended in 1631. In 1641 he was appointed first president of the parlement.

In the long conflict between Anne of Austria and the parlement, Molé played a conciliatory part. In the popular tumult known as the day of the barricades (Aug. 26, 1648) he sought out Mazarin and the queen to demand the release of Pierre Broussel and his colleagues, whose seizure had been the original cause of the outbreak. Next day the parlement marched in procession to repeat Molé's demand. On their way back they were stopped by the crowd. "Turn, traitor," said one of the rebels to Molé, seizing him by the beard, "and unless you wish to be massacred, either bring back Broussel or bring Mazarin as a hostage." Many magistrates fled; the remnant, headed by the intrepid Molé, returned to the Palais Royal, where Anne of Austria was induced to release the prisoners.

Molé failed to prevent the outbreak of the first Fronde, but he negotiated the peace of Rueil in 1651. He refused honours and rewards for himself or his family, but became keeper of the seals, and therefore retired from the presidency of the parlement. He died on Jan. 3, 1656.

The *Mémoires* of Molé were edited for the Société de l'histoire de France (4 vols., 1855) by Aimé Champollion-Figeac, and his life was written by Baron A. G. P. de Barante in *Le Parlement et la Fronde* (1859). *See* also the memoirs of Omer Talon and of De Retz.

MOLE, (1) a small animal of the family *Talpidae* (*see* below), (2) a mark, or stain, and particularly a dark-coloured raised spot on the human skin. This word, O.E. *mál,* is probably cognate with Lat. *maculus,* spot. Its meaning of stain is seen in the corrupted form "iron-mould," properly "iron-mole," a stain produced on linen or cloth by rust or ink, (3) a large structure of rubble, stone, or other material, used as a breakwater or pier (*see* Breakwater). This word comes from Lat. *moles,* a mass, large structure. The "Mole of Hadrian" is the mausoleum of that emperor, now the castle of St. Angelo, at Rome.

In zoology the name of *mole* is applicable to the common mole (*Talpa europaea*), a small, soft-furred, burrowing mammal, with minute eyes, and broad, strong fore-limbs, adapted for digging, belonging to the order Insectivora and the family *Talpidae.* In a wider sense may be included under the same term the other Old World moles, the North American star-nosed and other moles, the African golden moles of the family *Chrysochloridae;* and, in a still looser sense, to the Asiatic zokors, the African strand-moles, belonging to the order Rodentia, and the Australian marsupial mole.

The common mole is about six inches long, with a tail of one inch. The body is long and cylindrical, and, owing to the forward position of the front limbs, the head appears to rest between the shoulders; the muzzle is long and obtusely pointed, terminated by the nostrils; the minute eyes are almost hidden by the fur; the ears are without conches, opening on a level with the surrounding skin; the fore-limbs are short and muscular, terminating in broad, naked, shovel-shaped feet, the palms directed outwards; the hind-feet are long and narrow, and the toes have slender claws. The body is densely covered with soft, erect, velvety fur, generally black, with a greyish tinge. Albino and other colour varieties are known.

The food of the mole consists of earthworms, in pursuit of which it forms underground excavations. The mole is most voracious and, if deprived of food, succumbs in from ten to twelve hours. Moles take readily to the water. The sexes come together about the second week in March, and the young—generally from four to six in number—are brought forth in about six weeks.

Much misconception has prevailed with regard to the structure of the mole's "fortress," *i.e.,* the large breeding hillock, which is generally placed in bushes, or amid the roots of a tree; a good account, however, is given by Adams (*Mem. Manchester Lit. and Phil. Soc.* 1903, vol. 47). Moles are disliked on account of the way in which they spoil lawns and pastures, and they destroy large numbers of the useful earthworm; but they are useful in aerating and turning the soil. The mole is the most important wild fur-bearing animal of the British Isles (*see* Fur). The geographical distribution of the mole is very wide.

MOLECULE, CHEMICAL. The chemical molecule is usually defined as the smallest part that exists free in the gaseous form of a chemical substance. A very large number of chemical substances, however, have never been obtained in the gaseous form, and, in fact, many substances are incapable of existence except in the solid form. The compound chemical substance, alum, for example, decomposes on melting and exhibits no trace of volatility; it can be subdivided mechanically almost an infinite number of times without any change in chemical properties appearing, though it can be ultimately resolved by chemical processes into the five elementary substances, potassium, aluminium, sulphur, oxygen and hydrogen. Obviously there must be some stage in the subdivision of alum at which further subdivision will destroy the individual substance and reveal the presence of the elementary constituents: this ultimate stage is the stage of the molecule. A molecule thus represents the limit of subdivision of a substance at which the chemical properties are wholly retained.

Chemical science is not directly concerned with the absolute sizes of either molecules or atoms, all molecular and atomic weights being multiples of an arbitrary unit. The element selected as the standard was originally hydrogen, as the lightest known gas. For purposes of convenience (accessibility of measurement, etc.), the modern standard is the gas, oxygen, which is approximately 16 times as heavy as hydrogen. Taking oxygen as 16, the atomic weight of hydrogen is 1·008, which for most practical purposes is taken as unity. Though chemistry is concerned only with these relative weights, it is possible on chemical considerations to obtain some very approximate idea of the absolute weights of molecules and atoms. If one grain by weight of the colouring matter, fluorescein, is dissolved in 354 gallons of water, the yellow colour is just perceptible in a single drop of the solution. This drop contains 1/500,000,000th part of the original fluorescein. Though this dilution is at the visual limit of fluorescein detection, it is still very far from the molecular stage. If the single drop, however, is diluted with water a further four million million times, a drop of the resulting solution would contain a molecule of fluorescein, and it is known by chemical analysis that the fluorescein molecule is 332 times as heavy as a hydrogen atom.

In the early days of chemical science the distinction between atoms and molecules was not appreciated. John Dalton, the founder of the atomic theory, in 1808 regarded the atom as the smallest ultimate weight of both elements and compounds. He thus referred, for example, to the ultimate particle of the compound of nitrogen and hydrogen as an atom of ammonia. The term atom is no longer used in connection with compound particles, and is reserved solely for the ultimate particles of elements. Dalton assumed that the elementary gases were composed of individual atoms, and that chemical combination occurred simply atom to atom. In the same year J. L. Gay Lussac discovered the "law of simple multiple proportions by volume," which, in modern

terms, states that the gaseous volumes of substances taking part in a chemical change and the total change of volume, if any, are small integral multiples of a common factor of these volumes. In a very great number of cases it was known that the volumes of gases taking part in chemical changes were equal, and in 1811 Amadeo Avogadro put forward the hypothesis that equal volumes of gases under the same conditions contain the same numbers of particles. Avogadro used the term molecule in the sense in which Dalton had used the term atom, and distinguished the gas particle by the term integral molecule. The simple term molecule is now reserved solely for gas particles and ultimate particles of compounds. By means of this hypothesis as to gas particles, Avogadro was enabled to discern that the gas particles of nearly all the elements were made up of more than one ultimate particle or atom, the majority of the elements possessing diatomic particles or molecules. The molecules of hydrogen and chlorine, for example, were deduced to be double, on the ground that the gaseous hydrogen chloride they formed had double the volume of the hydrogen or chlorine used in the combination. Similarly, oxygen had a diatomic molecule, because the volume of water vapour was double the volume of oxygen used or obtainable from it, and nitrogen likewise, because ammonia gas was double the volume of nitrogen obtainable from it. Avogadro's hypothesis and his deductions therefrom were disregarded, and confusion about atomic and molecular weights prevailed in chemistry for nearly half a century. But the hypothesis was revived in 1858 by another Italian, Stanislao Cannizzaro, who showed that all known physical and chemical facts confirmed its validity, and that the inferential distinction made possible between atoms and molecules reconciled all the contradictory experimental results accumulated since the beginning of chemistry as a science.

Avogadro's hypothesis, that equal volumes of gases under the same conditions of temperature and pressure contain the same number of molecules, necessarily involves that the weights of equal volumes of gases are the relative weights of their molecules or that the ratio of densities of gases is the ratio of their molecular weights. The method of density is the fundamental method of determining molecular and atomic weights in chemistry, the atomic weight of an element being the smallest weight of it ever found in its molecular weight or in the molecular weight of any of its compounds. The method of gas or vapour density for determination of molecular weight is, however, inapplicable to the cases of elements and compounds that are not vaporizable under experimental conditions, and other methods have to be resorted to. Minimum values for molecular weight can be obtained for the majority of non-volatile compounds by the method of equivalents. For example, fluorescein combines by replacement of hydrogen with alkalis to form salts in the proportion of 332 parts of fluorescein to one equivalent of an alkali metal. As a molecule cannot contain less than one atom of hydrogen, the least molecular weight of fluorescein is 332. This method is in common use to determine the molecular weights of organic acids by the formation of silver salts. If the basicity of the acid is known, *i.e.,* the number of hydrogen atoms that are replaceable, the true molecular weight is equal to the apparent molecular weight multiplied by the basicity. This method of equivalents may be used for all compounds, whether they contain hydrogen or not. All that is required is the percentage composition of any one constituent of a compound, the minimum molecular weight being a hundred times the atomic weight of the constituent divided by the percentage of it in the compound.

Investigation of the properties of solutions has disclosed that an internal pressure called the osmotic pressure is set up in liquids by the presence of dissolved substances, such that this pressure is approximately equal to that exertable by the same weight of the substance if it existed as a gas and occupied the same volume as the solution. Comparison of osmotic pressures thus furnishes a method of determining relative molecular weights, by reference to such properties as are dependent on osmotic pressures. These properties are lowering of the vapour pressure of the solvent, elevation of its boiling point, depression of its freezing point, and lowering of its solubility for other substances. Comparisons of molecular weights by these methods are seldom more than approximately correct, but they are invaluable in deciding which multiple of the equivalent weight is the molecular weight. A limitation to this method is the fact that many substances are decomposed or dissociate into smaller parts on solution. Substances that dissociate on solution form electrolytes, solutions that conduct electricity and give rise to abnormally high osmotic pressures. S. A. Arrhenius in 1884 showed that the abnormality was due to ionization, each ion contributing to the osmotic pressure an amount equal to that of the non-ionized molecule, and the electrical conductivity being proportional to the number of ions. Measurements of conductivity thus supplement the osmotic pressure method and enable determinations of molecular weight to be made even for substances which dissociate on solution.

Where only the equivalent weight of a compound is known, valuable indications as to the true molecular weight may often be obtained by analogy with other similar compounds. These analogies are usually based on resemblances in composition, in valency of the constituent atoms, in constitution and the spatial distribution of the atoms or groups of atoms, and in crystalline form (isomorphism). (J. D. M. S.)

MOLE-RAT, the name of a group of blind burrowing rodents, typified by the large grey *Spalax typhlus* of eastern Europe, Western Asia and Egypt, which represents the Old World family *Spalacidae.* The mole-rats are characterized by the want of distinct necks, small or rudimentary ears and eyes, short limbs provided with powerful digging claws, and a rudimentary tail; they make burrows in sandy soil, and feed on bulbs and roots. Bamboo-rats (*Rhizomys*) from India and Burma, and *Tachyoryctes* from East Africa, differ by the absence of skin over the eyes, the presence of short ears, and a short, sparsely-haired tail. They burrow among tall grass, or at the roots of trees. Another group is the African family *Bathyergidae,* which contains the Naked Mole-rats of East Africa (*Heterocephalus*). (*See* RODENTIA.)

MOLESKIN, a term employed not only for the skin of a mole but also, from a real or fancied resemblance, for a stout, heavy cotton fabric of leathery consistence, woven as a satin twill on a strong warp. It is much worn by working-men, and is used for gun-cases, carriage-covers, and other purposes in which a fabric capable of resisting rough usage is desirable.

MOLESWORTH, MARY LOUISA (1839–1921), Scottish writer, daughter of Major-General Stewart, of Strath, N.B., was born in Rotterdam on May 29, 1839, and was educated in Great Britain and abroad. In 1861 she married Major R. Molesworth. Her first novels, *Lover and Husband* (1869) to *Cicely* (1874), appeared under the pseudonym of "Ennis Graham." Mrs. Molesworth is best known as a writer of books for the young, such as *Tell Me a Story* (1875), *Carrots* (1876), and *The Cuckoo Clock* (1877). She died in London on July 20, 1921.

MOLESWORTH, ROBERT MOLESWORTH, 1ST VISCOUNT (1656–1725), was the son of Robert Molesworth, a Cromwellian who made a fortune in Dublin. He supported William of Orange and in 1695 became a prominent member of the Irish privy council. In 1716 he was created a viscount. He was succeeded by his two sons, John, 2nd viscount (1679–1726), and Richard, 3rd viscount (1680–1758), the latter of whom saved Marlborough's life at the battle of Ramillies and rose to be a field-marshal. The 3rd viscount's son Richard Nassau (1748–93) succeeded to the title, which has descended accordingly.

A great-grandson of the 1st viscount, JOHN EDWARD NASSAU MOLESWORTH (1790–1877), vicar of Rochdale, was a well-known High Churchman and controversialist; and two of his sons became prominent men—WILLIAM NASSAU MOLESWORTH (1816–90), author of *History of England 1830–1871* (1871–73), *History of the Reform Bill* (1865), and *History of the Church of England* (1882); and SIR GUILFORD MOLESWORTH (b. 1828), an eminent engineer and economist.

MOLESWORTH, SIR WILLIAM, BART. (1810–1855), English politician, son of the 7th baronet, was born on May 23, 1810 in London. After succeeding to baronetcy in 1823, he studied at Edinburgh, Cambridge, Offenbach, Rome and Naples. On the passing of the Reform Act of 1832 he was returned to parliament

for the eastern division of Cornwall. He made the acquaintance of Grote and James Mill, and in April 1835 founded, in conjunction with Roebuck, the *London Review*, as an organ of the "Philosophic Radicals." After the publication of two volumes he purchased the *Westminster Review*, and for some time the united magazines were edited by him and J. S. Mill. From 1837 to 1841 he sat for Leeds, and acquired considerable influence in the House of Commons by his speeches and by his tact in presiding over the select committee on transportation. But his Radicalism made little impression either on the house or on his constituency. From 1841 to 1845 he had no seat in parliament, occupying his leisure time in editing the works in Latin and English of Thomas Hobbes of Malmesbury, a recreation which cost him no less than £6,000. In 1845 he was returned for Southwark, and retained that seat until his death. On his return to parliament he devoted special attention to the condition of the colonies, and was the ardent champion of their self-government. In January 1853 Lord Aberdeen included him in the cabinet as first commissioner of works, the chief work by which his name was brought into prominence at this time being the construction of the new Westminster bridge; he also was the first to open Kew Gardens on Sundays. In July 1855 he was made colonial secretary but he died on October 22. He married in 1844, but had no children, and the baronetcy passed to a cousin.

The titles of his speeches and works are given in the *Bibl. Cornubiensis*, vol. i. and iii. *See* also Mrs. Grote's *The Philosophical Radicals* (1866) and Mrs. Fawcett's *Life* (1903).

MOLFETTA, a seaport and episcopal see of Apulia, Italy, in the province of Bari, 16 m. N.N.W. of Bari by rail. Pop. (1921), 46,242. The old cathedral of S. Conrad is Romanesque. The old town is surrounded by walls; the new town is more spacious, and is an active seaport. The town was given by Charles V. to the duke of Termoli in 1522, and was sacked by the French under Lautrec in 1529. In 1640 the fief passed to the Doria, then to the Spinola family. Two miles south-west is the Pulo di Molfetta, a large circular depression in the plain, on the edge of which was an important neolithic settlement.

MOLIÈRE (1622–1673), the name taken by the great French actor and dramatist, Jean Baptiste Poquelin. He was born in Paris, probably in Jan. 1622. His certificate of baptism is dated Jan. 15 of that year, in the parish of St. Eustache. The place of his birth is disputed. Part of his boyhood and early youth was passed in a house known as the *maison des singes* at the corner of the Rue St. Honoré and the Rue des Vieilles Etuves, but in 1622 his father may have occupied another house in the same street. The *maison des singes* no longer exists, but there is extant the drawing of a pillar of the house which stood at the angle of the street, decorated with sculptures representing a group of monkeys playing about an orange tree. The monkey was traditionally the emblem of the comic actor. If Molière was not born in the *maison des singes*, his destiny was at least symbolically determined for him when his father moved to it a few years later.

Jean Poquelin, Molière's father, came of an old family of Beauvais which for generations had been engaged in the same trade. Jean Poquelin, upholsterer, and the son of an upholsterer, married Marie Cressé, the daughter of an upholsterer, and in 1631, when Molière was only nine years old, succeeded his uncle as *valet tapissier de chambre du roi*. Six years later he arranged that his son should have the reversion of this office. The young Molière was to go the way of his ancestors. There was nothing which pointed to unusual genius in the family, though Marie Cressé was clearly a woman of taste and method. She had a Bible, a copy of Plutarch's *Lives*, excellent furniture and a plentiful supply of linen. Jean Poquelin was of a shrewd and amiable disposition, with a faith in education which reminds us of M. Jourdain. But the books in his house belonged to his wife, and his supreme ambition was, undoubtedly, that his son should succeed him in the family business.

The biographers of Molière look for early signs and influences that might have turned him towards the theatre, but the evidence is extremely suspect. Grimarest (1705) tells us that Louis Cressé, the maternal grandfather of Molière had a passion for the stage and that he perfidiously advised Jean Poquelin to release his grandson from the shop and send him to the celebrated college of the Jesuits at Clermont. This story is extremely improbable. *Noblesse oblige.* Louis Cressé was himself an upholsterer. The college of Clermont, moreover, was hardly a preparation for the stage. It is more reasonable to believe that Jean Poquelin, of his own initiative and from a wise belief in the value of learning, decided that his son should have as good an education as possible in preparation for his duties at the court. There is no sign in Molière of any vocation for the stage till he left college as a young man of 20. The utmost we can say of him in early boyhood is that he had special opportunities of frequenting the theatre. One of the friends of Jean Poquelin, also an upholsterer, was one of the masters of the *Confrérie de la Passion,* and in the theatre of the Hotel de Bourgogne, which was owned by the *Confrérie,* the masters had a private box reserved for them and for their friends. This box was known as *le paradis,* and paradise it may well have been for the young Molière. There he would see, as a child, the tragedies of the period and the famous buffoons, Turlupin, Gaultier-Gargouille and Gros-Guillame, then at the height of their popularity. The father of Molière himself, moreover, inherited two boxes within the enclosure of the famous fair of St. Germain, the home of the *théâtre de la foire,* where in the first half of the 17th century Bary and Orvietan delighted the crowd with their burlesques.

Marie Cressé died in 1632, when Molière was only ten years old, and a year later Jean Poquelin married Catherine Fleurette. There is no evidence in support of the allegation that Catherine in any way disliked or neglected the children of Marie Cressé, and critics who have assumed that she served as a model for the odious step-mother in *Le Malade Imaginaire* betray more ingenuity than common sense. Catherine died within three years of her marriage, so that Molière knew her only between the ages of 10 and 13. It is difficult to establish when exactly he went to Clermont. The evidence is conflicting. Clearly, however, his education was at no time neglected. There can be no doubt of the pride and affection with which Jean Poquelin regarded the eldest child of his first marriage. The college at Clermont was attended by the sons of the best families in France, and Jean Poquelin must have had considerable influence, or the young Molière must have shown considerable promise, to secure admission. Molière at Clermont acquired a thorough grounding in the humanities. Terence is said to have been his favourite dramatist, and Lucretius was his chosen philosopher. Special attention was paid to the French language, and the masters cultivated in their pupils a love of poetry and the theatre, encouraging them to compose and to produce ballets and plays. The attendance of Molière partly coincided with that of his future patron, the Prince de Conti, though the prince was nearly eight years younger. Tradition, questioned in this as in so many other points by modern research, obstinately affirms that, with Chapelle, his friend in later years, and with Cyrano de Bergerac and others, he studied philosophy under the celebrated Gassendi. Gassendi, to the scandal of his contemporaries, was a champion of Epicurus and the most formidable adversary of Descartes. Whether Molière was actually a member of the group of privileged youths who had private lessons from Gassendi may be doubted, but there is no doubt at all concerning his studies in philosophy. He is said to have translated Lucretius. The translation is unhappily lost, but its existence is attested by several independent witnesses and is hardly open to doubt. The plays are enough to show that Molière was thoroughly familiar with the philosophic learning of the time. There is, on the other hand, nothing to justify the legend that Molière was ever at the Sorbonne, or that he studied theology. On leaving Clermont, however, he almost certainly studied law and was probably called to the bar in 1641.

MADELEINE BÉJART

The formal and academic education of Molière was now complete, and he was presumably expected to devote himself henceforth to his father's business. The question when exactly Molière first met Madeleine Béjart, a meeting which was decisive for his

career, has been much disputed. The likeliest hypothesis is that he met her in Paris immediately on leaving college. The Béjarts were near neighbours of the Poquelins in the Rue St. Honoré. Madeleine was already perhaps an actress, and certainly a subject of lively interest to her neighbours. She was 24 years of age. Four years previously she had been the mistress of the brilliant and adventurous Comte de Modène, and she was the mother of a child formally acknowledged by the count. She was clearly in no respect a safe companion for the inheritor of a respectable middle-class tradition; and, if Molière were already acquainted with her in 1642, Jean Poquelin would be glad of the very suitable opportunity which soon occurred of sending him away from Paris for a time. In 1642 Louis XIII. went to Narbonne, and, according to Grimarest, Jean Poquelin arranged for his son to accompany the royal household as *valet tapissier* and thus fulfil the duties which had been so carefully reserved for him by the arrangement made in 1637. There is no good reason to doubt the statement of Grimarest, and we may, therefore, assume that Molière had on this occasion his first view of the provinces where he afterwards wandered as an actor for 13 years.

The precautions of Jean Poquelin were in vain. Molière returned to Paris probably in the late summer of 1642, where he almost immediately abandoned his father's business, and adopted a theatrical career. On Jan. 6, 1643, he signed a document surrendering his right to the reversion of the post of *valet tapissier* secured to him six years previously, and acknowledging the receipt from his father of 630 livres. The money was to be spent for a purpose which for the moment was unspecified, but which was revealed six months later in the celebrated contract signed in the house of the Béjarts on June 30, 1643, by the founders of the *Illustre Théâtre,* a document which the *Comédie Française* regards as the first of its charters.

The enterprise with which Molière thus became identified was due to the initiative of the family of which Molière may henceforth be regarded as an adopted member, and particularly of Madeleine who was the leading spirit in the new company. Her father, Joseph Béjart, an official in the Department of Forestry, had died earlier in the year, leaving a widow with five children and a number of debts. Three of his children, Joseph, Madeleine and Geneviève, joined the new company, and the other members of the troupe were of a similar standing, persons of small degree in the estimation of Jean Poquelin and of a Bohemian inclination. Madeleine, who was to be the friend and adviser of Molière for 30 years, and always the business man of the company, was of an amiable and free disposition—generous, affectionate, loyal in her friendships, able and prudent in the management of her affairs. There is no proof that she was at any time his mistress, and it is clear, despite everything that has been written to the contrary, that she never attached any importance to that aspect of their relationship—if, indeed, it ever existed. Her affection for Molière was from the first maternal rather than passionate.

This brings us to the most obscure of the many problems which confront the biographer of Molière, and it may be well to dispose of it as briefly as possible before following him into his theatrical career. On Feb. 20, 1662, nearly 20 years after Molière first made the acquaintance of Madeleine Béjart, he married a young girl of 19, who subsequently became one of the most celebrated members of his company. The girl, known to her contemporaries as Armande Béjart, was generally said to be the daughter of Madeleine. His enemies went further than that. The anonymous biographer who in 1688 published a life of Armande under the title of *La Fameuse Comédienne,* insinuates that Madeleine, at the time when Armande was born, was too promiscuous in her loves to be sure of the paternity of the child, and Boulanger de Chalussay, author of *Elomire Hypocondre,* a libellous comedy on Molière published in 1669, is still more explicit. He definitely suggests that Molière was the father of Armande. A third witness is Montfleury, a rival actor of the Hotel de Bourgogne, who wrote to Louis XIV. in 1663 and accused Molière of marrying the daughter of his mistress, leaving the king to draw his own conclusions. The king's answer was clear and immediate. The libellous *Elomire Hypocondre* was suppressed, and Louis stood godfather to the first child of Molière and his young wife. No one of credit believed in 1662 that Armande was the daughter of Molière, but it is equally true that no one, so far as we know, disputed the allegation that she was the daughter of Madeleine. His enemies wished to believe it and his friends did not trouble to deny it. The sequel is all the more surprising. A hundred and fifty-nine years later, in 1821, Beffara, an ex-commissioner of police, searching among the registers of Paris, discovered the marriage certificate of Molière in the parish of St. Germain l'Auxerrois. In this certificate Armande is given not as the daughter, but as the sister, of Madeleine, by Joseph Béjart and Marie Hervé. This discovery seemed to dispose once for all of any doubt as to the parentage of Armande, and it was reinforced in 1863 by the discovery of a legal document dated March 10, 1643, in which Marie Hervé, the widow of Joseph Béjart, renounced for herself and her children an inheritance which, as we have seen, consisted mostly of liabilities. In this document reference is made to four children of Joseph and to an "infant not yet baptised," the infant, of course, being Armande, who was thus, in a legal document signed and witnessed 19 years before her marriage, stated to be the sister and not the daughter of Madeleine.

These documents, which seemed for a moment to settle the question, have, in the opinion of many respectable critics, only made it more mysterious. Marie Hervé, in the act of renunciation dated 1643, describes all her children as minors. Joseph and Madeleine, however, had already attained their full legal majority. Marie Hervé, moreover, when Armande was born, was at least 53 years old and she had not had a child during the eight previous years. More remarkable is the fact that Molière, who might have produced these documents and thus silenced his enemies once and for all, never apparently made the least allusion to them, but acquiesced in the tradition, unquestioned for 160 years after his marriage, that Armande was the daughter of Madeleine. The inference has been drawn that the documents were not such as would have borne too close an inspection. The hypothesis which has won most support, though it is contemptuously dismissed by some scholars, is that Madeleine, for reasons variously given, which cannot be discussed within the limits of this article, was at the time of the birth of Armande anxious to avoid confessing her maternity and that she therefore induced her mother to acknowledge the child as her own. It is unlikely that the real facts of the case will ever be ascertained. Neither the gossips of the time nor the critics of a later generation help us very much to determine the attitude of Madeleine herself to the marriage, but it is clear that throughout her life she takes a very special interest in Armande. Armande received at her marriage a dowry of 10,000 livres, which purported to come from Marie Hervé. But Marie Hervé was at that time penniless. It was almost certainly Madeleine, the only rich member of the family, who supplied the money, and ten years later she left to Armande the whole of her fortune. No satisfactory explanation has been given why Madeleine should thus favour the youngest of her sisters at the expense of all the other members of the family. On the other hand no convincing reason has been given why Madeleine, if Armande was her daughter, should have wished to conceal the fact.

In the face of all this conflicting evidence, the just critic must apply the principles of English equity. The documents must be accepted until they are definitely proved to be falsifications of the truth, and according to the documents Armande is the sister of Madeleine.

THE FIRST THEATRICAL VENTURE

The Illustre Théâtre.—The contract between the members of the *Illustre Théâtre* was of a kind that had been familiar to the theatrical fraternity since Charles VI. had accorded his royal protection to the *Confrères de la Passion* in 1502. Each of the associates contributed to the funds of the company, and enjoyed in return a share in the profits and properties. No member might withdraw or be dismissed except at four months' notice. The plays were cast and the affairs of the theatre managed by a majority vote of the company. Madeleine Béjart was, by a special

provision, entitled to choose her own part in every play, and it was stipulated that the heroes should be impersonated alternately by Molière and two other members of the company. The company leased for three years a tennis court near the Porte de Nesle, at a rental of 1,900 livres. While, however, the necessary structural alterations were being made, the company visited Rouen, and it was probably in that city in Nov. 1643 that Molière made his first appearance as a professional actor. In December the company returned to Paris and urged on the work at the tennis court. In particular, Léonard Aubry, of the king's Office of Works, was urgently pressed to complete in good time the paving of the road in front of the theatre.

The history of the *Illustre Théâtre* is obscure. Its repertory consisted mainly of tragedies long since forgotten, and the only authentic evidence we have of its fortunes is a record of financial embarrassment. In Dec. 1644 we find the company indebted to François Pommier for 2,000 livres, and Marie Hervé, who made herself responsible for this debt, had pledged her house to another creditor of the company for 1,100 livres. In Dec. 1644 the receipts and assets of the company were all earmarked for its creditors, and the lease of the theatre was cancelled on the 14th of the month. Undaunted by these crushing reverses, the company moved to the tennis court of the *Croix Noire* on the *Quai des Ormes,* without, however, changing its fortunes. In March of the following year Molière, who had previously pawned two handsome ribbons with a milliner for 291 livres, undertook to make good any deficit that might be incurred on their sale. He was unable to discharge this debt until 15 years later, on May 13, 1659, two days after the first performance in Paris of *L'Etourdi.* The financial troubles of the company culminated in March 1645 in the imprisonment of Molière for debt at the suit of the master-chandler who supplied the theatre with candles. François Pommier likewise obtained a warrant against him, and he seems also to have been detained at the suit of a certain linen draper for the sum of 240 livres.

Too little is known of the work of the *Illustre Théâtre* to justify a discussion of its dramatic achievements. The biographical interest of the venture lies rather in the attitude of the two families who were principally concerned. That of the Béjarts is clear enough. Marie Hervé, signatory of the act of association, with three of her children in the company, supported the enterprise to the limit of her resources. She regarded Molière as in a sense one of the family, and treated his liabilities as being on the same footing as those of her own children. What was the attitude of Jean Poquelin? He had finally acquiesced in his son's adventure, and had even supplied him with the money to buy a share in the company. But he made no effort to help his son while the company still persisted in an enterprise which to him must have seemed hazardous and even fantastic. When, however, it was clear that the adventure could go no further, he lost no time in coming to the rescue. Léonard Aubry, whom we have seen paving the way for the *Illustre Théâtre* in Dec. 1643, went bail for Molière on his imprisonment in 1645, and guaranteed that François Pommier should be paid for account of the debtor the sum of 320 livres in weekly installments of 40 livres until the debt was discharged. On Dec. 24, 1646, Jean Poquelin himself assumed this liability and further payments by Jean Poquelin are recorded, amounting in all to 1,965 livres. Molière discharged these debts as soon as he could, and 23 years later he was able, in turn, to lend his father 10,000 livres under cover of a third party, for the reconstruction of the *Maison sous les piliers des Halles.* There is certainly nothing in the financial or personal dealings of father and son which can be quoted to the discredit of either party, and there is no real ground for any of the legends in which Jean Poquelin figures either as a mortally injured father or a monster of avarice.

PROVINCIAL TOURS

The enterprise of the *Illustre Théâtre* had ended in disaster, and Jean Poquelin might reasonably have hoped that his son would now return to the business of his fathers. What followed might be regarded as a proof of genius or infatuation. Molière, having failed in Paris, decided to go into the provinces. We do not know exactly how he, or more probably the Béjarts, contrived to arrange the matter, but in Jan. 1645, within six months of its bankruptcy in Paris, we find all that remained of the company in the service of the Duc d'Epernon, governor of Guienne, at or near Narbonne. The second stage in the theatrical progress of Molière had begun, and for the next 13 years he was to wander from place to place in the southern provinces of France. This is the most legendary period of a legendary life. Every town within reach of his activities has since been anxious to claim a piece of him or contribute to his Odyssey, and the real facts are difficult to establish. His itinerary has been painfully reconstructed from the marriage and baptismal certificates of friends or members of the company, from applications for licences to perform, from receipts given on account of taxes levied for the poor, from evidence of his association with noble protectors or local authorities. The evidence is always intricate and sometimes contradictory, and it is impossible to do more than indicate the general results. The following is a list of the towns which were certainly visited by Molière in the years indicated: Narbonne, 1645; Toulouse, Albi and Carcassonne, 1647; Nantes, 1648; Toulouse and Narbonne, 1649; Narbonne and Agen, 1650; Grenoble and Lyon, 1652; Lyon and Montpellier, 1653; Montpellier and Lyon, 1654; Montpellier, Lyon, Avignon and Pézenas, 1655; Pézenas, Narbonne, Bordeaux and Béziers, 1656; Béziers, Lyon, Dijon and Avignon, 1657; Lyon, Grenoble and Rouen, 1658. The above list includes only the towns for which documentary proof can be quoted, and no doubtful or merely probable cases are included.

The Duc d'Epernon, with whom we find Molière at the beginning of his provincial career, was the first person of distinction effectively to recognize and encourage the genius of Molière. The actor, Dufresne, was titular head of the new company, and Madeleine was its tragic star. In 1653 Molière found a more celebrated protector in his old schoolfellow, the Prince de Conti. By that time Molière was undoubtedly the leader of the company. He acts as its representative, and with Madeleine is, in effect, its responsible manager. It had recently been strengthened by the acquisition of two new members, Mademoiselle de Brie and Mademoiselle du Parc, and it would seem that the patronage of the Prince de Conti, and the pension granted as a result of it, was at the outset due less to the genius of Molière than to the charms of Mademoiselle du Parc, of whom the prince's secretary became opportunely enamoured. The prince was at this time at the height of his brilliant career. Molière spent a good deal of time in his society, and they read and discussed plays together. The sequel to the friendship was unfortunate. The Prince de Conti became suddenly regenerate, and, from being the gayest of his peers, was shortly to come before the world as the ascetic author of a satire upon the stage in which Molière, as in the later libels of his clerical enemies, was to figure as a corrupter of morals and the enemy of grace.

The traditional picture of the life of Molière during his provincial wanderings requires substantial correction in many respects. The vivid picture given of the life of a strolling player in the *Roman comique* of Scarron has seriously misled the biographers. Molière was certainly not the vagabond of popular legend. His status was more that of a civil servant than a gipsy. His engagements to perform while the Estates were in session were in the nature of public contracts, and on these occasions he received substantial grants which more than covered his expenses. Thus in Feb. 1656 he received at Pézenas from the treasury of the Estates the sum of 6,000 livres, roughly equivalent in value to 50,000 gold francs to-day, and representing for most articles a purchasing power considerably greater at that time than at any period since the War. When the company was not subsidized by the local authorities, or fulfilling its duties as a pensioner of the Duc d'Epernay or the Prince de Conti, it was free to go on tour in the ordinary way. The box office receipts on such occasions might be considerable. It is true that by a law of 1609 no place in the theatre might, without a special authorization, be sold for more than ten sous. But the law of 1609 was practically a dead letter. Thus, in 1652 at the Hôtel de Bourgogne a place in the

pit cost 15 sous, and a place in the galleries cost 110 sous—equivalent in value to the price of a stall at Covent Garden today. These receipts, of course, were supplementary to the pension paid by the protector of the company, and to the special indemnities given for extraordinary performances during a festival. The company of Molière is estimated to have received such indemnities to the tune of 11,000 livres (over 80,000 gold francs) within two years while in the service of the Prince de Conti. The only authentic glimpse we have of the standard of living of the company during its provincial wanderings is the account given by d'Assoucy who, in 1655, was its guest for several months. D'Assoucy is loud in his praises of the good fare of the actors and their generous habit of life.

The attitude to Molière and his friends of the public authorities and of private persons is well-defined by La Bruyère: "The actor was disreputable in the opinion of the Romans and honourable in the opinion of the Greeks; we ourselves esteem them as the Romans, but we live with them as the Greeks." In other words, the actor, though in 1650 he was still in theory infamous and must normally renounce his profession in order to be admitted to the sacraments or to Christian burial, was in fact almost universally welcome and respected. The worthiest representatives of the Estates might be kept waiting while a prince conferred with his actor friends, and Molière is one of the few men of whom it has been recorded that he dined with Louis XIV. The status and prosperity of the theatrical profession was at that time steadily rising. In 1641 Louis XIII. had issued a decree affirming that the theatre should henceforth be regarded as a source of innocent amusement to his subjects, and likely to distract them from evil pursuits; that actors should not be blamed for the exercise of their profession, and that it should not in any way prejudice their public intercourse.

For Molière the dramatist these were mainly years of observation and preparation. The repertory of the company would seem to have consisted mainly of contemporary French tragedies, of farces from the Italian and tragi-comedies from the Spanish. As an author Molière was as yet an apprentice. In 1655, before the Prince and Princess de Conti, he appeared in the *Ballet des Incompatibles,* to which he may have contributed some verses, and shortly afterwards, at Lyon, he produced *L'Etourdi,* the first of his authentic plays. Two years later came the first performance of *Le Dépit Amoureux,* given at Béziers in 1657. It was at this moment, when Molière was beginning his career as an author, that the Prince de Conti, in the throes of his pious conversion, intimated that he could no longer reconcile it with his conscience to be a patron of the drama.

RETURN TO PARIS

Molière returned to Paris in 1658 after his long absence. Thirteen years in the provinces had given him a thorough command of the arts and crafts of the theatre, secured for him the leadership of a devoted company, and provided him with a repertory which included two full-length plays of his own, and, probably, a number of small farces and sketches on which he was afterwards to draw during the next 14 years of production and authorship. He approached Paris by way of Rouen, from which he made a number of secret visits to the capital to prepare the way for his return. Who it was who gave Molière his introduction to the court is unknown. Possibly it was Mazarin, who might have heard of Molière through the Prince de Conti or through the painter, Mignard, who had met Molière at Avignon in 1657, and had there started with him a life-long friendship. All that we know for certain is that in the spring of 1658 Molière was in Rouen, and that, on Oct. 24 of the same year, under the protection of the Duc d'Orleans, he appeared before the king and his court in the guardroom of the Vieux Louvre. Loyal to his passion for tragedy, he played on this decisive occasion the *Nicomède* of Corneille. Among the spectators were the royal tragedians of the Hôtel de Bourgogne, who had often played this tragedy themselves, and with whom Molière was so shortly to be engaged in a bitter rivalry. The most devoted friends of Molière are lukewarm in their references to his tragic powers. The most they could say of his performance in *Nicomède* was that it did not displease the audience, and that the women of the company were excellent. At the end of the play Molière came forward, thanked the king for his graciousness, excused the shortcomings of himself and his company, with a judicious reference to the royal players whom they could not hope to excel, and asked permission to present one of the small entertainments with which he had regaled the provinces. We have only a brief summary of this little speech, but it was apparently made in the most felicitous terms, and the farce of *Le Docteur Amoureux* which followed it, but which unfortunately is not extant, still further pleased the king and his court. Louis XIV., as a result of the performance, arranged for Molière and his company to share the Salle du Petit Bourbon with the famous Italian comedians under Scaramouche, and it was there that in Nov. 1658 Molière began a series of productions which included a revival of his own provincial successes, *L'Etourdi* and *Le Dépit Amoureux.*

Molière was now 37. He had overcome the material obstacles to the career he had chosen. He was admittedly a comic actor of merit and an author who, on the lines of the old classic farces and of the more recent Italian models, could write a play of intrigue with a blend of exuberance and discretion peculiarly his own. In 1658, however, we cannot fail to admire with respectful astonishment the discernment of Louis XIV., who decided so quickly and on such slender grounds that this was a man to be watched and encouraged. *L'Etourdi* and *Le Dépit Amoureux* were popular successes and resulted in substantial profits for each member of the company, and they were equally successful when played before the king and his court in the spring of 1659. The dexterity of the plots, the easiness of the dialogue, and the excellence of the acting put these productions in a class apart from any comic plays yet produced on the French stage, with the single exception of the *Menteur* of Corneille, produced over 16 years previously. But these plays were in substance a clever exploiting of the conventional situations and characters of an ancient theatre. It was not till Nov. 1659 that the comic genius of Molière found its first individual expression in *Les Précieuses Ridicules,* and posterity has confirmed the verdict of the anonymous old gentleman who rose from his seat in the pit and cried out in his excitement: "Courage, Molière! Voilà la véritable comédie."

Les Précieuses Ridicules.—This is the first, and perhaps the most perfect, comedy of manners. It has been maintained that Molière wrote it or an early version of it during his provincial wanderings, but the evidence for so unlikely an hypothesis is inadequate. It was aimed directly at the capital. The brilliant salon of the Marquise de Rambouillet had begun under Louis XIII. as a legitimate protest against the brutal and illiterate society of the *Frondeurs.* It included a company of wits, poets and writers of memoirs who were to make the period illustrious. By the time Molière arrived in Paris, however, it had elaborated a code of gallantry, a standard of literary values, and a system of social etiquette in comparison with which the most eccentric affectations of the aesthetes of the last decade of the 19th century in England would seem the sports of an Arcadian simplicity. Critics like Boileau secretly appreciated its absurdity, but no one dared to attack so distinguished a coterie at the height of its vogue. It was left for Molière, newly arrived in Paris, with one foot precariously on the ladder of success, to invite this peculiar world to laugh at its own discomfiture. The sensation was immediate. The more discerning of the coterie admitted its justice, and applauded its genius. Madame de Rambouillet herself was present at the first performance, and Ménage, hitherto devoutly precious, declared on leaving the theatre that "we must now burn what we have adored, and adore what we have burned." Other members of the precious sect, however, were less amenable. The first performance was given on Nov. 18. The king and his brother were absent from Paris, and among those hit by the satire was a cabal sufficiently powerful to intrigue successfully against its repetition. The ms. was sent to the king, who thus became arbiter of the dispute, and he decided at once in its favour. The play was repeated on Dec. 2, before a crowded house at double prices. Molière returned often to his imitations of the classic farce; he wrote

many ballets to please the public and the court. But henceforth the principal events in his life are his comedies of observation and satire. His career henceforth is mainly a record of the bitter controversies excited by these plays, and his own persistent struggle for the freedom of the comic art. For the moment the omens were good. It is true that Thomas Corneille, writing to the Abbé de Pure, author of a tenth rate tragedy, regarded the success of *Les Précieuses Ridicules* as "sufficient proof that Molière and his friends are only capable of presenting trifles of this kind," and that the tragedians of the Hôtel de Bourgogne, already taking alarm, were openly contemptuous of their rivals. But there were 32 performances of *Les Précieuses Ridicules* between Dec. 2, 1659, and Easter 1660. People came to Paris from 20 leagues' distance to see the play, and the king on his return from the Pyrenees witnessed it on three separate occasions in the summer and autumn of 1660. On the third occasion he accorded the company a grant of 3,000 livres.

At the Palais Royal.—*Les Précieuses Ridicules* was followed in May 1660 by *Le Cocu Imaginaire*. Posterity feels that this was a retrogression. The public of his own day, however, was all applause, and the king was pleased to witness it on no less than nine occasions. Molière was, meanwhile, in danger of losing his theatre. M. Ratabon, in charge of building operations at the Louvre, began to demolish the Salle du Petit Bourbon in which the company of Molière was housed. He gave no warning to the actors, either from malice or more probably from negligence. The king at once intervened, and assigned to Molière the Salle du Palais Royal, in which he remained until his death in 1673. The rival companies of the Marais and the Hôtel de Bourgogne seized this opportunity to approach the members of the company of Molière with advantageous offers; but according to Lagrange: "all the actors loved M. Molière, their chief, who, in addition to his extraordinary merit and capacity, was of so honourable a nature and so charming a disposition, that they swore to follow his fortunes and never to abandon him whatever proposal might be made to them or whatever advantage might be offered them elsewhere." Even Mademoiselle du Parc, who, less loyal than her companions, had been enticed to the Hôtel de Bourgogne a short time before, had since returned to Molière.

The first production of Molière in the new theatre of the Palais Royal was *Don Garcie*, his only tragedy. We have noted before the obstinate devotion of Molière to the tragic muse. The *Illustre Théâtre* had been founded with a special view to the tragic gifts of Madeleine, and Molière on his return to Paris, had chosen to make his first appearance before the king in a tragedy. In 1659, during his first season at the Salle du Petit Bourbon, Molière presented no less than five tragedies of Corneille. All of them were failures and had to be abandoned in favour of *L'Etourdi* and *Le Dépit Amoureux*. Thomas Corneille describes the tragic acting of Molière and his friends as "detestable." *Don Garcie* was a final experiment, and, after endeavouring for nearly three years to obtain for it the favour of the king and the public, Molière at last accepted the verdict of his contemporaries. He never published the play and the fact that he afterwards incorporated some of its best verses in *Le Misanthrope* may be taken as a proof that he came to regard it as a lost cause. He did not, however, abandon tragedy without a struggle and some bitterness of spirit. He had ideas on the subject of tragic declamation which were wholly opposed to the feeling of the time and to the essential character of the French classical school. He pleaded for a greater simplicity of phrase and diction, and for a more natural and less organized emotion. His own views are expressed in *L'Impromptu de Versailles*, a direct attack upon the tragedians of the Hôtel de Bourgogne with which in Oct. 1663 he supported the last production of his own tragedy, and which reminds us in places of Hamlet's advice to the players at Elsinore. *Don Garcie* leaves us convinced that heroic tragedy in the manner of Corneille and Racine was incompatible with his genius, but it leaves us also wondering whether Molière might not have been a successful author of tragedy in the Elizabethan manner, with its mingling of tragic and comic scenes.

L'Ecole des Maris.—The failure of *Don Garcie* was more than balanced by the brilliant success of *L'Ecole des Maris*, produced on June 24, 1661. This play is a more considerable achievement than *Les Précieuses Ridicules*, being a comedy not of manners, but of character. Two rival conceptions of the education of women are opposed, and judgment given in favour of freedom and a reasonable indulgence. Each of two brothers is entrusted with the protection of two young girls, and each of them desires to marry his ward. The one mistrustfully prohibits all amusements, and endeavours to coerce youth into conformity with the tastes and inclinations of middle age. The other allows all innocent liberties and uses no constraint. The first loses and the second wins his wife. The friends of the author might see in the play a biographical significance not yet clear to the public; Molière, 40 years of age, was about to marry Armande at 19. Already he had asked for and obtained the right to two shares in the company which were to be accorded "to him and to his wife if he should marry."

From June 24 to Sept. 11 *L'Ecole des Maris* was played daily. The author was meanwhile, at the special request of the king, writing the *comédie-ballet* of *Les Fâcheux*, which was performed on Aug. 17, 1661, at a reception given to the king and his court by Fouquet in the gardens of Vaux. Le Brun painted the decorations; Torelli was engineer; La Fontaine contributed verses; Le Notre designed the gardens; while Molière exhibited for the delight of the court his famous gallery of bores, each of whom might be matched with an original in the brilliant audience. The thread on which Molière strung the episodes of the ballet was of an admirable simplicity. A pair of lovers desiring a quiet rendezvous are interrupted by a succession of intruders, each of them more tediously disconcerting than the last. Louis XIV. after the performance drew the author's attention to a famous bore whom he had omitted to present, by name Soyecourt, his own Master of the Chase, and Molière, in a subsequent revival of the play, made good this omission with the assistance, it is said, of the victim himself.

MARRIAGE

The unfortunate marriage of Molière with Armande Béjart took place on Feb. 20, 1662. We have already alluded to the circumstances of the marriage and the problems it presents. The character of Armande and her relations with Molière have been the subject of even more discussion than her parentage. It is again impossible to go into the details of the controversy. There can be little doubt that Armande is the "petite Menou" who six years previously as a child had taken the part of Ephyre in the *Andromède* of Corneille while the company was in the provinces. The promiscuous infidelities with which she is charged by the author of *La Fameuse Comédienne* can be safely dismissed, but there can be no doubt whatever that she gave Molière frequent and just cause of complaint. She was greedy of pleasure and spoiled with flattery. She had small regard for her husband's position. Molière was surrounded by enemies who did not scruple to use his private troubles to discredit him, and the least we can say of Armande is that she did not show him the loyalty he had a right to expect. There was a fundamental incompatibility between them, which Molière subsequently idealized in the encounters between Alceste and Celimène. The uneasiness of their relations was such as might have been expected to arise between a sensitive man of genius in middle life and a capricious girl whom everyone, including her own husband, had helped to spoil from the time she was a child of ten. It is difficult to date the various estrangements and reconciliations between them. There was certainly a long period (1666–71) during which they were in effect separated, and in Aug. 1667 Molière took a house in Auteuil where he lived with his friend Chapelle, and apparently saw his wife only at the theatre. Even then, of course, they must have been in constant touch with one another professionally. In 1671 there was a last effort to resume life together, and when Molière died in 1673 they were inhabiting the same house in the Rue de Richelieu. The first part given by Molière to his wife was that of Elise in *La Critique de l'Ecole des Femmes*. Her talent as an actress was much admired, and contemporary writers all bear witness to her vivacity and charm. Molière himself has painted

her portrait delightfully in Lucile of *Le Bourgeois Gentilhomme.* After his death she married a second-rate actor, Guerin d'Estriché, who ruled her firmly and with whom she appears to have been entirely happy. There were three children born to Molière, a son on Jan. 19, 1664, who died nine months later, a daughter on Aug. 4, 1665, who survived, and a second son on Sept. 15, 1672, who died within a month.

L'Ecole des Femmes.—On Dec. 26, 1662, ten months after his marriage, Molière produced *L'Ecole des Femmes,* a companion comedy to *L'Ecole des Maris.* With the production of this play he enters upon a more militant period of his career. Hitherto he had excited only the jealousy of professional rivals and the resentment of a coterie. Henceforth he had to reckon with serious charges of license and impiety. Socially the play was more startling than the modern critic can easily realize. It anticipated the modern feminist attitude to male jealousy by over two centuries. Molière was to suffer all the tortures of a man infatuated with a young wife of whom he could never be sure, and in *L'Ecole des Femmes* he stages his own misfortunes. No one has written of jealousy with a finer detachment or a more delicate sense of the moral and social issues involved than Molière. The author of *L'Ecole des Femmes,* regarding himself with comic detachment, takes his own weakness for a subject. In the same way we shall see him later on, in the hands of the doctors, using his own illness as a theme for one of his gayest comedies.

L'Ecole des Femmes ran continuously from Dec. 1662 to Aug. 1663, except for a short break at Easter, and Molière, taking the offensive against his critics, wrote a brilliant postscript to the comedy in one act, dedicated to the queen mother, in which he ridiculed his detractors. The new play, entitled *La Critique de l'Ecole des Femmes,* provoked a whole series of rejoinders. The two most important of them were *Zélinde, ou la Critique de la Critique* by de Visé, and the *Portrait du Peintre* by Boursault. The latter play was performed at the Hôtel de Bourgogne and witnessed by Molière himself, who replied with *L'Impromptu de Versailles,* to which allusion has already been made. Modern readers may look in vain for the irregularities of form and impieties of substance alleged by the critics of Molière. The main attack was delivered upon the scenes in which Arnolphe threatens Agnes with the cauldrons of hell if she should ever deceive him, and catechizes her upon her deportment with the enterprising Horace. "There is nothing more scandalous than the sixth scene of the second act," says the reformed Prince de Conti in his *Traité de la Comédie et des Spectacles.* There is no doubt that the implicit mockery by Molière of a falsely puritan conception of conduct and his broad views on the freedom of women and the reasonable confidence which should be placed in their discretion profoundly disconcerted his contemporaries.

RISING OPPOSITION

Tartuffe.—The next two plays were occasional: *Le Mariage Forcé* (Feb. 15, 1664), an impromptu farce with a ballet, for which Lulli wrote the music, and in which the king himself danced as an Egyptian, and the *Princesse d'Elide* (May 8, 1664), hastily produced to form part of the festival of *Les Plaisirs de l'Ile Enchantée* at Versailles. More important was the inclusion by Molière among *Les Plaisirs de l'Ile Enchantée* of a first performance of the first three acts of *Tartuffe.* The production of these three acts was the beginning of a violent and obstinate struggle in comparison with which the controversy over *L'Ecole des Femmes* was no more than a preliminary skirmish. The king was driven into a position which as clearly indicates his own admiration of the play as the strength of the opposition it aroused. Molière pleaded in vain that *Tartuffe* was a satire upon a false and not a genuine devotion, as he had on a previous occasion pleaded that *Les Précieuses Ridicules* was a satire upon the false and not the genuine exquisites. The satire went too nearly home, and not even Louis XIV. dared publicly to license an indictment of religious hypocrisy with which he secretly concurred. He found it necessary to forbid the public performance of *Tartuffe.* Lest, however, his private opinion of the play should be misunderstood, he invited Molière to Fontainebleau on July 21, and *Tartuffe* was read to an audience which included Cardinal Chigi, legate *a latere* of Pope Alexander VII. The royal approval, even though supported by the toleration of a cardinal legate, did not, however, suffice to silence the opposition. Pierre Roullé, vicar of St. Barthélemy of Paris, in a pamphlet addressed to the most glorious king in the world, after describing Molière as a demon in human flesh and trusting that he would ultimately pass through earthly to eternal fires, congratulated his majesty on his decision to "suppress, destroy, suffocate and burn" the offending work. Molière protested against this violent attack in the first of the "placets" to the king, which afterwards appeared as prefaces to the play. The author in this "placet" expresses his entire confidence in the royal support. Meanwhile, the reading parties at court continued, and in July 1664 the first three acts of the play were performed at the house of the Duc d'Orléans in the presence of the king, the queen and the queen-mother, while in Nov. 1664 the whole five acts were played before the Prince de Condé, and repeated in Nov. 1665. For another two years Molière persistently continued to plead for a public performance, and he at last obtained the royal consent subject to certain emendations designed to make it clear that no general attack upon the clergy was intended. But the battle was not yet won. Molière amended the play, which was publicly produced at the Palais Royal on Aug. 5, 1667. The king, however, was unfortunately absent in Flanders, and on the day following the production of the play, the president of the *parlement* closed the theatre and tore down the posters from its walls. Molière thereupon wrote his second "placet" in which he went so far as to declare that he would retire from the stage "si les Tartuffes ont l'avantage." The "placet" was taken to the king in Flanders by two members of the company. The messengers of Molière were well received. The king promised to examine the new version of the play on his return and, if possible, to authorize its performance. But that was easier said than done, even by the king of France. The archbishop of Paris had on Aug. 11 prohibited anyone in his diocese from presenting, reading, or hearing the comedy, either in public or private, under pain of excommunication, and the king on his return to Paris did not venture to license its production. Molière was persuaded not to carry out his threat of retirement, but he had to wait for another 18 months before the public performance of the play was finally authorized on Feb. 5, 1669. Its success was immediate and prolonged.

Le Festin de Pierre.—Meanwhile, *Le Festin de Pierre,* produced on Feb. 15, 1665, had been denounced as the work of an atheist, without respect for God or the nobility, and, like *L'Ecole des Femmes* and *Tartuffe,* had become the occasion of several contemporary pamphlets. The king cannot fail to have been embarrassed by this further outcry. He did not, however, prohibit the public performance of the play, though it is more than probable that he advised the suppression of certain passages and dissuaded Molière from continuing the run of it after the Easter vacation. The play, though successful, was not revived, nor was it printed during the life of Molière. The scene which most infuriated the critics of *Tartuffe* was that in which Don Juan brings his infamies to a climax by assuming the mask of virtue. The scene between Don Juan and the beggar was considered to be so shocking that it was omitted from the early versions of the play, and great exception was also taken to the philosophic discussions between Don Juan and his valet. It is, again, not very easy for a modern reader to understand the critics of Molière. Much of the fury inspired by *Don Juan* seems to have been due to a false association of the author with the sentiments of his hero. The play was also construed by some of its critics as a deliberate attack upon the *noblesse.* Hitherto, as in *La Critique de l'Ecole des Femmes* Molière had portrayed only a foolish marquis. In *Le Festin de Pierre* he portrayed a wicked one. The king, once again, allowed no doubt to subsist concerning his own attitude to the play. *Le Festin de Pierre* was produced in Feb. 1665. In August of that year Louis XIV. summoned Molière to St. Germain, granted him a pension of 6,000 livres, and took over the company from his brother. Molière and his players were henceforth known as the "Troupe du Roi."

The first play produced by Molière as head of the king's com-

pany was to bring him further enemies. *L'Amour Médecin,* an impromptu *comédie-ballet* written and produced in five days, pleased the court and the town, but the medical profession now had definite warning that Molière, like his own Don Juan, was incorrigibly *impie en médecine.* The first performance took place at St. Germain on Sept. 15, 1665. From 1665 onwards, as the health of Molière declined, his satires against the doctors became more frequent and more effective. There is no need to seek for any private reason for these attacks. Nine-tenths of the science of medicine in the 17th century was pure grimace, and Molière, with his keen eye for the charlatan in art, science or religion, could not fail, as he came to know them better, to add the doctors to his gallery of impostors.

For the last two years Molière had been encouraging the young Racine. The two men had little in common, being antipathetic in personal disposition as in their genius. Molière had, nevertheless, been the first to recognize the talents of the young author, and had not only helped him with criticism and advice in the preparation of *La Thebaide,* but accepted the play when the tragedians of the Hôtel de Bourgogne hesitated to produce it. *La Thebaide* was produced at the Palais Royal on June 20, 1664. Shortly afterwards Molière accepted a second play of Racine, and *Alexandre le Grand* was produced at his theatre on Dec. 4, 1665. Racine, however, was not satisfied with the acting. He does not seem to have made any complaint or suggestion to Molière on the subject, but on the day after its fourth performance, on Dec. 14, to the surprise and indignation of the company of the Palais Royal, the tragedians of the Hôtel de Bourgogne, with the author's connivance, performed the play privately before the king and his brother, and on Dec. 18 staged it publicly as part of their repertory. Molière could hardly fail to regard the incident as an affront to his actors and a betrayal of his friendship. The fortunes of Racine were henceforth identified with those of the Hôtel de Bourgogne, whither, 15 months later, he enticed Mademoiselle du Parc, who thus for the second time abandoned the company of Molière.

THE ZENITH

Le Misanthrope.—*L'Amour Médecin* was followed on June 4, 1666, by *Le Misanthrope,* the greatest of the comedies of Molière. His theme is no longer the special vice of a particular class or profession, but the whole attitude of the just man to a society necessarily founded on compromise. The antithesis from which the dramatic conflict arises is between virtue and convenience. Alceste, who can make no concessions, inflexible on the point of honour, over-sensitive in all his dealings, is contrasted with Celimène, who loves the frivolous world, and with Philinte, who represents a wise conformity with average conduct and opinion. The play was too subtle for the audiences of the Palais Royal, and after nine performances the receipts began to fall. The reception of the play by the court, of which inferentially it is a bold indictment, is not very clear. *Le Misanthrope* is undoubtedly a play which posterity has learned to appreciate more justly than any of its contemporary critics or admirers. The part of Alceste was played by Molière and that of Celimène by his wife, and the comedy may justifiably be read as a reflection of their domestic relations. The whole play is at once intimate and detached. It is a personal confession, but the comic genius of the author, serenely regarding his private woes, transforms this confession into a sane, contemplative record that remains true for all mankind.

On Aug. 6, 1666, Molière, presumably losing money on *Le Misanthrope,* produced *Le Médecin Malgré Lui,* revising for the occasion an old farce previously described as *Le Fagotier* or *Le Médecin par Force.* It is another play in which the medical profession is maltreated, perhaps the best of the farces, boisterous in its energy and invention, but running with a lightness of fancy and a fitness of expression peculiar to its author. The remainder of the year was spent in preparing for the festival of the *Ballet des Muses* at St. Germain, which lasted from Dec. 1, 1666, to Feb. 20, 1667. Molière contributed three items to the festival: *Melicerte, La Pastorale Comique* and *Le Sicilien.*

The year which followed was one of difficulty and discouragement. In the early summer Molière was ill, and after the festival at St. Germain he did not return to the theatre until June. He was then on a milk diet. *Tartuffe,* as we have seen, was suspended in August, and Molière, who had threatened to retire if the Tartuffes were allowed to have it their own way, abandoned his rooms in Paris for the villa at Auteuil. His relations with his wife were now at their worst, and for the next four years they were to remain unreconciled. The friends of his leisure at Auteuil, in addition to the faithful Chapelle, were Boileau and La Fontaine.

The fit of discouragement passed and in Jan. 1668 he returned to the Palais Royal with the comedy of *Amphitryon,* a masterpiece in the Latin tradition which pleased equally the town and the court. Molière seems to have spent his leisure moments at Auteuil re-reading the classic authors, for *L'Avare,* produced on Sept. 9, was frankly derived from Plautus. Between these two productions in the classic mode, there intervened a summer festival at Versailles, for which Molière wrote *Georges Dandin,* a farce in which husbands of low degree who marry into the county may find their woes embalmed for ever. Of the three masterpieces of 1668, *L'Avare* was the least successful. Avarice of the classic kind was not a vice of the period, and the subject was too sternly handled for the audiences who were still applauding *Amphitryon.*

Royal Festivals.—In the autumn of 1669 Molière was on duty with the king at Chambord from Sept. 17 to Oct. 20, where, on Oct. 6, in collaboration with Lulli, who wrote the music, he produced *Monsieur de Pourceaugnac.* It was this play that gave rise to the observation of Voltaire that in all the farces of Molière there were also scenes of high comedy. The high comedy is disputable, but the high spirits are undoubted. The best of the scenes is one in which the doctors are again satirized. Molière, on a milk diet, is clearly indisposed to be reconciled to the medical profession. Four months later Molière was again called to St. Germain, where he remained at the king's disposal from Jan. 30 to Feb. 18. During this time he wrote and produced *Les Amants Magnifiques,* an allegorical ballet upon a theme suggested by the king. To cover the expenses of the festivals of Chambord and St. Germain the king granted the company an indemnity of 12,000 livres. In the autumn of 1670 Molière is again at Chambord, where on Oct. 14 the most justly famous of all the comedy-ballets, *Le Bourgeois Gentilhomme* was produced. So greatly did it please the court that four performances were requested in eight days. The *turqueries* of the play, which a sensitive orientalist may deplore, were introduced at the special request of the king. The comedy itself was pure Molière and subject to no inspiration but his own. Lulli contributed the music, and special attention was given to the costumes and staging. Molière paid dearly for the royal favour. Since the production in 1666 of *Le Misanthrope* most of his time and energy had been given to the royal festivals in which his genius was necessarily subordinated to the requirements of the court; and in 1671 he was set a further task in the performance of which it was difficult for him to enrich his immortality. The new spectacle, commanded for the Tuileries in January, was a *tragédie-ballet* on the theme of *Psyche.* Time was short and Molière looking for a collaborator secured the great Corneille. The collaboration was surprisingly successful. Molière sketched the plan of the ballet, but wrote only a small part of it. The spectacle itself was scenically so complicated that it was six months before it could be transferred from the Tuileries to the *Palais Royal.* In the meantime Molière entertained the town with *Les Fourberies de Scapin,* the revised version of a play which seems to have been originally produced in 1661 under the title of *Gorgibus dans le Sac.* This was a return to his earliest manner of farce, probably based on one of his provincial sketches, and it drew from Boileau a vehement protest against such a wasting of the genius of his friend. Boileau was urging Molière at this time to abandon the stage and devote himself to authorship, but Molière made it a point of honour to remain faithful to his vocation. To the end he was resolved "a dévouer son dos à toutes les bastonnades de la comédie." Boileau pleaded in vain.

In Dec. 1671 Molière was summoned to St. Germain to organize

yet another entertainment for the king. *La Comtesse d'Escarbargnas,* a hasty sketch which served the occasion, was a play which Molière did not himself desire to publish. For this festival he also improvised a ballet from previous entertainments of the kind and wrote a *Pastorale.* The *Comtesse d'Escarbargnas* was transferred to the Palais Royal in July 1672, where it was played along with a revival of *Le Mariage Forcé.* This was the last of the royal festivals to which Molière was to contribute. He was at St. Germain from Dec. 1671 to Feb. 1672.

On Feb. 17 occurred the death of Madeleine Béjart. In accordance with custom she solemnly renounced her profession and was accorded Christian burial with the permission of the archbishop of Paris. Exactly a year later Molière died, as he had lived, an actor. For him the archbishop would be less accommodating.

Last Plays and Death.—In the year that remained to him, Molière, free for the moment from his royal taskmaster, wrote the last two of his comedies. *Les Femmes Savantes* was produced at the Palais Royal on March 11, 1672, and *Le Malade Imaginaire* on Feb. 10, 1673. *Les Femmes Savantes* inevitably provokes comparison with *Les Précieuses Ridicules.* The earlier play for all its brilliance and verity is thin and superficial beside this product of an observation more penetrating and mature. The first was aimed at a polite affectation which socially was absurd and artistically mischievous. The second deals more seriously with the dangers of a little learning, and is of a more general application. The history of *Le Malade Imaginaire* is more than a theatrical event. It is the history of the death of Molière. For some time his health had caused his friends the greatest anxiety, and on Aug. 11 and 12 the theatre of the Palais Royal was closed owing to his indisposition. He had, as we have noted, left the house at Auteuil, and was now living again with Armande in the house in the Rue de Richelieu. Madeleine had died in February, and his second son, born on Sept. 15, 1672, died on Oct. 11. Meanwhile, sick unto death, he was writing his comedy of the man sick only in imagination, an act of courage and detachment rarely equalled in the history of genius. The play was produced at the Palais Royal on Feb. 10, and repeated on Feb. 12 and 14. On Friday, Feb. 17, Molière was feeling worse, and was urged by his wife and the young actor Baron not to go to the theatre. The reply attributed to him by Grimarest, who had it from Baron himself, is celebrated: "Comment voulez-vous que je fasse. Il y a cinquante pauvres ouvriers qui n'ont que leur journée pour vivre; que feront-ils si l'on ne joue pas. Je me reprocherais d'avoir négligé de leur donner du pain un seul jour, le pouvant faire absolument." Molière went to the theatre and acted with difficulty. In the course of the performance he was seized with a convulsion which he covered with a forced laugh. When the play was finished he complained of being cold, and Baron had him carried home. He ate a little bread and cheese and went to bed, where he was taken with a violent fit of coughing. He asked for his wife, but before she could arrive he died in the arms of two lay-sisters who had come to Paris during Lent to collect for charity and were at the time staying at his house.

Armande, in the appeal which she subsequently addressed to the king, says that, while dying, he sent urgently to the parish priests of St. Eustache, who refused to come to his assistance. He accordingly died without the sacraments or any formal renunciation of his profession, and the archbishop of Paris was thus canonically justified in refusing him Christian burial. His wife appealed to the king against this decision, and for the last time Louis XIV. intervened on behalf of his faithful servant. The royal intervention, however, as in the case of *Tartuffe,* resulted only in a compromise. The archbishop signed an order permitting ecclesiastical burial in the cemetery of St. Eustache, but the funeral was to be without ceremony, with two priests only and after sunset. The obscurity that covers the birthplace of Molière rests also upon his grave. It is even doubted whether, as the king wished, he was actually interred in consecrated ground or, by secret instructions of the archbishop, in a portion of the cemetery reserved for those who were denied this privilege. In spite of the most careful researches it has since proved impossible to identify the tomb or the bones of Molière.

ESTIMATE OF MOLIÈRE

The Man and His Work.—Of Molière it may be said with confidence that he was not only a great author but a great man. His life has a dramatic quality which makes it possible to think of it as perhaps the greatest of his plays. Apart from the many legends, to which only a passing reference and very little credit has been allowed in this article, the events and productions of his career speak for themselves. He not only represents the most vital and enduring qualities of his race, but his works are a protest against and a correction of the defects to which the French genius is peculiarly liable. His mind is without prejudice; he rejects nothing till it threatens to limit the free exercise of a sane intelligence, or to distort a reasonable conduct. He is thus the natural scourge of academies and sects, the enemy of all excess. The logic of his race pushed to extremes results in a rationalism and a formality which it was his peculiar mission to expose and to deride. His plays represent a survival of the old Gallic spirit, near to earth and the realities, into the classic period of French literature which was in danger of becoming too limited and remote from ordinary social experience. His comedies are a constant plea for sanity and the golden mean, and his life was spent in challenging bigotry, imposture, and exaggeration in every class and profession of society. The perfect balance of the mind and disposition of Molière is most clearly shown by the fact that he could take his own misfortunes and sorrows for a comic theme as sweetly and evenly as the vices or foibles of other men. There is never a trace of malignancy in his satire. It is always generous in inspiration and inexhaustibly vivacious. He found only one constant and effective supporter, without whom, for all his courage and pertinacity, he could never have ridden the storms which he raised. Louis XIV. considered himself sufficiently above the society of his time to view with equanimity its just correction. To Louis XIV. we must accord the merit of recognizing in Molière the greatest of his subjects, though we must at the same time deplore the unconscious insolence with which he imposed upon his favourite tasks which were so obviously beneath him.

The plays, as we have seen, fall roughly into three groups; first, the farces of intrigue, based on the conventional figures of the comic theatre which he inherited from the old classic or the contemporary Italian stage; secondly, the episodic and spectacular entertainments which he was called upon to organize for the court; thirdly, the social comedies in which he fully expressed his individual attitude to life and which he filled with the deathless characters of his own creation. There is no fixed boundary between the three types. In the most conventional of the farces there are passages to which the genius of Molière gives an individual turn, and in some of the *comédie-ballets,* notably *Le Bourgeois Gentilhomme,* we find some of his best characters and scenes. Towards the close of his career Molière contrived to meet the demands of the king for spectacle and at the same time to write the comedies he desired. *Le Malade Imaginaire,* for example, was a *comédie-ballet,* but it was also a supreme gesture of the comic spirit—the play in which the great comedian passed from a counterfeiting of death to death itself.

The Epicurean sanity of Molière, with its persistent correction of all extremes, has often exposed him to criticism more formidable than that of the sectaries. Men of a generous habit have felt its limitations, complaining that Molière seems often to be no more than a champion of prudence and the middle way and that there are whole tracts of human experience which lie beyond the scope of his art. But this is only to say that Molière is a comedian. He is not a mystical philosopher, or even a poet of passion. His subject is man in society. The answer to those who accuse him of an excessive worldliness and moderation is to be found in the fact that the critics of his own age charged him with anarchism, atheism and impiety. To the people of his own time he was a splendid or an infamous revolutionary according as they championed him with La Fontaine or censured him with Bossuet. The critics of the 19th century complained that he cared for no truth or principle sufficiently to be either a moral or a religious revolutionary, and it cannot be disputed that the morality of Molière is that of a man who wisely avoids adventurous extremes.

But on behalf of the moderation which for him was the secret of social wisdom, he fought a lifelong battle with a courage and persistence that have rarely been equalled. His lack of doctrine was due not to any moral indifference, but to his sense of the unlimited energy and possibilities of life. The human spirit was for him too various to be limited by any formula.

The style of Molière, in verse and prose, was a reflection of his free spirit and his candid intelligence. He wrote with extreme facility, but he was never a sloven. He is both voluble and precise. His prose dialogue is unequalled outside the plays of Shakespeare, and his verse has an ease and variety that make it immediately tolerable even to the foreign reader for whom the French alexandrine is a taste to be painfully acquired. The most exacting authors of the classical tradition, like Boileau, no less than their romantic successors, like Victor Hugo, unite in praising the style of Molière from opposite angles. Foreign readers, though their appreciation of French may be limited, rarely fail to appreciate the lucidity and vivacity of his writing.

For Molière's personal appearance we have the portraits of Mignard and the description of Mademoiselle Poisson, who saw him in the flesh: he was "neither too stout nor too thin, tall rather than short; he had a noble carriage, a good leg, walked slowly and had a very serious expression. His nose was thick, his mouth large with thick lips, his complexion brown, his eyebrows black and strongly marked, and it was his way of moving these that gave him his comic expression on the stage." He was of a grave and melancholy disposition—a contemplative genius, given to fits of abstraction. But he could speak well on occasion, and all his friends bear witness to the wit and charm of his conversation. In his private dealings he was generous, sympathetic and candid, tolerant for the faults he understood so well, delicate in his appreciation of the views and sentiments of others. He was free, gentle and fearless. Exposed to a criticism and calumny such as few men have had to sustain, we can find in him no trace of envy or malice and nothing mean was ever charged to his account.

Bibliography.—The standard edition of the works of Molière is that contained in the collection of the *Grands Ecrivains de la France*, edit. by Eugène Despois et Paul Mesnard (1873–1900). It contains the best biography of Molière (vol. ix.) and a bibliography which is complete up to 1893 (vol. xi.). The earliest life of Molière is the preface to the first edition of his works published in 1682 by La Grange and Vinot. This is included in the edition of Despois et Mesnard. Grimarest, who obtained most of his information from Baron, a young actor who was for many years in the company of Molière, published a life of the dramatist in 1705; he is, however, untrustworthy. The life of Molière by Voltaire throws more light upon its author than upon his subject, and the excellent biography of Taschereau (1863) requires careful correction in the light of recent research. The life prefixed by Ste. Beuve to the edition of 1825 is of more value as criticism than biography. Among later biographies are those of Jules Claretie (1873); J. J. Weiss (1900); Georges Lafenestre (1909); Maurice Donnay (1911). The contemporary sources may be studied in the documents collected by Edouard Soulié, *Récherches sur Molière et sa famille* (1863), and the *Collection Molièresque* of Paul Lacroix (1867–75). This last work contains the more important contemporary libels including *La Fameuse Comédienne, Elomire Hypocondre* and *Zélinde*. It was supplemented by a *Nouvelle Collection Molièresque*, begun by Paul Lacroix (1863–84) and continued by Georges Monval (1884–90), who also edited a monthly review, *Le Molièriste*, an important source of information (1879–89).

Among the authors who have dealt with the problems of the marriage and family relations of Molière are Jules Loiseleur in *Les Points obscurs de la vie de Molière* (1877) and Edouard Fournier in *Etudes sur la vie de Molière* and *Le Roman de Molière* (1885). The most searching and authoritative modern studies in the biography of Molière are Gustave Michaut's; he critically reviews all the previous evidence and gives the results in *La Jeunesse de Molière* (1922), *Les Débuts de Molière à Paris* (1923), and *Les Luttes de Molière* (1925).

Critical studies of Molière will be found in the works of Jules Lemaître, *Impressions de théâtre* (1888–90); P. Bourget, *Etudes et Portraits* (1889); Brunetière, *Epoques du Théâtre Français* (1892), and *Etudes Critiques sur l'histoire de la litérature Française* (1895–1908). (J. Pa.)

MOLINARI, BERNARDINO (1880–), Italian conductor, was born in Rome in 1880. He studied at the Liceo S. Cecilia and, in 1912, was appointed permanent conductor at the Augusteo, Rome. His work as a supporter of the new Italian composers is of great importance, and he ranks as one of the leading European conductors.

MOLINE, a city of Rock Island county, Illinois, U.S.A., on the Mississippi river, adjoining Rock Island and opposite Davenport, Ia., 167 m. W. by S. of Chicago. It is on Federal highways 32 and 61; is a station on the Chicago-Dallas air-mail route; and is served by the Burlington Route, the Chicago, Milwaukee, St. Paul and Pacific, the Davenport, Rock Island and North-western and the Rock Island railways, and by river barges and steamers and motor-bus and truck lines. Pop. 30,734 in 1920 (24% foreign-born white, largely from Sweden and Belgium); and was 32,236 Federal census 1930. It has large, diversified manufacturing industries. It is frequently called "the plough city," from its most distinctive product, and farm implements are still the leading group of manufactures. The 85 plants of Moline and East Moline (*q.v.*) have 15,500,000 sq.ft. of floor space, employ over 11,000 workers, and have an annual output of $77,000,000. The city's assessed valuation of property for 1928 was $24,773,885. Moline was settled in 1832, laid out in 1842, and chartered as a city in 1855. In 1847 John Deere, inventor of the steel plough, moved here to take advantage of the water transportation facilities, and established a small shop from which has developed the largest plough-manufacturing business in the world.

MOLINET, JEAN (1433–1507), French poet and chronicler, was born at Desvres (Pas de Calais). In 1475 he succeeded Georges Chastellain as historiographer of the house of Burgundy, and Margaret of Austria, governor of the Low Countries, made him her librarian. His continuation of Chastellain's chronicle, which covers the years from 1474 to 1504, remained unpublished until 1828 when it was edited (Paris, 5 vols.) by J. A. Buchon. It is far from possessing the historical value of his predecessor's work. A selection from his voluminous poetical works was published at Paris in 1531, *Les Faictz et Dictz de feu . . . Jehan Molinet. . . .* He also translated the *Roman de la rose* into prose (pr. Lyons, 1503). He became, in 1501, canon of the church of Notre-Dame at Valenciennes, where he died on Aug. 23, 1507. He was head of the *rhétoriqueurs*, a Burgundian school of poetry.

See A. Wauters in *Biographie nationale de Belgique* (vol. xv., 1899).

MOLINO DEL REY, or King's Mill, a group of thick stone buildings about two miles southwest of the city of Mexico. There on September 8, 1847 was fought probably the bloodiest battle of the War between Mexico and the United States (1846–1848). Major General Winfield Scott, in command of some 8,000 United States troops, was opposed to some 19,000 troops under General Santa Anna. The battle lasted all day; both Molino del Rey and Casa Mata fell into American hands in the evening. The losses on the part of the Mexicans were over 3,000, whereas the United States troops had over 700 killed and wounded.

MOLINOS, MIGUEL DE (*c.* 1640–1697), Spanish divine, the chief apostle of the religious revival known as Quietism, was born on Dec. 25, 1640 at Patacina, near Saragossa. He entered the priesthood and settled in Rome about 1670. In 1675 Molinos had published a volume, *Guida spirituale, che disinvolge l'anima e la conduce per l'interior camino all' acquisito della perfetta contemplazione e del ricco tesoro della pace interiore.* This was shortly followed by a brief *Trattato della cotidiana communione.* No breath of suspicion arose against Molinos until 1681, when the Jesuit preacher, Segneri, attacked his views, though without mentioning his name, in his *Concordia tra la fatica e la quiete nell' orazione.* The matter was referred to the Inquisition. It pronounced that the *Guida spirituale* was perfectly orthodox, and censured the intemperate zeal of Segneri. But the Jesuits set Father La Chaise to work on his royal penitent, Louis XIV., who was on very bad terms with Innocent XI.

Following on official representations by the French ambassador in Rome, who happened to be a cardinal, Molinos was arrested in May 1685. At first his friends were confident of an acquittal, but in the beginning of 1687 a number of his penitents of both sexes were examined by the Inquisition, and several were arrested. A report got abroad that Molinos had been convicted of moral enormities, as well as of heretical doctrines; and it was seen that he was doomed. On Sept. 3, 1687 he made public profession of his errors, and was sentenced to imprisonment for life. In the following November, Innocent signed a bull condemning sixty-

eight propositions from his *Guida spirituale* and unpublished writings. Molinos died in prison at Rome on Dec. 28, 1697.

In fact the doctrine of Molinos went farther than the Reformers had done. The Reformation maintained that the Church, so far from being a help, was a hindrance, to union with Jesus; whereas Molinos welcomed both Church and Jesus as helps to union with God, always provided that the believer treated both as means to an end beyond themselves. In other words, he held that there was a triple stage in piety. Beginners gave themselves wholly to the Church. At the second step came devotion to Jesus. At the highest stage both Church and Jesus were left behind as *deiformes, sed non Deus,* and God remained alone.

But how could a finite being bring himself into direct relation with Infinity? The less sense of proprietorship we have in a thought or action—the less it is the fruit of our deliberate will—the more certain may we be that it is divinely inspired. But what state of mind is most likely to be visited by these spontaneous illuminations? Plainly the state that Molinos calls the "soft and savoury sleep of nothingness," where the soul is content to fold its hands, and wait in dreamy musing till the message comes. For this reason disinterested love became the great hallmark of Quietist sanctity. Although Molinos's system did not long survive him, few writers have struggled so long and so hard to disengage the essence of religion from its transitionary embodiment in an historical creed.

The *Guida spirituale* was published in Italian in 1675, and has been reprinted. An English translation appeared in 1688; it has been re-edited by Mrs. Arthur Lyttelton. French, Spanish and Latin translations have also appeared. For the history of its author *see* C. E. Scharling, *Michael de Molinos* (Ger. trans. from Danish; Gotha, 1855); H. Heppe, *Geschichte der quietistischen Mystik* (Berlin, 1875); and Dudon, *Le Quiétiste espagnol Miguel de Molinos* (1921). On the whole subject of Quietism *see* H. Delacroix, *Études d'histoire et de psychologie du mysticisme* (Paris, 1908). There is a brilliant, but very fanciful, account of Molinos and his doctrines in J. H. Shorthouse's romance, *John Inglesant.*

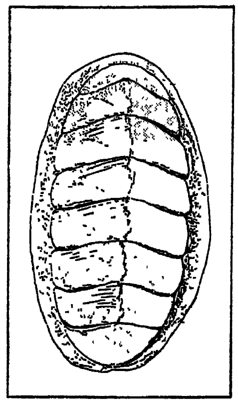
MOLKO (1500–1532), a Marano kabbalist, who proclaimed the advent of the Messiah. He was associated with David Reubeni, who also made Messianic claims. Molko, after a chequered career, was condemned to death by the ecclesiastical court at Mantua. He was offered his life by the emperor Charles V. if he would return to Christianity, but refused, and died at the stake.

MÖLLENDORF, WICHARD JOACHIM HEINRICH VON (1724–1816), Prussian field marshal, was born at Lindenberg on Jan. 7, 1724, and began his career as a page of Frederick the Great in 1740. In the Seven Years' War his brilliant conduct at the churchyard of Leuthen (1757) and at Hochkirch won him his majority. In 1760 his exertions retrieved the almost lost battle of Torgau, and the last success of the great king was won by the brigades of Prince Wied and Möllendorf (now major-general) at the Burkersdorf heights. Seventeen years later, as lieutenant-general, he won at Brix one of the few successes of the Bavarian Succession (or "Potato") War. Promoted general of infantry in 1787, and general field marshal in 1793, he commanded the Prussian army on the Rhine in 1794. He died in retirement at Havelberg on Jan. 28, 1816. Möllendorf was one of the first to protest against the maltreatment of soldiers by their officers.

MOLLIEN, NICOLAS FRANÇOIS, COUNT (1758–1850), French financier, was born in Paris on Feb. 28, 1758. He entered the ministry of finance as a young man, and put his great financial ability at the service of successive Governments. Under Colbert he improved the returns from the farmers-general of the taxes; he helped the conclusion of the Anglo-French treaty of 1786; after the coup d'état of Brumaire (Nov. 1799) he held successive financial appointments, and was constantly consulted by Napoleon, who, however, refused to accept the advice of his finance minister against his "continental system." He was again finance minister during the Hundred Days, and, though he declined office after the Restoration, was consulted in connection with the annual budgets.

See Mollien's *Mémoires d'un ministre du trésor public 1780–1815,* 4 vols. (1845; new ed., 3 vols., 1898); A. G. P. Barante, *Études historiques et biographiques* (1858); N. A. de Salvandy, *Mollien* (1851); also M. M. C. Gaudin (duc de Gaëte), *Notice historique sur les finances de la France 1800–1814* (1818).

MOLLUSCA. A large group of invertebrate animals constituting a large subdivision or phylum of the animal kingdom and comprising such forms as land and aquatic snails and slugs, oysters, mussels, cuttlefish and squids. The group is very large, containing over 60,000 living species, and, judged by its distribution, it has been highly successful, as its members have populated the sea, fresh water and the land. They manifest great diversity of habit and structure, and range in size from the giant squids of the Atlantic, which span over 50ft. in length, to snails less than a millimetre in length in the adult state.



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

FIG. 1.—CHITON NOBILIS

The phylum is divisible into five classes: the Amphineura (chitons or coat of mail shells), the Gastropoda (limpets, whelks, snails and slugs), the Scaphopoda (or tusk shells), the Lamellibranchia (oysters, mussels and scallops), and the Cephalopoda (squids, cuttlefish and octopods). Certain problematical fossil forms, the Conularida, are sometimes treated as a class of the Mollusca. Their exact zoological position is, however, debatable, and they cannot be adequately discussed here (*see* GASTROPODA).

The Gastropoda are the largest class of molluscs, and easily outnumber the rest. The Scaphopoda are a small group of but two families. In the past such animals as Tunicates, Brachiopods and Cirrhipedes were included in this phylum, and a well defined concept of the latter was only formulated towards the end of last century. Thiele and Odhner at the present time hold the view that the Solenogastres or Aplacophora, a subdivision of the Amphineura, are more closely related in certain respects to certain groups of worms than to the Mollusca. This view is not accepted here and the Solenogastres are treated as molluscs (*see* AMPHINEURA).

Definition and Classification.—The Mollusca are invertebrate animals, typically elongate in form and having an originally symmetrical organization. The viscera are sheathed in an outer integument, of which the lower part is modified as a muscular organ of locomotion, the foot, and the upper part (the mantle) is extended on each side and hangs down as a free fold around the body, enclosing a space, the mantle-cavity. The mantle secretes a calcareous shell and its under surface within the mantle-cavity gives rise to the organs of respiration (gills or "false" gills), or is modified in terrestrial, air-breathing molluscs to form a lung. In all Mollusca except the Lamellibranchia the anterior tegumentary region is modified as a more or less mobile head usually provided with sensory appendages and sense-organs. This threefold division of the body constitutes the essential plan of molluscan organization. In addition, it should be noted as especially characteristic of the phylum that (1) there are very scanty traces of segmentation; (2) the coelom is represented by the pericardium and gonad but is much reduced by the extensive vascular system; (3) the alimentary system (except in the Lamellibranchia) is characterized by the peculiar tongue beset with chitinous teeth (radula); (4) the nervous system consists essentially of a circumoesophageal ring composed of an upper or cerebral half and a lower or labial portion, from the point of junction of which arise longitudinal pallial and pedal cords on each side, and (5) the cleavage of the egg is spiral and segmentation usually gives rise to trochophore and veliger larval stages.

FIG. 2.—ROMAN SNAIL

The Amphineura are exclusively marine, of elongate shape and symmetrical organization, having the mantle beset with spicules. In the most familiar forms (*Chiton*) the shell is divided into eight separate plates. The Gastropoda are asymmetrical and characterized by the atrophy or disappearance of the organs of the original

SEA-SHELLS FROM TROPICAL WATERS

1. *Cypraea arabica.* Named from hieroglyphic-like markings on back. Found in Eastern seas. 2. *Conus princeps,* var. *regius;* length 1.5 to 2.25 inches. W. coast C. America. 3. The episcopal mitre (*Mitra episcopalis*). Ceylon and Philippines. 4. *Strombus gracilior;* carrion feeders. They are very active and progress by a sort of leaping movement. Their eyes are better than those of many [illegible] *ringens*); with outer edge of lip turned back, giving the effect of a grin. Peru and Panama. 6. *Phyllonatus nigritus;* length 3 inches; carnivorous. Pacific Coast. 7. *Melongena patula.* West coast of Mexico and Central America. 8. Red helmet or bull's mouth (*Cassis rufa*); length 5 to 7 inches; red, orange and chocolate markings. Found on shores of Japan

left-hand side, and by the spiral winding of the shell and visceral mass. The Scaphopoda are marine; the mantle is fused in the mid-ventral line, so as to enclose the visceral mass in a sheath which secretes a tubular shell. The Lamellibranchia are aquatic: the mantle is divided into right and left lobes which secrete a bivalve shell: the head is undeveloped and the gills become highly complex, subserving nutrition as well as respiration. The Cephalopoda are marine molluscs in which the head and foot are fused. The edges of this mass are produced into appendages; the ventral surface is much abbreviated and locomotion is mainly accomplished by the ejection of jets of water through an organ (the funnel) developed from the foot.

MORPHOLOGY

The structure and modification of the various organ systems are described in detail under each class but there are certain anatomical and physiological features which may be considered here.

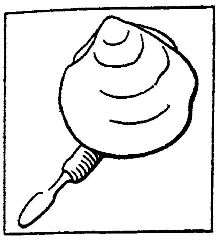

FIG. 3.—CRYPTODON

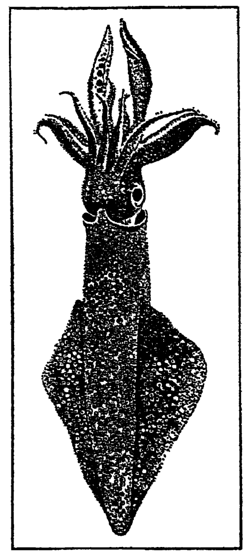
External Features.—The main divisions of the body (head, visceral mass, mantle and foot) are usually quite manifest. In the Scaphopoda and Amphineura, however, the head is moderately developed, and in the Lamellibranchia it is absent. In the Gastropoda it is usually very mobile and well-equipped with sense-organs. In the Cephalopoda it is fused with the foot; the appendages formed from the edge of the latter are arranged in a circlet round the mouth, and the transference of prey to the latter and a firm grasp on it, while it is being masticated by the jaws, are thus facilitated. The central nervous system (*see* below) tends to become concentrated in the head in Gastropoda and Cephalopoda. The occurrence in certain Gastropoda of a sheath of hard connective tissue around the ganglia and of cephalic cartilages enclosing the latter in the Cephalopoda produces an amount of "cephalization" uncommon in invertebrate animals. In the Lamellibranchia the mantle attains considerable importance. From it are developed the siphons by which the animal maintains connection with the water when burrowing in sand or mud. Its derivatives, the gills, are important not only in respiration but also in nutrition and in the incubation of the young. In the Cephalopoda it is of great functional importance in locomotion and (as a mechanical factor) in respiration and excretion.

The shell is secreted by the mantle in all molluscs. It consists in most cases of an organic matrix of conchyolin (a substance allied to chitin), impregnated with mineral salts. The latter consist mainly of calcium carbonate, but small quantities of calcium phosphate and magnesium carbonate are also found. The shell is formed in two layers—an external one of prisms of calcite and an inner of arragonite. The latter forms the nacre or mother-of-pearl seen in many shells. The shell grows in area by the addition of organic and inorganic matter secreted by the edge of the mantle and in thickness by addition of new matter to the inner layer secreted by the whole surface of the mantle. In addition to these two layers there is usually an external horny shell-epidermis or periostracum and a fourth more localized layer, the hypostracum, on the areas in which are inserted the muscles by which the shell is attached to the animal.

Internal Anatomy.—The alimentary system is divisible into three main regions—an anterior section comprising the mouth, pharyngeal mass and oesophagus, the mid-gut composed of the stomach and liver, and the intestine. In the Lamellibranchia the first of these is imperfectly developed. These animals feed on small particles and minute planktonic organisms and the mandibles, radula, pharyngeal musculature found in molluscs, which live on coarser food, are absent. In all molluscs the liver is the most important digestive organ and it may have absorptive and excretory functions. In the Gastropoda, Lamellibranchia and Scaphopoda there is an additional organ of digestion, the crystalline style. This is a rod of gelatinous substance containing digestive enzymes. It either lies free in the initial part of the intestine or is lodged in a special coecum developed therefrom. The Gastropoda and Lamellibranchia exhibit remarkable parallel modifications of this coecum. In the Cephalopoda there is a spiral coecum opening into the stomach which may be homologous with the style-sac; but, as in certain Gastropoda this and a spiral coecum coexist, the coecum of the Cephalopoda possibly represents the gastropod spiral coecum.

Circulation and Respiration.—The blood of most molluscs is colourless but haemoglobin and haemocyanin occur in certain forms. The blood is largely contained in a vascular system, but the latter rarely ends in capillaries and usually opens into capacious spaces (lacunae). These ramify among the various organs and their extensive development (*phleboedesis*) restricts the area of the primary body-cavity (coelom). The heart usually consists of a ventricle and two auricles. The blood is oxygenated in the surface-tissues of the mantle either in the respiratory organs (gills) or in the inner surface of the mantle-cavity ("lung" of air-breathing Gastropoda) or in the exposed surface of the mantle (certain Gastropoda, Scaphopoda). The gills are either true *ctenidia* (feather-like structures consisting of a hollow vascular axis supporting lateral filaments) or accessory branchial structures of various kinds. The surface of the ctenidia is covered with cilia in all molluscs but the Cephalopoda. By these cilia the water in the mantle cavity is kept in circulation. In the Lamellibranchia the food particles are sorted out by currents produced by the cilia and conveyed to the mouth. In the Cephalopoda the water in the mouth cavity is kept in circulation by the contraction and expansion of the mantle.



FROM MEYER, "TINTENFISCHE"

FIG. 4.—LOLIGO (CUTTLEFISH)

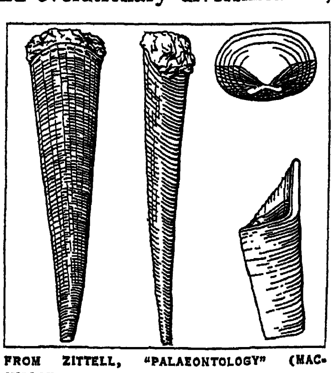
Coelom, Renal and Reproductive Organs.—The coelom is represented in most Mollusca by the pericardium and (when persistent) the cavity of the gonad. In the Cephalopoda there is a capacious gonadial portion of the coelom from the wall of which the ovary and testis are developed. In this class and certain Amphineura (the Aplacophora) the pericardium and gonadial coelom communicate with each other, but in all other molluscs the two portions of the coelom are separate. It is however to be inferred that the primitive connection between pericardium and gonad occurred in the ancestors of such molluscs, as in the more primitive members of the Gastropoda and Lamellibranchia the gonad opens into the duct connecting the kidney and the pericardium. It is not certain if the renal and generative ducts in all the groups of Mollusca are always true coelomoducts (*i.e.*, evaginations of the coelomic cavity). The kidneys open internally into the pericardium in all the classes except in *Nautilus* and the Scaphopoda. Whether this connection actually indicates that the kidneys are in all cases coelomic outgrowths is not certain. True nephridia only occur in larval Gastropoda and Lamellibranchia. In certain members of these two classes which have been carefully studied the adult kidneys are certainly mesodermal in origin and may be regarded as coelomoducts. In the Aplacophora, the archaic Gastropoda and the Scaphopoda there are no separate genital ducts, the ova and spermatozoa being discharged through the kidneys. This is likewise found in certain Lamellibranchia, but the genital conduit is gradually shifted towards the external end of the kidney and eventually acquires a separate opening. In the Neritacea among the Aspidobranchiate Gastropoda and the rest of that class in such forms as have been specially studied there is a separate genital duct formed from the originally left-hand kidney. In the Cephalopoda and Polyplacophora the gonaducts and kidneys are entirely separate.

The Nervous System.—The nervous system consists of ganglionic centres, nerve cords and sense-organs. The term "central nervous system" is not usually employed in connection with the nervous organization of the Mollusca; but there is in fact a

central group of ganglia connected by commissures and a peripheral system of nerves, localized ganglia and end-organs. The general plan of the system has been already indicated. The chief areas of the body and organs are innervated as follows. The head and its sense-organs are supplied with nerves from cerebral ganglia situated on the dorsal side of the circumoesophageal ring. The mantle and foot are innervated from pallial and pedal ganglia respectively from which the main pallial and pedal cords originate. The viscera receive their nerve supply from the labial commissure (the ventral part of the circumoesophageal ring) through a stomato-gastric system and also from a visceral commissure beset with ganglia which arises from the pallial ganglia. In primitive Mollusca the various ganglia are diffuse and the commissures joining them are long. In Gastropoda and Cephalopoda there is a marked tendency for the ganglia to be concentrated around the oesophagus and fused in a solid ring. The term "central nervous system" then becomes highly suitable. Whether this concentration has any functional significance is uncertain. It may be responsible for the highly co-ordinated movements performed by the Cephalopoda, but as far as nervous efficiency is concerned there does not seem much difference between those Gastropoda in which the ganglia are concentrated and those in which they are diffuse.

Reproduction.—The sexes are separate in most Mollusca and hermaphroditism is usually found in specialized forms. Sexual dimorphism is not marked. Copulation only occurs in the Cephalopoda and in certain Gastropoda in which a penis is found, but in some Lamellibranchia in which there is no copulatory organ fertilization is nevertheless internal. The eggs are laid separately in the Amphineura, Lamellibranchia, Scaphopoda and more archaic Gastropoda; in most aquatic Gastropoda and in the Cephalopoda they are deposited in masses which through the development of special capsules and supporting structures may become very complex. In a few Gastropoda, Lamellibranchia and Amphineura the eggs are incubated in the maternal body; but truly viviparous forms are rare. Parthenogenesis has been recorded in a single species of Gastropoda, *Paludestrina jenkinsi*. The development of the fertilized egg is described in detail under the separate classes (Gastropoda, etc., *qq.v.*).

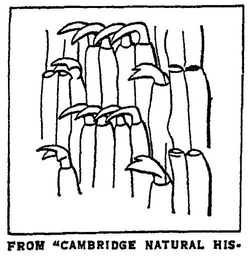
Bionomics.—The most primitive living molluscs are aquatic and the earliest fossil representatives (Lower Cambrian Gastropoda and Lamellibranchia) seem to have lived in the sea. The greater part of the modern Mollusca have retained this character. During the Devonian period they began to populate fresh water and in the Carboniferous they invaded the land. From that time onwards the population of freshwater and land has continued, that of land with increasing rapidity and evolutionary diversification, that of fresh water more slowly and with less variety of form and habit. The relative numbers of marine, fresh water and terrestrial forms may be gauged by the following list which gives the number of species in the British molluscan fauna as far as they can be thus classified. Marine 714, Fresh water 69, Land 91.



FROM ZITTELL, "PALAEONTOLOGY" (MACMILLAN)

FIG. 5.—HYLOTHES MAXIMUS

The Amphineura, Scaphopoda and Cephalopoda are exclusively marine in distribution and do not tolerate any reduction of the normal salinity of sea water. The freshwater fauna is made up principally of two groups—certain Tenioglossa (*Vivipara, Hydrobia, Melania, Ampullaria*) and Basommatophora (*Limnea* and *Planorbis*) among the Gastropoda and the Unionidae, Cyrenidae, etc., among the Lamellibranchia. The large terrestrial fauna is mainly drawn from a single suborder (the Stylommatophora) and a few families (*e.g.*, Helicinidae, Cyclophoridae, Auriculidae, etc.) of other Gastropoda. In other words, the population of fresh water is the achievement of a restricted group of Gastropoda and Lamellibranchia and the highly successful invasion of land has been carried out by the Gastropoda alone. As far as the Lamellibranchia are concerned the failure to populate land is readily explained, as their mode of nutrition has become highly specialized and entirely depends on water-borne particles and organisms. The absence of Cephalopoda from land and fresh water is not so easily explained. The Dibranchia are specialized for rapid swimming, so that the reason for their restriction to water is obvious. The littoral Octopoda, which live mainly on or just off the sea-bottom, can move over the latter with considerable agility so that locomotor specialization cannot be invoked to account for their absence from the land. In all likelihood the marked participation of the mantle in the locomotor function and its development as a muscular pumping organ in relation to respiration has deprived it of that capacity for being converted into an organ for breathing air characteristic of terrestrial Gastropoda. As for their failure to colonize fresh water there is no satisfactory explanation beyond the obvious suggestion that they may be physiologically intolerant of fresh and brackish water.

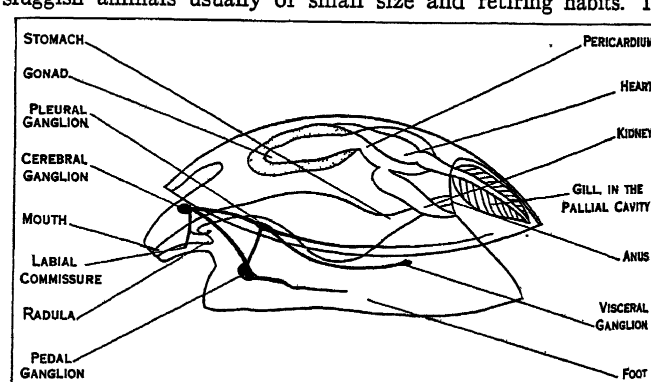


FROM "CAMBRIDGE NATURAL HISTORY" (MACMILLAN)

FIG. 6.—RADULA OF LIMPET

The marine Mollusca have a world-wide distribution as sedentary, swimming and floating animals and they are found at considerable depths in the sea, a few being found at a depth of over 2,900 fathoms. Certain groups are specialized for living permanently at great depths, *e.g.*, the Cirroteuthidae among the Dibranchiate Cephalopoda and the Septibranchia among the Lamellibranchia. The Pteropods, Heteropods and a few other Gastropoda, and the smaller branchiiform Cephalopoda are adapted in adult life as plankton organisms. By far the greater part of marine molluscs are sedentary and live on the bottom in relatively shallow water. Land and fresh water molluscs are likewise of almost universal distribution. The terrestrial forms are usually limited in their range by the requirement of a measure of humidity, shelter from excessive heat and light and of a certain amount of lime in the soil.

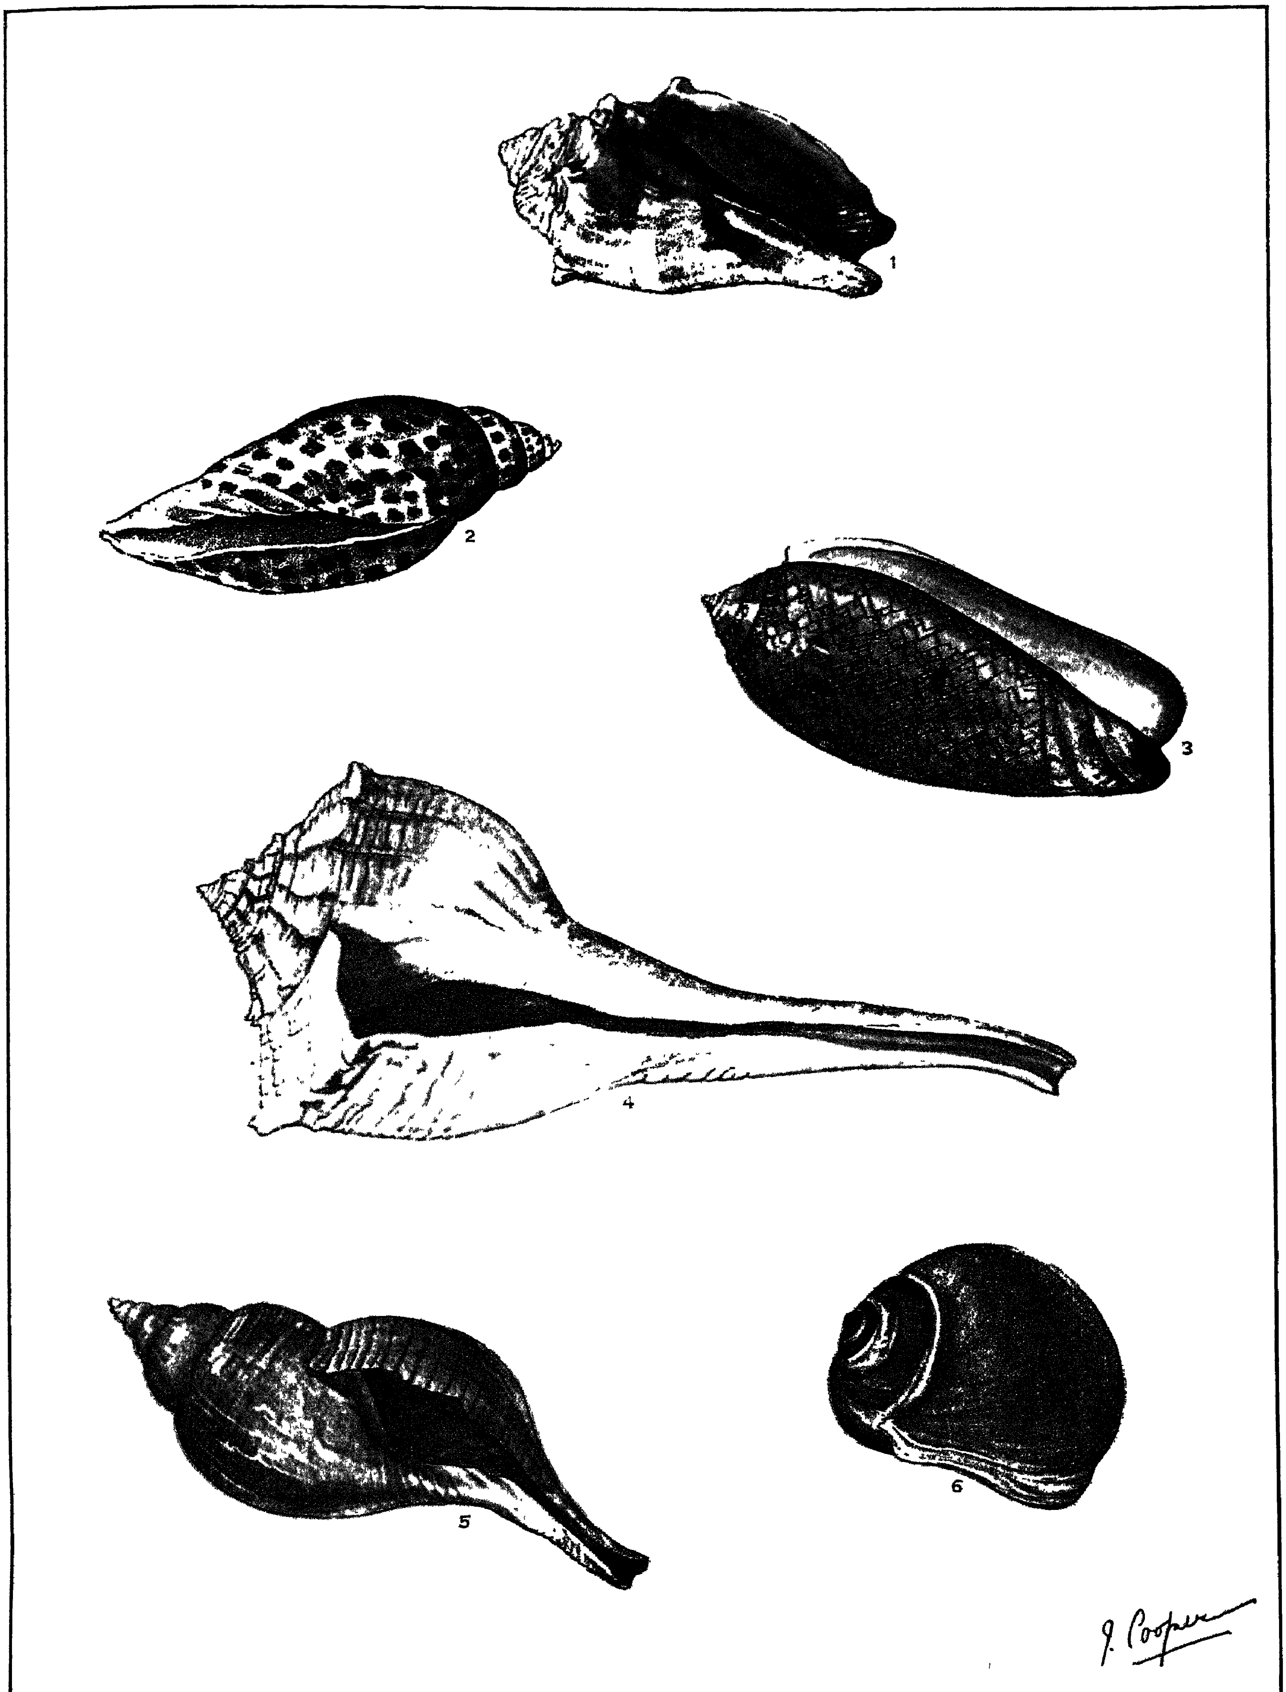
From the bionomic point of view the Cephalopoda stand apart from the rest of the Mollusca. Nearly all the living forms are highly mobile and vigorous animals, sometimes of large size and predatory habits. In these respects they are unique among invertebrate animals and afford the closest parallel to the vertebrates in organization and activity. The rest of the phylum are principally sluggish animals usually of small size and retiring habits. The greater number are vegetarian in diet. Certain Gastropoda are, however, carnivorous and, though their prey consists of either sessile animals such as Hydroids and sponges or slow-moving animals such as other molluscs, they are more vigorous and aggressive. The majority are, however, encumbered by their shell, and rely on passive defence rather than attack or flight in dealing with their enemies.



FROM LANKESTER, "TREATISE ON ZOOLOGY" (A. & C. BLACK)

FIG. 7.—SCHEME OF A PRIMITIVE MOLLUSC

The Scaphopoda and Lamellibranchia live a specialized life buried in sand or mud. To this sort of life the lamellibranchs are particularly well adapted. They can live for a long time buried

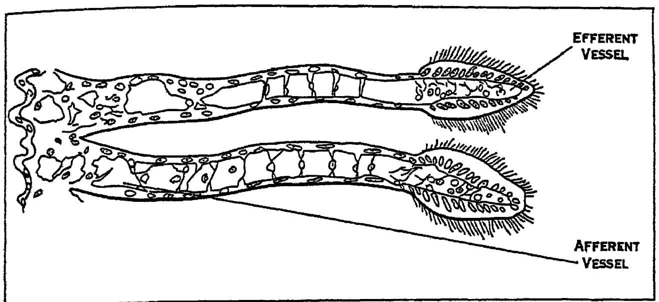


PAINTED FOR THE ENCYCLOPÆDIA BRITANNICA BY ISABEL COOPER AFTER SPECIMENS IN THE AMERICAN MUSEUM OF NATURAL HISTORY

SEA-SHELLS OF THE ATLANTIC SEABOARD

1. Fighting conch shell (*Strombus pugilis*); length 3.7 inches. About 65 species. Found from Cape Hatteras to Panama. 2. Peacock tail volute (*Voluta junonia*). Once sold for $200 each—now worth from $1 to $30 apiece. Island of Sanibel, a reef of Florida. 3. The porphyry olive (*Oliva porphyria*); length 4 inches. Markings have appearance of vast encampment of tents. Gulf of Mexico. 4. Left handed whelk (*Fulgur perversa*). Its original brown streaks fade and whiten with age. Gulf of Mexico. 5. Tulip band shell (*Fasciolaria tulipa*). Colour and design may vary greatly. Length 4 to 8 inches. South Atlantic. 6. Moon shell (*Natica duplicata*); round and smooth. Noted for the long foot it unfolds. New England to Gulf of Mexico

below the surface; but, as is pointed out in the article on this group (*q.v.*), this mode of life is not necessarily a sluggish and inactive one. Not only is a considerable amount of energy required to burrow in a semi-solid medium, but also those Lamellibranchia which live on open beaches must be always under the necessity of regulating their position during rough weather when the surface layers of sand are in continual motion. The Amphineura are



FROM ROBSON, "ANNALS AND MAGAZINE OF NATURAL HISTORY" (TAYLOR & FRANCIS)

FIG. 8.—GILL FILAMENTS OF HYPSOBIA NOSOPHORA

mostly sluggish, semi-adherent forms. The Gastropoda are more varied in their habits and include active carnivorous families, adherent and floating forms. Others are climbers, burrowers and swimmers. Both the Gastropoda and Lamellibranchia include commensal and parasitic forms as well as genera which bore into solid substances (rock, coral, etc.).

The Mollusca are on the whole short-lived. Most pulmonate Gastropoda are biannual, though some large Helicidae live as long as seven years. The marine Streptoneura live for several years but the Nudibranchs and Tectibranchs seem to be "annuals." The Cephalopoda, as far as is known at present, seem to have an average life of four to five years. Certain Lamellibranchia are known to live as long as 20 years.

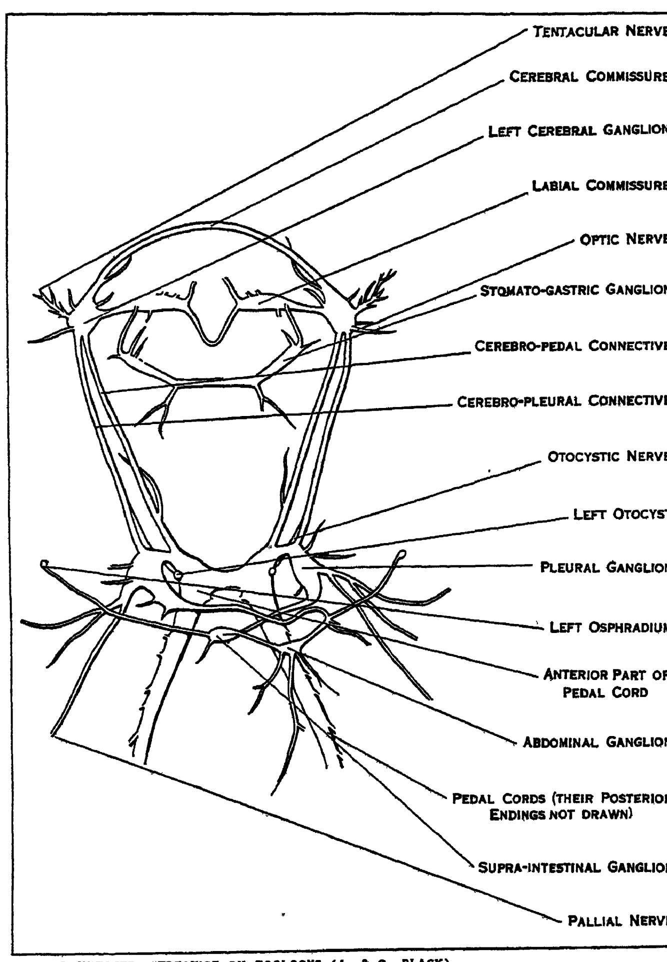
Interrelationships of the Various Classes.—Although it has been urged that the Solenogastres are not molluscs and should be placed in a different phylum and although Von Ihering has tried to prove that the Mollusca as at present constituted are not a homogeneous group, there seem to be no adequate grounds for doubting Pelseneer's dictum (1906) that the internal organization of the members of the phylum is remarkably uniform. In spite of very marked plasticity in external parts, the fundamental structural plan as sketched above remains singularly constant and unaltered. It is also significant that the larger classes all tend to show similar types of modification. To cite a single instance, the shell in all Mollusca save the Scaphopoda exhibits a constantly recurring tendency to become covered by the mantle and atrophied.

Nevertheless the relationship between the various classes is by no means clear. They each represent distinct evolutionary tendencies and it is by no means certain how far we can state that certain classes are more closely related than others. Grobben, for example, united the Gastropoda, Scaphopoda and Lamellibranchia into a grade, the Prorhipidoglossomorpha, distinct from the Amphineura and Cephalopoda. This association is up to a certain point justifiable. But it fails to express (a) the peculiar position of the Lamellibranchia which must have diverged along their distinctive evolutionary path at an early date in the history of the phylum and (b) the considerable resemblances between the Gastropoda and Cephalopoda. It is a useful working hypothesis to assume that there are three distinct elements in the phylum: (1) the Amphineura representing the most primitive age of development, (2) the Cephalopoda and (3) the Gastropoda, Lamellibranchia and Scaphopoda. It is true that the Amphineura (particularly the Chitons) have a simpler organization than the other Mollusca and may be considered to be the most primitive members of the phylum, though it is peculiar that they are not found as fossils until the Silurian (Ordovician?), whereas the other chief classes are recognizable in the Cambrian. Nevertheless it is not easy to employ the total complex of characters which each class represents, as an index of relationship or to decide with confidence which of those characters are actually primitive or how far resemblances have been brought about by convergence. For that reason it seems desirable to stress the individual and peculiar destiny of each class rather than insist on any grouping of the classes.

Relationships with Other Phyla.—A great deal of discussion has been devoted to the origin of the Mollusca. There are, however, two main and radically opposed views on this subject. The one emphasizes the resemblance between the trochophore larva of the Mollusca and the similar larva of the Annelida, and holds that the Mollusca are descended from the same ancestral form as the Annelida. The other theory (propounded by Lang and Thiele) stresses certain structural features of the adult as well as embryological data, and its authors would derive the Mollusca from the free-living Platyhelmia (Turbellaria). It is sufficient to say here that at present this question is unsettled, though the majority of zoologists would probably incline to the view that the Mollusca are more closely related to the Annelida than to any other phylum.

Historical.—The first systematic study of the Mollusca is due to Aristotle, who described various kinds of Cephalopoda, Gastropoda, etc., in his *Historia Animalium* and *de Partibus Animalium* and noted their habits with considerable accuracy. He made, however, a radical distinction between the naked forms and shelled forms which is no longer recognized.

The foundation of the modern study of the group may be attributed to Martin Lister, who in his *Historiae conchyliorum*



FROM LANKESTER, "TREATISE ON ZOOLOGY" (A. & C. BLACK)

FIG. 9.—NERVOUS SYSTEM OF PATELLA VULGATA

(1685) gave anatomical and conchological descriptions of many Gastropoda and Lamellibranchia; but the group was for a long time imperfectly understood and the "testaceous" Mollusca were still kept separate by Linnaeus from the "naked" form and associated with different groups of invertebrates. Linnaeus's "Mollusca" (1758) were a heterogeneous assemblage and did not include the shell-bearing forms. The work of Cuvier (1799), however, who assigned to the Mollusca a position as one of the chief primary groups of the animal kingdom, did much to clarify con-

temporary knowledge of this group. Among the naturalists of that period Poli and delle Chiaje made important investigations into the anatomy of various molluscs. It should be pointed out that the study of the Mollusca has always been characterized by an inevitable duality of method. On the one hand, conchological studies upon the form and the sculpture of the shell have contributed to our knowledge of the specific and generic variety of the group as well as of the geographical distribution of its members. Of such studies may be mentioned the earlier treatises of Martini and Chemnitz, Reeve and Sowerby and the later studies of Adams, Gwynn Jeffreys, Alder and Hancock, Von Martens, E. A. Smith and H. Fischer. On the other hand, the recognition of the limits and character of the group and the elimination from it of members of other phyla are due to anatomical and embryological research of which the most distinguished exponents have been Vaughan Thompson, Kowalevski, Milne Edwards, Lacaze Duthiers, Kölliker, Spengel, Owen, Huxley, Lankester and Pelseneer. (G. C. R.)

MOLLUSCOIDA: *see* Brachiopoda.

MOLLWITZ. In 1741 Frederick the Great was besieging the Silesian towns of Brieg and Neisse when an Austrian army under Neipperg advanced to their relief. (*See* Austrian Succession, War of the.) In snowy weather each army was for some time in ignorance of the other's whereabouts, but Frederick eventually located the Austrians in the village of Mollwitz. He got to within 2 m. of them before they were alarmed; then solemnly formed his army in the usual two lines, with cavalry on the flanks, and advanced in parade order with bands playing. Neipperg sent his cavalry under Römer to delay the Prussians while he drew up his own army, his right on the boggy Langwitz stream, his left on Grüningen. He had 20,000 men, including 8,600 excellent cavalry, but only 18 guns. Frederick's army was similarly formed and of equal strength, but he had only 4,000 indifferent cavalry; he had, however, 60 guns. His cavalry on the right, under Schülenburg, had crowded into the infantry, which had to throw back three battalions *en potence,* a formation which later proved valuable. At 2 p.m. on April 10, 1741, the Prussian guns opened fire on the Austrian army, which was still forming up. The fire was severe and Römer decided that the best way to avoid it was to attack. He launched 30 squadrons against Schülenburg's ten and swept them headlong from the field. Frederick was involved in their rout and was persuaded by his lieutenant, Schwerin, to save himself in flight. The Austrian cavalry now turned upon the Prussian foot but found themselves faced by a very different proposition. Twenty years of drill had given Frederick's infantry a steadiness and fire control that no cavalry could shake. Five times Römer hurled his gallant squadrons against their ranks, on one occasion attacking the second line from the rear; five times they were driven off with heavy loss, Römer himself being killed. Neipperg sent forward Göldlein's infantry, but they could not face the rapid fire of the Prussians, with their new iron ramrods. Seeing his enemy waver, and knowing his own ammunition to be failing, Schwerin, now in command, ordered the advance. In perfect formation, with colours flying and bands playing, the Prussian infantry bore down upon the demoralized Austrians, and Neipperg wisely anticipated a rout by ordering a retreat. Weak in cavalry, Schwerin made no effective pursuit. The Austrians lost 4,400 men and nine guns, the Prussians 4,613 and one gun. Frederick's own share in this, his first battle, scarcely foreshadowed his future glory.

MOLLY MAGUIRES, an Irish American secret society which maintained numerous branches in the anthracite coal regions of Pennsylvania, U.S.A., from 1854 to 1877, and perhaps later. The name was imported from Ireland, where it had been used to designate one of the Ribbon societies that devoted its energies to intimidating and maltreating process servers and agents of landlords. The Irish society of Molly Maguires seems to have been organized in 1843, and its membership to have been confined to the very lowest classes. The Molly Maguires of Pennsylvania consisted of similar classes of Irishmen, but there seems to have been no connection between the two societies. Every member of the American organization was also a member of the Ancient Order of Hibernians, an association organized for benevolent purposes, and having branches in the United States and Great Britain.

In the mining districts of Pennsylvania the organization fell under the control of a lawless element, which created the inner order of "Molly Maguires," with the object, it appears, of intimidating the Welsh, English and German miners, and of ridding the region of mine superintendents, bosses and police who should make themselves in any way objectionable to members of the order. Any member having a grievance might lay a formal complaint before his "body master," who thereupon conferred with the officers of the neighbouring divisions and secured members from a distance to make away with the offending person. Under this system the crimes in a given district were always committed by strangers. The society grew in strength during the Civil War. By 1875 it completely dominated the coal miners and forced a general strike. After repeated efforts to bring the criminals to justice had failed, Franklin B. Gowen (1836–1889), president of the Philadelphia and Reading Coal and Iron Company, sent James McParlan, an Irish Catholic and a Pinkerton detective to the mining region in 1873; he joined the order, and even became secretary of one of the most notoriously criminal lodges. The evidence he secured led to the arrest, conviction and execution or imprisonment of many members during the years 1876–77, and subsequently the outrages ceased and the society was disbanded.

Lucy, *The Molly Maguires of Pennsylvania; The Commonwealth versus John Kehoe et al.* (Pottsville, Pa. 1878); and an article by J. F. Rhodes in *Amer. Hist. Review* April, 1910.

MOLOCH or Molech (in Hebrew, with the doubtful exception of 1 Kings xi. 7, always "*the* Molech"), the name or title of the divinity which the men of Judah in the last ages of the kingdom were wont to propitiate by the sacrifice of their own children. The Hebrew consonants might simply be read "the king" (*mélek*), an appellation for the supreme deity of a Semitic state or tribe: the traditional pronunciation (Μολόχ), which goes back as far as the Septuagint version of Kings, probably means that the old form was perverted by giving it the vowels of *bōsheth* "shame," the contemptuous name for Baal (*q.v.*).

The phrase employed in speaking of these sacrifices is that of dedication—"to make one's son or daughter pass through (or by means of) fire to (the) Molech" (2 Kings xxiii. 10; but elsewhere without the words "through fire" Lev. xviii. 21). It appears from Jer. vii. 31, xix. 5; Ezek. xvi. 20 *seq.,* that this phrase denotes a human holocaust, and not a mere consecration to Molech by passing through or between fires. We learn from 2 Kings iii. 27 that the piacular sacrifice of his son and heir was the last offering which the king of Moab made to deliver his country. Even the Hebrew historian ascribes to this act the effect of rousing divine indignation against the invading host of Israel. Ahaz's sacrifice of his son (2 Kings xvi. 3) may have been an isolated act of despair; but in the 7th century, however, when religion was transformed into servile fear (Mic. vi. 1 *sqq.*), the example of

Manasseh (2 Kings xxi. 6) did not stand alone, and Jeremiah and Ezekiel frequently refer to the "high places" for the sacrifice of children by their parents which rose beneath the very walls of the temple from the gloomy ravine of Hinnom or Tophet (Jer. xxxii. 35; Ezek. xvi. 18 *sqq.*, xxiii. 37). The children apparently were not burned alive; they were slain and burned like any other holocaust (Ezek. *loc. cit.;* Isa. lvii. 5), their blood was shed at the sanctuary (Jer. xix. 4; Ps. cvi. 38).

The horrid ritual was so closely associated with Yahweh worship (Ezek. xxiii. 39) that Jeremiah protests that it is not of Yahweh's institution (vii. 31, xix. 5). So too the idea of sacrificing the firstborn to Yahweh is rejected in Micah vi. After all, such a sacrifice could only be paid to the supreme deity; and Manasseh and his people never ceased to acknowledge Yahweh as the God of Israel. Thus the way in which Jeremiah (Jer. xix. 5), Leviticus (xviii. 21, xx. 2–5) and the author of Kings, seem to mark out the Molech or Baal as a false god, distinct from Yahweh, is precisely parallel to the way in which Hosea speaks of the golden calves or Baalim. In each case the people were worshipping Yahweh under the title of Molech or Baal; and the prophet refuses to admit that this is so, because the worship itself is an apostasy to heathenism. Note, also, the explanation attempted in Ezekiel xx. 25 *seq.*, 31. The seat of the cult appears to have been at Jerusalem, and the period during which it flourished does not favour any strong Phoenician influence. Nor does it seem to be of Babylonian origin. On the whole, the biblical tradition that the Molech-cult was Canaanite and indigenous (Deut. xii. 29 *sqq.*, xviii. 9 *seq.*) holds the ground. *See* HEBREW RELIGION. (W. R. S.; S. A. C.)

MOLSHEIM, a town of France, capital of an arrondissement in the department of Bas-Rhin, at the foot of the Vosges, on the Breusch. Pop. (1926) 3,040. It is the seat of a sub-prefect. Its industries embrace the manufacture of iron and steel goods and organ-building. There is also some trade in wine and grain. Molsheim was known in the 9th century as Molleshem, and formerly was the seat of a famous Jesuit college, later removed to Strasbourg and united with its university.

MOLTKE, ADAM GOTTLOB, COUNT (1710–1792), Danish courtier, was born on Nov. 10, 1710, at Riesenhof in Mecklenburg. Frederick V. made him hofmarskal (court marshal), and overwhelmed him with marks of favour, making him a privy councillor and a count and bestowing upon him Bregentved and other estates. As the inseparable companion of the king, Moltke's influence soon became so boundless that the foreign diplomatists declared he could make and unmake ministers at will. Moltke looked askance at liberal projects for the emancipation of the serfs, but, as one of the largest landowners of Denmark, he did much service to agriculture by lightening the burdens of the countrymen and introducing technical and scientific improvements. On the decease of Frederick V., who died in his arms (Jan. 14, 1766), Moltke's dominion was at an end. The new king, Christian VII., could not endure him, and exclaimed, with reference to his lanky figure: "He's stork below and fox above." In July 1766 he was dismissed from all his offices and retired to his estate at Bregentved. He lived in retirement till his death on Sept. 25, 1792.

His memoirs, written in German and published in 1870, have considerable historical importance. *See* H. H. Langhorn, *Historische Nachricht über die dänischen Moltkes* (Kiel, 1871).

MOLTKE, ADAM WILHELM, COUNT (1785–1864), Danish statesman, son of the minister Joachim Godske Moltke (1746–1818), and grandson of Adam Gottlob Moltke, was born at Einsiedelsborg in Funen, on Aug. 25, 1785. In 1831 he succeeded Johan Sigismund Mösting (1789–1843), as minister of finance. On the death of Christian VIII. he was one of the most prominent members of the Council of State, and when the constitutional crisis came in 1848 he seemed marked out as the man who could bridge over the gap between the old era and the new. The services which Count Moltke rendered to Denmark cannot be too highly appreciated. The mere fact that a distinguished statesman who had served the last two absolute kings of Denmark now voluntarily placed himself at the head of a ministry which included the most advanced of the popular agitators, gave the new government prestige. It was this, his first administration, which introduced the constitution of June 5, 1849, and he also presided over the third constitutional ministry which was formed in July 1851; but he resigned on Jan. 27, 1852, because he could not approve of the decree which aimed at transforming Denmark into a composite, indivisible monarchy. Moltke continued to sit in the Landsting, or Upper House, but henceforth kept in the background. He was a member of the consultative Rigsraad from 1855 to 1863. He died on Feb. 15, 1864.

See Swalin, *Det danske Staatsraad* (Stockholm, 1881); Madvig, *Livserindringer* (Copenhagen, 1887).

MOLTKE, HELMUTH CARL BERNHARD, COUNT VON (1800–1891), Prussian field marshal, for thirty years chief of the staff of the Prussian army, the greatest strategist of the latter half of the 19th century, and the creator of the modern method of directing armies in the field, was born on Oct. 26, 1800, at Parchim, Mecklenburg, of a German family of ancient nobility. His father in 1805 settled in Holstein and became a Danish subject, but about the same time was impoverished by the burning of his country house and the plunder by the French of his town house in Lübeck, where his wife and children were. Young Moltke therefore grew up in straitened circumstances. At the age of eleven he was sent to the cadet school at Copenhagen, and entered the Danish army in 1818. But at twenty-one he resolved to enter the Prussian service, in spite of the loss of seniority, and he became second lieutenant in the 8th Infantry Regiment stationed at Frankfort-on-Oder. At twenty-three he entered the war academy, doing brilliantly in the final examination in 1826. He then for a year had charge of a cadet school at Frankfort-on-Oder, after which he was for three years employed on the military survey in Silesia and Posen. In 1833 he was transferred to the general staff in Berlin. His tastes inclined him to literature, to historical study and to travel. He published a short romance, *The Two Friends* (1827); an essay, *Holland and Belgium in their Mutual Relations . . .* (1831); and *An Account of the Internal Circumstances and Social Conditions of Poland* (1832). In 1832 he contracted to translate Gibbon's *Decline and Fall* into German, for which he was to receive £75, his object being to earn the money to buy a horse. In eighteen months he had finished nine volumes out of twelve, but the publisher failed to produce the book and Moltke never received more than £25.

Turkish Experience.—He had already travelled in south Germany and northern Italy, and in 1835 on his promotion as captain he obtained six months' leave to travel in south-eastern Europe. After a short stay in Constantinople he entered the Turkish service, being duly authorized to do so from Berlin. He spent two years at Constantinople, learned Turkish, and surveyed for the sultan the city of Constantinople, the Bosporus and the Dardanelles. He travelled in the sultan's retinue through Bulgaria and Rumelia, and made many other journeys on both sides of the Strait. In 1838 he was sent as adviser to the Turkish general commanding in Armenia, who was to carry on a campaign against Mehemet Ali of Egypt. He rode several thousand miles in the course of his journeys, navigating the dangerous rapids of the Euphrates, and visiting and mapping many districts where no European traveller had been since Xenophon. In 1839 the army moved south to meet the Egyptians, but upon the approach of the enemy the general became more attentive to the prophecies of the mullahs than to the advice of the Prussian captain. Moltke resigned his post of staff officer, and took charge of the artillery, which, in the ensuing battle of Nisib, was the last portion of the Turkish army to run away.

Moltke with infinite hardship made his way back to the Black Sea, and thence to Constantinople. His patron Sultan Mahmud was dead; so he returned to Berlin where he arrived, broken in health, in December 1839. When he left Berlin in 1834 he had already "the courtier's, soldier's, scholar's eye, tongue, sword." When he returned it was with a mind expanded by a rare experience, and with a character doubly tempered and annealed. While away, he had been a constant letter-writer to his mother and sisters, and he now revised and published his letters as

Letters on Conditions and Events in Turkey in the Years 1835 to 1839. No other book gives so deep an insight into the character of the Turkish Empire, and no other book of travels better deserves to be regarded as a German classic.

One of his sisters had married an English widower named Burt, who had settled in Holstein. Her stepdaughter, Mary Burt, had read the traveller's letters, and when he came home as a wooer was quickly won. The marriage took place in 1841, though there were no children, and Moltke's love-letters and letters to his wife are among the most valuable materials for his biography. On his return in 1840 Moltke had been appointed to the staff of the 4th army corps, stationed at Berlin; he was promoted major on his wedding day. He published his maps of Constantinople, of the Bosporus and of the Dardanelles, and, jointly with other German travellers, a new map of Asia Minor and a memoir on the geography of that country, as well as a number of periodical essays on various factors in the Eastern Question. His *Russo-Turkish Campaign in Europe, 1828–29, described in 1845 by Baron von Moltke, Major in the Prussian Staff* (1845), was recognized by competent judges as a masterpiece. Moltke at this period became one of the first directors of the Hamburg-Berlin railway, and in 1843 published a review article entitled *What Considerations should determine the Choice of the Course of Railways?* which reveals a mastery of the technical questions involved in railway construction.

In 1845 Moltke was appointed personal adjutant to Prince Henry of Prussia, a Roman Catholic who lived at Rome. He spent much of his leisure there in a survey, of which the result was a splendid map of Rome (Berlin, 1852). In 1846 Prince Henry died, and Moltke was then appointed to the staff of the 8th army corps at Coblenz. In 1848, after a brief return to the great general staff at Berlin, he became chief of the staff of the 4th army corps, of which the headquarters were then at Magdeburg, where he remained seven years, during which he rose to lieutenant-colonel (1850), and colonel (1851). In 1855 he was appointed first adjutant to Prince Frederick William (afterwards crown prince and emperor), whom he accompanied to England on his betrothal and marriage, as well as to Paris and to St. Petersburg to the coronation of Alexander II. of Russia. Prince Frederick William was in command of a regiment stationed at Breslau, and there as his adjutant Moltke remained for a year, becoming major-general in 1856. On Oct. 23, 1857, owing to the serious illness of King Frederick William IV., Prince William became prince regent. Six days later he selected Moltke to be chief of the general staff of the army.

Moltke devoted himself to the adaptation of strategical and tactical methods to changes in armament and in means of communication, to the training of staff officers in accordance with the methods thus worked out, to the perfection of the arrangements for the mobilization of the army, and to the study of European politics. In 1859 came the war in Italy, which occasioned the mobilization of the Prussian army, and a consequent reorganization, by which its numerical strength was nearly doubled. The reorganization was the work not of Moltke but of the king, and of Roon, minister of war; but Moltke watched the Italian campaign closely, and wrote the history of it ascribed on the title-page (1862) to the historical division of the Prussian staff.

The Danish Campaign.—In December 1862 Moltke was asked for an opinion upon the military aspect of the quarrel with Denmark then becoming acute. He sketched a plan for turning the flank of the Danish army before the attack upon its position in front of Schleswig, and hoped that by this means its retreat to the islands might be intercepted. When the war began in February 1864, Moltke was kept at Berlin. The execution of the plan was mismanaged, and the Danish army escaped to the fortresses of Düppel and Fredericia, each of which commanded a retreat across a strait on to an island. The allies were now checked; but Düppel and Fredericia were besieged by them, Düppel taken by storm, and Fredericia abandoned by the Danes without assault; but the war showed no signs of ending, as the Danish army was safe in the islands of Alsen and Fünen. On April 30 Moltke was sent to be chief of the staff to the commander-in-chief of the allied forces, and, so soon as the armistice of May and June was over, persuaded Prince Frederick Charles to attempt to force the passage of the Sundewitt and attack the Danes in the island of Alsen. The landing was effected on June 29, and the Danes then evacuated Alsen. Moltke next proposed a landing in Fünen, but the Danes no longer felt safe in their islands, and agreed to the German terms. Moltke's appearance had quickly transformed the aspect of the war, and his influence with the king thus acquired a firm basis.

Campaign of 1866.—(*See* SEVEN WEEKS' WAR.) Accordingly, in the Austrian campaign of 1866, Moltke's plans were adopted, and he was almost invariably supported in their execution. The campaign in Denmark had revealed the amazing superiority of the breech-loader, with which only the Prussian troops were armed, over the muzzle-loader still used by all other armies. Moltke had mastered, as none of his contemporaries had done, the methods of Napoleon. In 1866 each of his decisions was Napoleonic. The first was to employ almost his whole force (280,000) against the preponderant enemy, Austria, with her Saxon satellite (270,000) and to paralyse the other German states with a mere fraction (48,000). With this small force he first captured the whole Hanoverian army (17,000) and then dispersed the south German armies (about 100,000). The second decision was to deploy 280,000 men upon the very long frontier separating Prussia from Austria and Saxony, there to form three armies, the Elbe army at Torgau, the first army (Prince Frederick Charles) in Lusatia, and the second army (the Crown Prince) at Landshut and Waldenburg in Silesia. His plan, resembling that of Napoleon in 1805, was to bring these three armies together by a concentric advance into the enemy's territory, Bohemia, where he believed the Austrian army to be assembling. The three armies had no sooner reached these positions than the king was persuaded to order the second army to march eastwards towards Neisse to meet an expected Austrian invasion from Moravia. Moltke's plan seemed to be upset, but on June 15 the political crisis came to a head and Prussia declared war. On the same day Moltke learned that the Austrian army had assembled not in Bohemia, but in Moravia. He immediately instructed the Crown Prince to turn back and march westwards to his original positions, and the Elbe army to advance through Dresden to join Prince Frederick Charles, who was to advance southwards through Löbau. The Saxon army retreated from Dresden and joined the first Austrian army corp on the Isar. On the 17th Benedek, commanding the Austrian army, gave orders for its march from Moravia to the neighbourhood of Josefstadt. Moltke had expected this and calculated that the Austrian movement could not be completed in time to enable Benedek with his whole army to attack either of the Prussian armies. On June 22 Moltke ordered both Prussian armies to advance into Bohemia and to seek to unite in the direction of Gitschin. The Austrians marched faster than Moltke expected, and might have opposed the Crown Prince with four or five corps; but Benedek's attention was centred on Prince Frederick Charles, and he interposed against the Crown Prince's advance four corps not under a common command, so that they were beaten in detail, as were also the Saxons and the Austrian corps with them, by Prince Frederick Charles. On July 1 Benedek collected his already shaken forces in a defensive position in front of Königgrätz. Moltke's two armies were now within a march of one another and of the enemy. On July 2 Frederick Charles, who had passed Gitschin, ordered his army to attack this position, whereupon Moltke, who had that day reached Gitschin from Berlin, instructed the Crown Prince, who was at Königinhof, to advance with his whole force against the Austrian right flank. Next day the Austrian army was defeated in the greatest battle of the century.

Moltke now marched with the first army on Vienna. The Austrian Emperor then sued peace.

After the peace, the Prussian Diet voted Moltke the sum of £30,000, with which he bought the estate of Creisau, near Schweidnitz, in Silesia. *The Campaign of 1866 in Germany* (1867), produced under Moltke's personal supervision, was remarkable for its accuracy and reticence. On Dec. 24, 1868, Moltke's wife died at Berlin.

Franco-German War.—In 1870 suddenly came the war with France. The probability of such a war had occupied Moltke's attention almost continuously since 1857, and a series of memoirs is preserved in which from time to time he worked out and recorded his ideas as to the transport and arrangement of the Prussian or German forces for the opening of the campaign. The great successes of 1866 had strengthened Moltke's position, so that when the mobilization order of the Prussian and south German forces was issued (July 15, 1870) his plans were adopted without dispute, and five days later he was appointed "Chief of the general staff of the army at the headquarters of H.M. the King" for the duration of the war. This gave Moltke the right to issue in the king's name, though of course not without his approval, orders which were equivalent to royal commands. Moltke's plan was to assemble the whole army to the south of Mainz. If the French should disregard the neutrality of Belgium and Luxemburg, and advance on the line from Paris to Cologne or any other point on the Lower Rhine, the German army would be able to strike at their flank, while the Rhine itself, with the fortresses of Coblenz, Cologne and Wesel, would be a serious obstacle in their front. If the French should attempt to invade south Germany, an advance of the Germans up either bank of the Rhine would threaten their communications.

Moltke expected that the French would be compelled by the direction of their railways to collect the greater part of their army near Metz, and a smaller portion near Strasbourg. The German forces were grouped into three armies: the first of 60,000 men, under Steinmetz, on the Moselle below Trèves; the second of 131,000 men, under Prince Frederick Charles, round Homburg, with a reserve of 60,000 men behind it; the third under the Crown Prince of 130,000 men, at Landau. Three army corps amounting to 100,000 men were not reckoned upon in the first instance, as it was desirable to keep a considerable force in north-eastern Germany, in case Austria should make common cause with France. If, as seemed probable, the French should take the initiative before the German armies were ready, and for that purpose should advance from Metz in the direction of Mainz, Moltke would merely put back a few miles nearer to Mainz the points of debarcation from the railway of the troops of the second army. This measure was actually adopted, though the anticipated French invasion did not take place.

Moltke's plan of operations was that the three armies while advancing should make a right wheel, so that the first army on the right would reach the bank of the Moselle opposite Metz, while the second and third armies should push forward, the third army to defeat the French force near Strasbourg, and the second to strike the Moselle near Pont-à-Mousson. If the French army should be found during this advance in front of the second army, it would be attacked in front by the second army and in flank by the first or the third or both. If it should be found on or north of the line from Sarrebourg to Lunéville, it could still be attacked from two sides by the second and third armies in co-operation. The intention of the great right wheel was to attack the principal French army in such a direction as to drive it north and cut its communications with Paris. The fortress of Metz was to be observed, and the main German forces to march upon Paris.

This plan was carried out in its broad outlines. The battle of Wörth was brought on prematurely, and therefore led, not to the capture of MacMahon's army, which was intended, but only to its total defeat and hasty retreat as far as Châlons. The battle of Spicheren was not intended by Moltke, who wished to keep Bazaine's army on the Saar till he could attack it with the second army in front and the first army on its left flank, while the third army was closing towards its rear. But these unintended or unexpected victories did not disconcert Moltke, who carried out his intended advance to Pont-à-Mousson, there crossed the Moselle with the first and second armies, which he then ordered to face north and wheel round in order to cut off Bazaine from Paris. But Frederick Charles, contrary to these instructions, directed the second army towards the Meuse and consequently found himself with only two corps facing the whole French army at Mars-la-Tour. The two corps, however, defeated Bazaine (August 16), who retreated to the position St. Privat-Gravelotte. Next day Moltke brought up the rest of the second army and on the 18th attacked Bazaine and drove him into the fortress of Metz. Moltke has been blamed for the last local attack at Gravelotte, in which there was a fruitless heavy loss, but it is now known that this attack was ordered by the king, and Moltke blamed himself for not having used his influence to prevent it.

During the night following the battle Moltke made his next decision. He left one army to invest Bazaine and Metz, and set out with the two others to march towards Paris, the more southerly one leading, so that when MacMahon's army should be found the main blow might be delivered from the south and MacMahon driven to the north. On Aug. 25 it was found that MacMahon was moving north-east for the relief of Bazaine. The moment Moltke was satisfied of the accuracy of his information, he ordered the German columns to turn their faces north instead of west. MacMahon's right wing was attacked at Beaumont while attempting to cross the Meuse, his advance necessarily abandoned, and his army with difficulty collected at Sedan. Here the two German armies were so brought up as completely to surround the French army, which on Sept. 1 was attacked and compelled to raise the white flag. After the capitulation of Sedan, Moltke resumed the advance on Paris, which was surrounded and invested. From this time his strategy is remarkable for its judicious economy of force, for he was wise enough never to attempt more than was practicable with the means at his disposal. The surrender of Metz and of Paris was a question of time. In this Moltke was completely successful. Metz surrendered on Oct. 27, and on Jan. 28, 1871, an armistice was concluded at Paris and the war ended.

On Oct. 29, 1870, Moltke was created graf (count or earl) and on June 16, 1871, field marshal. After the war he superintended the preparation of its history, which was published between 1874 and 1881 by the great general staff. In 1888 he resigned his post as chief of the staff. In 1867 Moltke was elected to the North German Diet, and in 1871 to the Reichstag. His speeches, dealing mostly with military questions, were regarded as models of conciseness and relevancy. He died suddenly on April 24, 1891, and after a magnificent funeral ceremony at Berlin his remains were laid beside those of his wife in the chapel at Creisau.

As a strategist Moltke cannot be estimated by comparison with Frederick or Napoleon, because he had not the authority either of a king or of a commander-in-chief. While it is doubtful whether he can be convicted of any strategical errors, it seems beyond doubt that he never had to face a situation which placed any strain on his powers, for in the campaigns of 1866 and 1870 his decisions seemed to be made without the slightest effort.

Authorities.—*Gesammelte Schriften und Denkwürdigkeiten des General Feldmarschalls Grafen Helmuth von Moltke* (8 vols., Berlin, 1892–93); *Moltke's militärische Werke* (Berlin, 9 vols., 1892–1900); *Feldmarschall Moltke*, by Max Jähns (3 vols., Berlin, 1894–1900); F. E. Whitton, *Moltke* (1921); Spenser Wilkinson, *The Brain of an Army*, new edition *with letters from Count Moltke and Lord Roberts* (1913); v. Schmerfeld, *Graf Moltke, Die deutschen Aufmarschpläne 1871–1890* (1929); in this volume are published for the first time Moltke's plans of campaign against France and Russia.

MOLTKE, HELMUTH JOHANNES LUDWIG VON (1848–1916), German soldier, born in Gersdorf, Mecklenburg, May 23, 1848, was nephew of the famous Count von Moltke. Becoming an officer in 1870, in 1902 he commanded the 1st Division of the Guards Corps, in 1904 became quartermaster-general, and two years later was appointed chief of the general staff of the army. At the outbreak of the World War, although already old and in failing health, he became principal director of the German operations. His strategy, based partly on the plans bequeathed to him by Gen. von Schlieffen (*q.v.*), whose pupil he had been, was devised to meet the problem of a war on two fronts. It involved a concentration of forces on the right flank, which, pivoting on Metz, and driving forward against the line Dunkirk-Verdun, was to force the French army to give battle on a reversed front. In the West, the left flank was to be held back, the troops in Alsace were to withdraw behind the Rhine, while a minimum defence was to face Russia. Bold and simple as was this plan, it neither allowed for the swift mobilization of the Russians, nor

for the problem of a shifting front. Forced by circumstances to introduce modification into the original plan, Moltke appears to have been unwise in his alterations. He withdrew six divisions from the main army to send to the Russian front, failed to concentrate on the north-east, and planned an offensive in place of a defensive in Lorraine. Thus the plans of von Schlieffen were prevented from bearing full fruit. For failing to co-ordinate the position of the German forces on the eve of battle, and for issuing confusing orders, Moltke has been charged with causing the German defeat at the battle of the Marne. He has also been blamed for placing Bülow, who was already in command of Kluck's second army, at the head of the first.

On Nov. 3, 1914, his health being seriously impaired, he was relieved of his post to make way for Falkenhayn, and was appointed chief of the home general staff in Berlin. He died on June 18, 1916. The following works by him were published after his death: *Erinnerungen, Briefe, Dokumente, 1877–1916* (1922), *Aufzeichnungen, Briefe, Schriften, Reden* (1923).

MOLUCCAS or **SPICE ISLANDS** (Dutch, *Molukken*), a name which in its wider sense includes all the islands of the Malay archipelago between Celebes on the west, New Guinea on the east, Timor on the south, and the open Pacific ocean on the north. They are thus distributed over an area between 2° 43′ N. and 8° 23′ S. and 124° 22′ and 135° E., and include: (1) the Moluccas proper or Ternate group, of which Halmahera is the largest and Ternate the capital; (2) the Bachian and Obi groups; (3) the Amboyna group, of which Ceram (Serang) and Buru are the largest; (4) the Banda islands (the spice or nutmeg islands *par excellence*); (5) the south-eastern islands, comprising Larat, Babar, etc.; and (6) the Kei islands and the Aru islands, of which the former are sometimes attached to the south-eastern group. The whole of Dutch New Guinea is included administratively with the Moluccas. Formerly the Moluccas were divided into two residencies, Ternate and Amboyna. In 1923 these residencies were united under one Government, *i.e.*, that of the Moluccas.

Most of the islands are mountainous, with still active volcanoes. As they lie near or under the Equator, the monsoons blowing over them are less regular, and the rainfall, of large volume throughout the year, is dependent on the height and direction of the chains. The vegetation of the small and narrow islands, all encompassed by the sea, is very luxuriant, and the products, principally nutmegs, mace, and other spices, include also copra, rice, sago, cajeput oil, damar, timber, trepang, pearls, pearl-shell, shells, tortoiseshell and bird-of-paradise plumes. In the main the flora of the Moluccas is of extreme fertility, and many Australian forms are intermingled with the predominating Asiatic. The flora of New Guinea is distinctly individual to the island. The fauna of the Moluccas is peculiar in its distribution. Land mammals are very few; *Viverra tangalunga* is the only carnivorous representative, the only ruminant a deer, and the only quadrumanous animal the baboon, *Cynopithecus nigrescens*. The strangely-formed babirusa of Celebes is found in the Sula isles and Buru. The little shrew, the wild pig, flying opossum and cuscus are common. Bird-life is profuse, parrots, king-fishers and doves predominating; most curious are the mound-builders, *Megapodidae*, and the large cassowary of Ceram; most beautiful the bird-of-paradise. New Guinea and the Aru isles are Australian in fauna. Insect life is even richer. In the gorgeous *Ornithoptera* butterflies have reached probably their highest state of development; the insects are remarkably beautiful even when compared with those of other parts of the archipelago. Fish and shell-fish abound in extraordinary variety. Poisonous snakes and man-eating crocodiles are found in New Guinea. The inhabitants are of mixed descent.

The geology of the Moluccas is imperfectly known. The great chain of volcanoes which runs through Sumatra and Java is continued eastwards into the Moluccas, and terminates in a hook-like curve which passes through the Damar islands to the Banda group. Outside this hook lies a concentric arc of non-volcanic islands, including Tenimber, the Lesser Kei islands, Ceram and Buru; and beyond is still a third concentric arc extending from Talaibu to the Greater Kei islands. The islands of these outer arcs consist chiefly of crystalline schists and limestones, overlaid by Jurassic, Cretaceous and Tertiary deposits.

The name Moluccas is said to be derived from the Arabic for "king." Argensola (1609) uses the forms *islas Malucas, Maluco*, and *el Maluco;* Coronel (1623), *islas del Moluco;* and Camoens, *Maluco*. After Magellan's passage round Cape Horn to the Far East, the Spanish had laid claim to the Moluccas under the Treaty of Tordesilas (1494), but in 1528 they were bought out by the Portuguese, whose influence in the Moluccas was predominant until the arrival of the Dutch early in the 17th century. Finding the power of the sultan of Ternate too strong in the north Moluccas, the Dutch concentrated on the southern islands, particularly Amboyna and Banda. The Bourgay Contract (1667), gave them an opening in the north, the friendship of the sultan of Ternate aided them immensely, and when in 1685 the Dutch declared all contracts with the sultan of Ternate void, they took the northern Moluccas under their rule, and with them went New Guinea, which, with the northern and southern isles, was gradually consolidated into the Moluccas of to-day. (*See* further MALAY ARCHIPELAGO, and separate articles on the principal islands and groups.)

MOLY, a mysterious plant with magical powers described in Homer, *Odyssey*, x. 302–306 (Gr. μωλυ). Hermes pulls it up and gives it to Odysseus as a protection against the arts of Circe. It is further described as "having a black root and a flower like milk, and hard for mortals to pull up." R. M. Henry in *Class. Rev.* (Dec. 1906), p. 434, who illustrates the Homeric account by passages in the Paris and Leyden magical papyri, argues that *moly* is probably a magical name, derived perhaps from Phoenician or Egyptian sources, for a plant which cannot be certainly identified. He shows that the "difficulty of pulling up" the plant is not a merely physical one, but rather connected with the peculiar powers claimed by magicians.

In modern times the name has been applied to a species of onion (*Allium Moly*), a native of southern Europe, grown in borders and rock gardens for its ornamental bright yellow flowers.

MOLYBDENITE, a mineral consisting of molybdenum disulphide, MoS_2. It closely resembles graphite in appearance, but may readily be distinguished from this by its greater density (4·7) and by its behaviour before the blowpipe. Crystals have the form of six-sided plates or scales, but they are never sharply defined, and their reference to the hexagonal system is doubtful. They have a perfect cleavage parallel to the large surface of the plates, and the flakes are readily bent, but are not elastic. The mineral is very soft (H=1 to 1·5) and unctuous, and makes a bluish-grey mark on paper; it is opaque and has a bright metallic lustre. The colour is lead-grey, differing slightly from that of graphite in having a bluish tinge. The name is from Gr. ὀλυβδος, lead or lead ore, with which graphite (black-lead) and molybdenite were confused; the latter was distinguished by P. J. Hjelm, who in 1782 discovered the element molybdenum in this mineral.

Molybdenite occurs as disseminated scales in crystalline rocks —such as granite, gneiss, schist and marble—and also in quartz-veins. It is fairly common in small quantities as one of the first minerals formed in high-temperature veins, along with tinstone, wolframite and bismuth compounds. The commercially workable deposits, however, belong to several different types, as follows: In pegmatites and quartz-veins associated with granite, *e.g.*, Canada, Saxony and Telemarken, Norway; as segregations in granite, *e.g.*, Moss mine, Quyon, Quebec; in metamorphic zones at the contact of granite and limestone (contact pyroxenite), Pontiac county, Quebec; in pipes of granite, with wolfram and bismuth, Queensland and the New England area of New South Wales.

Molybdenite has been used mainly for the preparation of molybdates for use as chemical reagents, and also in the manufacture of molybdenum steel (ferro-molybdenum), which by reason of its hardness and toughness is specially suitable for tools.

MOLYBDENUM (symbol Mo, atomic number 42, atomic weight 96). Pure compact molybdenum is a silvery white metal, softer than steel and quite malleable. Its melting point is very high, probably 2,500°C., whilst its tensile strength when drawn into wire, is about half that of tungsten or steel wire of the same diameter. Crude grey molybdenum, an electric-furnace product made direct from molybdenite, is impure owing to ab-

sorption of carbon. It is very brittle, with a hardness greater than that of quartz. Varying figures, *e.g.*, 9·01, 8·95, 10·28, are given for the density of the pure metal. The electrical resistance of ductile molybdenum is 5·6 microhms per c.c. for hard-drawn wire and 4·8 for annealed wire. Molybdenum is not appreciably affected by air at ordinary temperatures but at a dull-red heat the oxide is slowly formed. It is somewhat resistant to the action of acids but less so than tungsten. Concentrated hydrochloric and sulphuric acids attack it only very slowly, whilst moderately dilute nitric acid, like *aqua regia,* rapidly reacts with the metal. Concentrated nitric acid induces passivity. Molybdenum is attacked by fused but not by aqueous caustic alkalis. The most important alloy of molybdenum is ferro-molybdenum which is made in the electric furnace by fusing molybdenite concentrates with varying proportions of coke, lime, scrap iron, pyrites, etc. This is the usual form in which molybdenum is added to steels. There are also many types of non-ferrous molybdenum alloys. The non-ferrous stellite alloys, which are silver-white, insoluble in nitric acid and only slowly attacked by hydrochloric acid, are said to possess exceptional qualities when used for high-speed cutting tools. A typical molybdenum stellite gave the following analysis: Mo, 22·50; Co, 59·50; Cr, 10·71; Fe, 3·11; Mn, 2·04; C, 0·87; Si, S, and P, balance. Other alloys are chrome-molybdenum, nickel-molybdenum, ferro-molybdenum-tungsten and copper-nickel-molybdenum. Metallic molybdenum has come into use for a variety of electrical purposes, such as a support for lamp filaments, winding for electrical resistance furnaces, X-ray apparatus, plates used in wireless telegraphy, etc. High molybdenum steels, containing over 1% of the metal, are used for permanent magnets, rustless steels, and high-speed tools; whilst low molybdenum steels, containing less than 1% of the metal, find use for automobile parts, agricultural implements, railway forgings and track bolts.

The name molybdena which occurs in the writings of Pliny was employed by him to denote various substances containing lead. Later, this name was used to designate galena—the naturally occurring compound of lead and sulphur—or substances of similar appearance, whilst by the middle of the 18th century it was applied solely to graphite and the mineral sulphide of molybdenum which now bears the name of molybdenite. In view of their similar appearances it is not surprising that these two substances were classified together at this period. K. W. Scheele first pointed out, in his "Treatise on Molybdena" (1778), the essential difference between them. He showed, that unlike graphite, this other mineral, on treatment with nitric acid produced a "peculiar white earth" with acidic properties to which he assigned the name, molybdic acid. Further, since this same mineral, on heating gave rise to sulphurous fumes, he concluded correctly that molybdenite was a sulphide of molybdenum. Finally, in 1790, appeared an account, by P. J. Hjelm of the isolation of the new element molybdenum, as a metallic powder, by heating the oxide with carbon. Molybdenum is never found free in nature but always chemically combined with other elements. Although a large number of minerals containing molybdenum have been described, only two of them are so far of any practical importance, namely, molybdenite and wulfenite (*q.v.*).

Concentration of Molybdenum Ores.—As the percentage of pure molybdenite (MoS_2) present in the molybdenum ore is generally only ½%, the importance of a successful method for separating and concentrating the molybdenite can be readily appreciated and at one time represented a real difficulty to the industry. The application of oil flotation, however, has gone far to solve this difficulty, and molybdenite, when fairly clean, is now one of the easiest minerals to concentrate. The concentration of wulfenite ores is simplified by the fact that the mineral is heavy and easily wetted, so that any of the gravity methods may be applied. The presence of heavy minerals such as lead ores, including vanadinite, however, complicates the separation.

Preparation of the Metal.—There are several methods by which molybdenum may be obtained from its ores. Using the molybdenite concentrates, two methods are generally employed. In the alumino-thermic process—the one mainly in use—the metal is obtained by igniting a mixture of finely divided aluminium and the concentrate. The metal may contain as much as 2% of iron and small quantities of silicon. In the electric fusion process, the molybdenite concentrates are heated in a carbon tube by a current of 350 ampères at 60 volts. Sulphur dioxide is expelled, but to expel completely the sulphur the current is afterwards increased to 900 ampères at 50 volts. The metal so produced may contain considerable carbon but this can be removed by heating with molybdic oxide. The special treatment of wulfenite, from which about 10% of the world's supply of molybdenum is derived, has been studied by J. P. Bonardi, who has made a detailed report on this subject in *Chem. and Met. Eng.*, p. 364, 1919.

Chemical Properties.—Molybdenum compounds exhibit valencies of 6, 5, 4 and 3 while halogen derivatives exist corresponding with the empirical formula $MoCl_2$, but having the molecular formula Mo_3Cl_6. The most important and most stable compounds of molybdenum are those in which the metal is hexavalent. The trioxide, MoO_3, which may be made by roasting molybdenite in a current of air, is a white powder which can be completely volatilized at approximately 700°C., although appreciable volatilization occurs at 450–500°C. Heated to 150–200°C. in a current of hydrogen chloride the trioxide sublimes as $MoO_3 2HCl$. The oxide has both acidic and basic properties, for it dissolves in hot concentrated sulphuric or hydrochloric acid while with bases it forms molybdates containing varying ratios of MoO_3, to metallic oxide. Molybdenum forms many complex salts. In $Ag_2[MoO_4]$, the molybdenum has a co-ordination number of four, and X-ray analysis shows that the oxygen atoms are tetrahedrally distributed round the central molybdenum atom. The complex salts

$$K_3[MoCl_6],\ K_2[MoOCl_5]$$

and

$$MoO_2\bar{A}c_2\ (\bar{A}c = \text{an acetyl-acetone radical, } C_5H_7O_2)$$

exhibit molybdenum with a co-ordination number of six, and there is evidence that in such substances the associating units are arranged octahedrally round the molybdenum. In other derivatives, such as $K_4[Mo(CN)_8]$, a co-ordination number of eight is indicated.

Field tests for molybdenite: (*a*) Rubbed on porcelain or a white enamelled cup, molybdenite leaves a grey-green streak. (*b*) Heated on charcoal in the oxidizing flame, the powdered mineral emits a strong, sulphurous odour and deposits molybdic oxide, which is yellow when hot and white when cold. Nearer to the heated mineral, the coating is copper red. If the white coating is touched intermittently with the reducing flame, it becomes deep blue.

REFERENCE. *Molybdenum,* Publication No. 592, 1925, Department of Mines, Canada. (W. WA.)

Molybdenum Steels.—On account of its chemical similarity with tungsten, molybdenum was early substituted for the latter in Mushet's (*q.v.*) air-hardening steel, in modern high speed steels (*q.v.*) and various magnet steels. Research and experience since 1917 has shown that a fractional per cent of molybdenum (0·40% maximum) in heat-treated alloy steel is very useful to intensify the characteristic action of the other elements present, to induce air-hardening and to increase toughness. Such materials may be characterized as "molybdenized" alloy steels, rather than molybdenum steels. About 250,000 tons were made in 1928.

Most molybdenum-bearing steel used in 1929 was a medium carbon, low chromium analysis, ranging between the following limits: carbon 0·25 to 0·40%; manganese 0·40 to 0·70%; chromium 0·50 to 1·10%; molybdenum 0·15 to 0·30%. It is made into axles and other highly stressed parts. The lower alloys are water-hardened, the higher ranges hardened in oil. The steel is readily machineable even when heat-treated to a yield point of 150,000 lb. per square inch. Molybdenized 1% chromium steel (low in carbon) is the U.S. army standard material for aeroplane fuselage construction. It draws readily into thin-walled seamless tubing of great strength; it welds readily, and on account of its air-hardening propensities, the welded joints in the skeleton structure develop 90% efficiency. Molybdenized chromium-nickel steels (0·75 Cr, 1·5 Ni, 0·60 C) are used for large die blocks and such parts which must be uniformly hard to the very centre. A 6 in. piece can be air-hardened and tempered to Brinell hardness of 430

at corners, 418 at face and 402 at centre. The only molybdenized nickel steel in 1929 finding important use had 1½% nickel and 0·15% carbon. It is made into case-hardened parts like ball-bearing races. (E. E. T.)

MOLYNEUX. This historic English name came into the country from France at the time of the Norman Conquest through William de Molines (Moleyns, Molyneux), who obtained a grant of Sefton, in Lancashire, whence come the present earls of Sefton. His descendant Adam de Molyneux (Moleyns or Molins), who died in 1450, was bishop of Chichester and keeper of the privy seal; he was a son of Sir Richard Molyneux of Sefton, and uncle of the Sir Richard Molyneux (d. 1459), the Lancastrian favourite of Henry VI., whose descendant Richard Molyneux (1593–1636) was created in 1628 1st Viscount Molyneux of Maryborough, a title now merged in that of Sefton (created 1771). Another Molyneux family of some importance is the Irish one, descended from Sir Thomas Molyneux (1531–97), Irish chancellor of the exchequer, who, born at Calais, settled in Ireland in 1576. He was the great-grandfather of Sir Thomas Molyneux, Bart. (1661–1733), a well-known physician and zoologist, and of William Molyneux (1656–98), the philosopher, astronomer and politician, the friend of Locke, and author of *Dioptrica nova* (1692), whose famous work on the legislative independence of Ireland (*The Case of Ireland*, etc., 1698) created much stir at the time. The latter's son Samuel (1689–1728) was also a well-known astronomer.

MOM. A system of signs invented by Njoya about 1900, and written by a small group in the Cameroons. Over 300 separate signs were first used; the progress from purely pictographic representation to syllabaries and alphabetic forms is notable.

See Göhring, *Der Evangelische Heidenbote*, vol. lxxx. (1907) no. 6 and no. 11; also Van Gennep. *Religions, Moeurs et Légendes* (2nd series, p. 259 *sq.*).

MOMBASA, the chief port of Kenya Colony, East Africa, in 4° 4′ S.; 39° 43′ E. and 150 m. north of Zanzibar. It is built on a coralline island situated at the mouth of a deep arm of the sea. It had a population (1921) of 36,846, of whom 656 were Europeans and 7,574 British Indians. In 1924 the population had increased to 42,000 (821 Europeans). Mombasa harbour takes vessels up to 30 ft. draft, but is now used mainly by dhows; the principal harbour is Kilindini, at the southwest end of Mombasa island.

Spacious and land-locked Kilindini accommodates vessels of any size and takes all the traffic of the Kenya and Uganda railway which, starting from Mombasa, is carried to the mainland on a bridge half a mile long. A causeway is built by the side of the bridge, a navigable channel of 180 ft. being left. A deep-water wharf with two berths provided with all facilities for loading and unloading, built by the Government at a cost of over £1,000,000, was completed in 1926. A third berth was added in 1928. Much of the cargo had still, however, to be handled by lighters and the administration acquired large areas for development purposes. In 1898 the value of imports and exports combined was £370,000; in 1928 about £20,000,000. The increase indicates the growing trade of Kenya and Uganda.

Viewed from the sea Mombasa has a picturesque apearance, the most conspicuous object being the fort, built on a coral hill 40 ft. high. Except for the main street and Government Square, Mombasa is like any Oriental city—a maze of narrow, irregular streets and lanes. Some of the houses have finely carved doorways. To the south, overlooking the sea, is the European suburb. The public buildings include an Anglican cathedral, a Roman Catholic church, Hindu, Parsee, and Mohammedan temples, and schools, hospitals and law courts, the last named completed in 1902. Built into the façade of the law courts is a stone with an inscription recording the building of a fort, dedicated to St. Joseph, by the Portuguese at Kilindini in 1666. This stone was found in the ruins of Fort St. Joseph. Mombasa Fort, or citadel, quadrangular in form, reddish in colour, was built by the Portuguese in 1593–1595 and known as the Jesus Fort. It bears the symbol I.H.S. The fort was repaired by Seixas de Cabreira in 1635. The population of the town is cosmopolitan, with three well-marked racial distinctions: the Arab (Swahili), the Indian and the European. The climate is fairly healthy, and Europeans live there in tolerable comfort. The average annual rainfall is 47 inches.

Mombasa island (named after the town) is 3 m. long by 2½ m. broad, with an area of 9 sq.m. Except at the western end, the coast consists of cliffs from 40 ft. to 60 ft. high. The island contains many plantations, chiefly of coco-nut palms. Ruins of Arab, Portuguese and Turkish buildings are found in various parts of the island. At Ras Serani are the ruins of a chapel "Nossa Senhora das Merces," built by the Portuguese in the 17th century on the site of a Turkish fort, and turned into a fort again by the Arabs.

Mombasa takes its name from the Mombasa in Oman. A Perso-Arabic settlement was made here about the 11th century. It is mentioned by Ibn Batuta in 1331 as a large place, and at the time of Vasco da Gama's visit (1498) it was the seat of considerable commerce, its inhabitants including a number of Calicut Banyans and Oriental Christians. The ruler of the city tried to entrap da Gama (or so the Portuguese navigator imagined), and with this began a series of campaigns which gave full force to its Swahili name *Mvita* (war). The principal incidents are the capture and burning of the place by Almeida (1505), Nuno da Cunha (1529), and Duarte de Menezes (1587)—this last as a revenge for its submission to the sultan of Constantinople—the revolt and flight (1631) of Yusuf ibn Ahmed (who murdered all the Portuguese in the town—over 100), and the three-years' siege by the imam of Oman 1696–98 (the garrison being reduced to eleven men and two women), ending in the expulsion of the Portuguese. From March 12, 1728 to Nov. 29, 1729 a Portuguese force from Goa again held Mombasa, when they were finally driven out by the Muscat Arabs. In Dec. 1823 the Mazrui family, who had ruled in Mombasa from the early part of the 18th century, first as representatives of Oman, afterwards as practically independent princes, placed the city under British protection; and in Feb. 1824 Lieut. J. J. Reitz was appointed commandant or resident at the city by Captain (afterwards Vice-Admiral) W. F. W. Owen. Reitz, after whom Port Reitz (a deep ramification of the sea opposite Kilindini) is named, died at Mombasa either in 1824 or 1825. The protectorate was repudiated by the British government, which left the place to be bombarded and captured by Seyyid Said of Oman, who made repeated attacks between 1829 and 1833, and only got possession in 1837 by treachery. Said thereafter made Zanzibar his capital, Mombasa becoming of secondary importance. A revolt against Zanzibar in 1875 was put down with British assistance. The British government in the following year vetoed a proposal by the khedive Ismail to annex Mombasa and its hinterland up to the equatorial lakes to Egypt—a project which originated with General C. G. Gordon, when that officer administered the Upper Nile provinces. In 1887 the city was handed over by the sultan of Zanzibar to the British for administration. It became the capital of the East Africa protectorate (Kenya Colony). In 1907, however, the seat of the central government was removed to Nairobi. From 1921 till his death in 1927 Mombasa was the residence of Seyyid Khalid the two-days' sultan of Zanzibar. Mombasa still forms part of the sultanate of Zanzibar and is included in Kenya protectorate as distinct from Kenya colony. *See* ZANZIBAR and KENYA COLONY.

MOMEIN: *see* TENGYUEH.

MOMMSEN, THEODOR (1817–1903), German historian and archaeologist, was born on Nov. 30, 1817 at Garding, in Schleswig. After being educated at Kiel he devoted himself to the study of Roman law and antiquities. In 1843 a grant from the Danish government enabled him to go to Italy, where he began his important investigation of Roman inscriptions. He collected the inscriptions of Samnium, and in 1852 published those of the kingdom of Naples. He was appointed in 1848 professor of civil law at Leipzig. His work there was interrupted by his political opinions. During 1848, when the extreme party was in the ascendant, Mommsen supported the monarchy. When the Revolution had spent its force and Beust executed his *coup d'état,* he protested, with many of his colleagues, against this act. In consequence he was dismissed from his professorship.

Becoming professor at Zürich, Mommsen wrote exhaustive monographs on Roman Switzerland, and began to work on his *Roman*

History, the three volumes of which appeared between 1854 and 1856 (8th Germ. ed. 1888–94, Eng. trans. in Everyman series, 4 vols. 1911). In this he painted with astonishing vigour the great political struggle that accompanied the fall of the republic, but it was, above all, his new reading of old characters which demanded attention. Cicero, the favourite of men of letters, was for him "a journalist in the worst sense of the word"; Pompey, the hero of Plutarch and the Moralists, was brushed aside as a mere drill-sergeant; and the book culminated in the picture of Caesar, who established absolute rule in the name of democracy, "the complete and perfect man."

In 1854 the Berlin Academy made him chief editor of a *Corpus* of all extant Roman inscriptions and in order that he might carry on the work he was appointed in 1858 to a professorship at Berlin. The first volume appeared in 1861; five of the succeeding volumes he edited himself, and the whole was executed under his supervision and with the co-operation of scholars whom he had trained. Mommsen also found time to write two larger works, the *History of the Roman Coinage* and the *Römisches Staatsrecht,* a profound analysis of Roman constitutional law, and *Römisches Strafrecht,* on Roman criminal jurisdiction. His *Roman Provinces* previously published in 1884 (Eng. trs. 2 vols. 1909) gives an interesting picture of social life under the empire. He was one of the founders of the *Preussische Jahrbücher,* and for many years a member of the Prussian Parliament.

Equally great as antiquary, jurist, political and social historian, Mommsen lived to see the time when among students of Roman history he had pupils, followers, critics, but no rivals. He combined the power of minute investigation with a singular faculty for bold generalization and the capacity for tracing out the effect of thought on political and social life. Mommsen died at Charlottenburg on Nov. 1, 1903.

In addition to the above, Mommsen's chief publications are: the *Roman Chronology to the Time of Caesar* (1858); his editions of the *Monumentum Ancyranum* and of the *Digest* in the *Corpus juris civilis,* and of the *Chronica* of Cassiodorus in *Monumenta Germaniae historica,* the *Auctores antiquissimi* section of which was under his supervision. Many of his pamphlets and articles have been collected under the title *Römische Forschungen.* His *Reden und Aufsätze* appeared in 1905 and his *Schriften* in 1905 foll. A full list of his works is given by C. Zangemeister, *Mommsen als Schrifsteller* (1887; continued by Jacobs, 1905). *See* also monographs by C. Bardt (1903) and Gradenwitz (1904, in the *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte*); O. Hirschfeld, *Gedächtnisrede auf Mommsen* (1904); L. M. Hartmann, *T. Mommsen* (1908) and M. Wilamowitz-Moellendorf, *T. Mommsen* (1918).

MOMORDICA, in botany, a genus of annual or perennial climbing herbs belonging to the family Cucurbitaceae, natives of the tropics, especially Africa, and known in cultivation chiefly as hothouse plants. They are grown for their ornamental fleshy fruits, which are oblong to cylindrical in shape, orange to red in colour, prickly or warted externally, and burst when ripe, generally with elastic force, into irregular valves. *M. Balsamina,* known as balsam apple, is a very pretty annual, well adapted for trellises, etc., in warm outside situations, as is also *M. Charantia,* the balsam pear, a somewhat larger species.

MOMOTIDAE: *see* Motmot.

MOMUS, in Greek mythology, the son of Night (Νύξ), the personification of censoriousness. He is frequently mentioned as a sort of licensed grumbler, finding fault with all that the gods do: hence the proverb "even Momus could not find fault" (Plat. *Rep.* 487A) to denote perfection. He appears very seldom in serious works (*Cypria,* frag. 1): a lost satyr-play of Sophocles bore his name. Lucian often introduces him, and he appears in a well known Aesopic fable.

See Hesiod, *Theog.* 214; Lucian, *Hermotimus,* 20, and especially *Deorum Concilium;* Philostratus, *Epistolae,* 37.

MONA, the name used by classical writers, and in particular by Tacitus, to denote Anglesey (*q.v.*). This island was raided by the Roman general Suetonius about A.D. 60 and conquered by Agricola about A.D. 79. The Romans probably mined copper there, but no trace has yet been found of any Roman military post, and the villages of the inhabitants which have been recently excavated show only mediocre traces of Roman civilization. The name Mona seems also to have been occasionally used, perhaps from ignorance, for the other large island lying between England and Ireland, Man. The ancient name of this latter was probably not unlike that of Mona, but is not accurately known to us (? Monapia, Manavia).

MONACO, a sovereign principality on the Mediterranean coast, 9 m. E. of Nice, bounded on all sides by the French department of Alpes-Maritimes. Pop. (1923) 22,153; area 6 sq. miles.

The Phoenicians, and after them the Greeks, had a temple on the Monaco headland, to Heracles, surnamed by the Greeks Μονοικος, whence the name Monaco. Monoeci Portus, or Portus Herculis, is often mentioned by later Latin writers. In 968 the Genoese Grimaldi family entered into possession and for the most part allied themselves with France until 1524, when Augustin Grimaldi sided with the emperor Charles V. Honoré I., Augustin's successor, was made marquis of Campagna and count of Canosa, and special privileges were granted, including the right to toll from vessels passing the port. Honoré II. (1641) re-allied his house with France, losing Canosa, etc., but becoming duke of the Valentinois. In 1731 Antoine, his great grandson, was succeeded by his daughter, Hippolyte, wife of Jacques Goyon, count of Matignon and Thorigny, who succeeded his wife and took the name of Grimaldi. In 1793 the National Convention dispossessed the reigning family and annexed Monaco to France; the Treaty of Paris (1814) restored the family; that of Vienna (1815) put Monaco under the protection of Sardinia. Mentone and Roccabruna revolted in 1848 and were annexed and occupied by Sardinia till 1859. In 1860 Nice was transferred to France, and in 1861 Monaco passed under French protection, Mentone and Roccabruna being sold to France separately.

In 1911 Prince Albert of Monaco granted the principality a constitution, providing for a national council of 21 members, elected for four years by universal suffrage and *scrutin de liste.* Government is in the hands of a Ministry assisted by a council of State, acting under the authority of the prince; and legislative power rests with the prince and the national council. On June 26, 1922, Prince Louis II. (b. 1870) succeeded his father, Albert, as prince of Monaco.

The territory of Monaco is divided into three communes: Monaco, pop. (1923) 2,020, the old settlement on the summit of a rocky headland defended by ramparts; La Condamine, pop. (1923) 10,705, on the west of the bay, a bathing resort with manufactures of perfume and liqueurs; Monte Carlo, pop. (1923) 9,428, with its casino and its pigeon-shooting ground and many hotels. Each commune is administered by a municipal authority. The judicial system, since 1819, has been based on the French code, there being a court of first instance and a *juge de paix,* and by arrangement, two Paris judges form a court of appeal. Monaco has formed the see of a bishop since 1887. There is a semi-military police force.

The town of Monaco possesses a Romanesque-Byzantine cathedral of St. Nicholas, a mediaeval Genoese and Renaissance palace and Prince Albert's oceanographical museum, opened in 1910. Another museum near the cathedral contains prehistoric exhibits from the Grimaldi grottoes near Mentone and Roman antiquities from La Turbie. La Turbie on the borders of Cisalpine Gaul was the site of the colossal tower of Augustus. The village is reached by a funicular railway from Monte Carlo.

There seem to have been gambling tables at Monte Carlo in 1856, but in 1861 François Blanc of Homburg obtained a concession for 50 years from the prince. This concession passed into the hands of a company, which in 1898 obtained an extension to 1947, paying £400,000 in 1899, £600,000 in 1913, as well as a rent of £50,000 per annum till 1906, £70,000 till 1916, £80,000 till 1926, £90,000 till 1936 and £100,000 till 1947. The inhabitants are forbidden access to the gambling tables, but are exempt from taxation and derive large profits from the visitors. The principality exports olive oil, oranges and perfumes, importing in exchange coal and wine.

See G. Saige, *Monaco, Ses Origines et Son Histoire* (1898); A. Smith, *Monaco and Monte Carlo* (1912).

MONADNOCK, a mass of rock or a hill which, as an erosion remnant, rises above the general peneplain level. Monadnocks

consist usually of some harder rock intrusion or fold which resists weathering and erosion processes. The term is derived from Mount Monadnock in New Hampshire, U.S.A., which represents such a geological structure. The famous Stone Mountain of Georgia is a granite monadnock. The Devil's Tower (*Mato Tepee*) of Wyoming is a volcanic "neck," the hard core of igneous rock having remained after the softer sides have worn away. Monadnocks of the latter type are frequent in the Peak Downs, Queensland, Australia.

MONAGHAN, a county of Ireland in the province of Ulster, bounded east by Armagh, south-east by Louth, south by Meath, south-west by Cavan, west by Fermanagh, and north by Tyrone. Area 319,741 ac., or about 496 sq. miles. Pop. (1926) 65,143. The north-western part is included in the great central plain of Ireland, but to the south and east the surface is irregular. The principal range is that of Slievebeagh, a barren tract extending into Fermanagh, its highest summit being 1,254 feet. The principal rivers are the Finn, rising near the centre of the county and passing into Fermanagh, and the Blackwater, which forms the boundary with Tyrone. The Ulster canal passes the towns of Monaghan and Clones, affording communication between Lough Neagh and Lough Erne. In geological structure the county drops from the Upper Carboniferous outlier of Slievebeagh in the north-west to a Carboniferous Limestone area towards Monaghan town; but south of this a Silurian area stretches across the Cavan and Armagh borders. At Carrickmacross, an outlier of Carboniferous Limestone, Coal Measures (with poor seams of coal) and Trias is encountered. Gypsum has been quarried in the Trias, and lead ore was formerly mined in many places in the Silurian area. The Triassic clay furnishes excellent bricks. Eskers or glacial ridges occur at several places. Limestone is abundant, and worked at small cost. Freestone and slates are quarried.

The district now called the co. Monaghan was included in the district of Uriel or Orgial, known as Macmahon's country. It was made shire ground under its present name by Sir John Perrot in the reign of Elizabeth. At Clones there is a round tower, another at Inishkeen is in ruins. Near Clones are two large raths. There are several Danish forts. The 6th century abbey of Clones, once the seat of a bishopric, was rebuilt in the 14th century.

The soil is generally fertile where it rests on limestone, and there is also a mixed soil of deep clay, capable of high cultivation; but in the hilly regions a strong retentive clay prevails, which could be made productive only by careful draining and culture. Spade husbandry generally prevails. Oats, potatoes and turnips are the principal crops. The number of cattle, sheep, pigs, goats and poultry, is well maintained. Linen is the only manufacture of consequence, but the cultivation of flax has almost died out. The Belfast and Clones line of the Great Northern railway crosses the county from north-east to west, and the Dundalk and Clones line runs from south-east to west, with branches to Carrickmacross and to Cootehill (co. Cavan). Monaghan returns three members to Dáil Eireann.

MONAGHAN, county town of Monaghan, Ireland, on the Ulster canal and the Belfast and Clones line of the Great Northern railway, by which it is 52 m. S.W. by W. of Dublin. Pop. (1921) 4,272. There is a modern Roman Catholic cathedral (1862–92) for the diocese of Clogher. The town takes its name (Muinechan, the town of monks) from an early monastery. It was incorporated by James I., but was little more than a hamlet until the close of the 18th century.

MONAL, MONAUL or IMPEYAN PHEASANT, a beautiful pheasant (*Lophophorus impeyanus*) inhabiting the Himalayan mountains. The cock has a blue and green back with metallic reflections and both sexes bear a crest (*see* PHEASANT). There is an excellent account of this species in C. W. Beebe's *Monograph of the Pheasants.* It is now protected by game-laws in British territory.

MONA MONKEY, a West African guenon (*q.v.*) of the genus *Cercopithecus.* The mona (*C. mona*) is characterized by the presence of a black band running from the eye to the ear. The general colour of the upper parts is black, with a pair of white spots near the tail, while a band across the forehead and the whole under surface are likewise white. (*See* PRIMATES.)

MONARCHIANISM, a theological term designating the view taken by those Christians who, within the Church, towards the end of the 2nd century and during the 3rd, opposed the doctrine of an independent personal subsistence of the Logos, and affirmed the sole deity of God the Father. The representatives of the extreme monotheistic view, which, while regarding Christ as Redeemer, clung tenaciously to the numerical unity of the Deity, were called Monarchians, a term brought into general use by Tertullian. It is usual to speak of two kinds of monarchianism—the dynamistic and the modalistic, though the distinction cannot be carried through without some straining of the texts. (*a*) By monarchians of the former class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely high degree in which he had been filled with Divine wisdom and power. This view was taught at Rome about the end of the 2nd century by Theodotus, who was excommunicated by Bishop Victor, and at a later date by Artemon, excommunicated by Zephyrinus. About the year 260 it was again propounded within the Church by Paul of Samosata (*q.v.*). (*b*) Modalistic monarchianism, conceiving that the whole fullness of the Godhead dwelt in Christ, took exception to the "subordinatianism" of some Church writers, and maintained that the names Father and Son were only different designations of the same subject, the one God, who "with reference to the relations in which He had previously stood to the world is called the Father, but in reference to His appearance in humanity is called the Son." It was first taught, in the interests of the "monarchia" of God, by Praxeas, a confessor from Asia Minor in Rome about 190, and was opposed by Tertullian in his well-known controversial tract. The same view—the "patripassian" as it was also called, because it implied that God the Father had suffered on the cross—obtained fresh support in Rome about 215 from certain disciples of Noetus of Smyrna, who received a modified support from Bishop Callistus. (For the subsequent history of modalistic monarchianism *see* SABELLIUS.)

See the Histories of Dogma by A. Harnack, F. Loofs, R. Seeberg; also articles ADOPTIANISM, ARIANISM.

MONARCHY, strictly, the undivided sovereignty or rule of a single person. (Fr. *monarchie,* from Lat. *monarchia,* from the Gr. μόνος alone, ἀρχή rule.) Hence the term is applied to states in which the supreme authority is vested in a single person, the monarch, who in his own right is the permanent head of the state. The word has, however, outlived this original meaning, and is now used, when used at all, somewhat loosely of states ruled over by hereditary sovereigns, as distinct from republics with elected presidents; or for the "monarchical principle," as opposed to the republican.

The old idea of monarchy, *viz.* that of the prince as representing within the limits of his dominions the monarchy of God over all things, culminated in the 17th century in the extreme version of the doctrine of the divine right of kings, and was defined in the famous dictum of Louis XIV.: *L'état c'est moi!* The conception of monarchy was derived through Christianity from the theocracies of the East; it was the underlying principle of the mediaeval empire and also of the mediaeval papacy, the rule of the popes during the period of its greatest development being sometimes called "the papal monarchy." The monarchical principle was shaken to its foundations by the English revolution of 1688; it was shattered by the French revolution of 1789; and though it survives as a political force, more or less strongly, in many European countries, "monarchists," in the strict sense of the word, are everywhere a small and dwindling minority. To express the change phrases were invented which have come into general use, though involving a certain contradiction in terms *viz.* "limited" or "constitutional monarchy," as opposed to "absolute" or "autocratic monarchy."

Finally, a distinction is drawn between "elective" and "hereditary" monarchies. Of the former class the most conspicuous was the Holy Roman Empire; but in Europe all monarchies were, within certain limits, originally elective; and, after the introduction of Christianity, the essential condition of the assumption

of sovereign power was not so much kinship with the reigning family as the "sacring" by the divine authority of the Church. The purely hereditary principle was of comparatively late growth, the outcome of obvious convenience, exalted under the influence of various forces into a religious or quasi-religious dogma. (*See* also GOVERNMENT and SOVEREIGNTY.)

MONASSIR (MONASIR), tribe of Semitic stock, living in the Nile valley between Birti and Dar Robatab. They are a prosperous, sedentary tribe, claim kinship with the Ababda, and speak Arabic, but are of mixed blood.

MONASTICISM, an ascetic system of living apart from the world (Gr. μοναστής, a monk, from μόνος, alone). Monasticism is the attempt to develop and regulate the exercise of asceticism and mysticism (*qq.v.*). It is by no means a creation of Christianity; long before the Christian era a highly organized monasticism existed in India and other parts of Asia.

A FRANCISCAN NUN

(1). *Pre-Christian Monasticism.*—Greek asceticism and mysticism seem never to have produced a monastic system; but among the Jews, both in Judaea and in Alexandria, this development took place. In Judaea the Essenes before the time of Christ lived a fully organized monastic life (*see* Schürer, *Jewish People*, ii. §30); and the same is true in regard to the Therapeutae in the neighbourhood of Alexandria (the authenticity of Philo's *De Vita contemplativa*, describing their life, is again recognized by scholars).

A general sketch of pre-Christian asceticism and monasticism, with indication of the chief authorities, is given in O. Zöckler's *Askese und Mönchtum* (1897) pp. 32–135. This account is epitomized by J. O. Hannay, *Spirit and Origin of Christian Monasticism* (1903), app. i.: the view now common among scholars is there maintained that these pre-Christian realizations of the monastic idea had no influence on the rise and development of Christian monasticism.

(2). *Beginnings of Christian Monasticism.*—The practice of asceticism asserted itself at an early date in Christian life: men and women abstained from marriage, from flesh meat, from the use of intoxicating drink, and devoted themselves to prayer, religious exercises and works of charity (S. Schiwietz, *Das morgenländische Mönchtum*, 1904, pt. i.; J. O. Hannay, *op. cit.* chs. 2, 3). In Egypt, at the middle of the 3rd century, it was the custom for such ascetics to live in solitary retirement in the neighbourhood of the towns and villages. This was the manner of life which St. Anthony (*q.v.*) began to lead, *c.* 270; but after 15 years he withdrew to a deserted fort on the east bank of the Nile, opposite the Fayum. For 20 years he lived a solitary life until would-be disciples called on him to guide them. There are reasons for doubting whether Anthony was actually the first Christian hermit (*see* E. C. Butler, *Lausiac History of Palladius*, 1898, p. 230), but an isolated case does not invalidate the 4th century tradition that Anthony was the father of Christian monasticism.

(3). *St. Anthony's Monachism.*—The form of monastic life directly derived from St. Anthony was the type that prevailed in middle and northern Egypt up to the middle of the 5th century. The chief authorities for the study of this type of monastic life are the *Vita Antonii* (probably by Athanasius), the *Historia monachorum* (ed. E. Preuschen), the *Historica Lausiaca* of Palladius (ed. E. C. Butler)—these works are to be found in Latin in Rosweyd's *Vitae Patrum* (*Migne, Patrol. Lat.* LXXIII., LXXIV.)—and the writings of Cassian (English translation by Gibson in "Nicene and Post-Nicene Library.")

Antonian monachism grew out of the purely eremitical life, and it retained many of the characteristic features inherited from its origin. The party of travellers whose journey in 394 is narrated in the *Historia monachorum* found at the chief towns along the Nile, from Lycopolis (Assiut or Siut) to Alexandria, and in the deserts that fringed the river, monastic habitations, sometimes of hermits, sometimes of several monks living together.

(4). *St. Pachomius's Monachism.*—Very different was the type of monastic life that prevailed in the more southerly parts of Egypt. Here, at Tabennisi near Dendera, about 315–320, St. Pachomius (*q.v.*) established the first Christian cenobium, or monastery properly so called (*see* P. Ladeuze, *Cénobitisme Pakhomien* (1898); Schiwietz, *op. cit.* pt. ii. §§ 12–16; E. C. Butler, *op. cit.* pt. i. p. 234, pt. ii. notes 48, 49, 54, 59). Before his death in 346 Pachomius had established nine monasteries of men and one of women, and after his death other foundations continued to be made in all parts of Egypt, but especially in the south and in Abyssinia. Palladius tells us that (*c.* 410) the Pachomian or Tabennesiot monks numbered some 7,000. The life was fully cenobitical, regulated in all details by minute rules, and with prayers and meals in common. Work was done for its own sake, not merely for an occupation, thus marking a new departure in the monastic ideal. St. Pachomius not only inaugurated Christian cenobitical life, but he also was responsible for the creation of the first "religious order."

The Coptic abbot Shenout governed on similar lines the great "white monastery," and the ruins still survive near Akhmim. It remained purely Coptic, with no infiltration of Greek ideas or influence (*see* J. Leipoldt, *Schenulte von Atripe*, 1903). Egyptian monachism began to wane after 500, and since the Mohammedan occupation it has ever been declining.

(5). *Oriental Monachism.*—The monastic institute was imported early in the 4th century from Egypt into Syria. The most celebrated was the life of the Stylites or pillar hermits (*see* SIMEON STYLITES). Monastic life here tended to revert to the eremitical form, and to this day Syrian and Armenian monks are to be found dwelling in caverns and desert places, and given up wholly to the practice of austerity and contemplation (*see* E. C. Butler, *Lausiac History of Palladius*, pt. i. p. 239). Before the close of the 4th century monachism spread into Persia, Babylonia and Arabia.

(6). *Basilian and Greek Monachism.*—Though Eustathius of Sebaste was the first to introduce the monastic life within the confines of Greek Christianity in Asia Minor (*c.* 340), it was St. Basil who adapted it to Greek and European ideas and needs (*see* BASILIAN MONKS). St. Basil's standards have remained the standards of Greek and Slavonic monasticism.

(7). *Early Western Monachism.*—The knowledge of the monastic life was carried to western Europe by St. Athanasius, who in 340 went to Rome accompanied by two monks. Monasticism soon became common in Rome and throughout Italy, and before long spread to Gaul and to northern Africa (*see* E. C. Butler, *op. cit.* pt. i. p. 245; also Hannay, *op. cit.* ch. 7).

(8). *St. Benedict's Monachism.*—St. Benedict (*c.* 500) effected a permanently working adaptation of the monastic ideal and life to the conditions of Western races. The life was to be self-denying and hard, but not one of any great austerity (*see* BENEDICT OF NURSIA; and E. C. Butler, *Benedictine Monachism*). The individual monk was sunk in the community, whose corporate life he had to live. St. Benedict's rule was a new creation in monastic history (*see* F. A. Gasquet, *Sketch of Monastic Constitutional History*). St. Benedict defines his monastery as "a school of the service of the Lord" (*Reg., Prol.*). The great act of service is the public common celebration of the canonical office, the "work of God" he calls it, to which "nothing is to be preferred" (*Reg. c.* 43). The rest of the day is filled up with a round of work and reading. Work (and in St. Benedict's time it was predominantly field work) took a more important place in the life than was the case under St. Pachomius or St. Basil, occupying notably more time than the church services. St. Benedict introduced, too, the idea of law and order, of rule binding on the abbot no less than on the monks; thus he reduced almost to a vanishing point the element of arbitrariness found in the earlier rules. Lastly he introduced the idea of stability, whereby monk and community were bound to each other for life.

A BENEDICTINE MONK

THE BENEDICTINE RULE

(9). *Western Monachism in the Early Middle Ages.*—Soon the Benedictine form of monastic life became the only one in Western Europe (*see* Benedictines). The only serious rival was the Irish rule of Columban. The beginnings of Celtic monachism are obscure. When, however, Irish monachism emerges into the full light of history, it was in its manifestations closely akin to the Egyptian, or even to the Syrian type: there was the same love of the eremitical life, the same craving after bodily austerities of an extraordinary kind, the same individualistic piety. The Irish monks were great missioners in the north of England and the northern and central parts of Europe, and in the course of the 7th century the Irish rule of St. Columban and the Roman rule of St. Benedict met in the monasteries in central Europe that had been founded by Columban and his Irish monks. The Benedictine rule supplanted the Irish so inevitably that the personnel ceased to be Irish, that even in St. Columban's own monastery of Luxeuil his rule was no longer observed, and by Charlemagne's time all remembrance of any other monastic rule than the Benedictine had died out. During the 7th and 8th centuries the Benedictine houses were the chief instrument in the christianizing and civilizing and educating of the Teutonic races.

(10). *Offshoots and Modifications of Benedictine Monachism.*—As previously stated, St. Pachomius's monasteries formed an order—a curious anticipation of what six centuries later was to become the vogue in Western monasticism. The Benedictine houses never coalesced in this manner; even when, later on, a system of national congregations was introduced, they were but loose federations of autonomous abbeys; although the convenient expression "Benedictine order" is frequently used, the Benedictines do not form an order in the proper sense of the word. But with the 10th century we reach the period of orders, and it is on this line that all subsequent developments in Western monasticism have run. The first order was that of Cluny, founded in 910 (*see* Cluny).

The chief offshoot from the Benedictine institute was the Cistercians (*c.* 1100); their ground idea was to return to the letter of St. Benedict's rule (*see* Cistercians).

Towards the end of the 10th century and during the 11th a strong tendency set in to revert to the eremitical life, probably owing to the example of the Greek monks, who at this time entered Sicily and south Italy in great numbers. This tendency produced the orders of the Camaldulians or Camaldolese (*c.* 975) in Italy, and in France the Grandmontines (1076) and Carthusians (1084), all leading practically eremitical lives, and assembling ordinarily only for the church services. The Vallombrosians (1038) near Florence maintained a cenobitical life, but eliminated every element of Benedictine life that was not devoted to pure contemplation. At Fontevrault (founded in 1095) the special feature was the system of "double monasteries" *i.e.,* neighbouring, but rigorously separated, monasteries of men and of women.

(11). *New Kinds of Religious Orders.*—A new form was that of the canons regular or Augustinian canons (*q.v.*) who about the year 1060 arose out of the older semi-monastic canonical institute, and lived according to the so-called "Rule of St. Augustine." The essential difference between monks and regular canons may be explained as follows: monks, whether hermits or cenobites, are men who live a certain kind of life for its own sake; external works, either temporal or spiritual, are accidental. But canons regular were in virtue of their origin essentially clerics, and their common life, monastery rule, and the rest, were something additional grafted on to their proper clerical state.

Two special kinds of orders arose out of the religious wars waged by Christendom against the Mohammedans in the Holy Land and in Spain: (1) the military orders: the Knights Hospitallers of St. John and the Knights Templars, both at the beginning of the 12th century, and the Teutonic Knights at its close; (2) the orders of Ransom, whose object was to free Christian prisoners and slaves from captivity under the Mohammedans, the members being bound by vow even to offer themselves in exchange; such orders were the Trinitarians (*q.v.*) founded in 1198, and the order of Our Lady of Ransom (de Mercede), founded by St. Peter Nolasco in 1223; both were under the Augustinian rule.

RISE OF MENDICANT ORDERS

At the beginning of the 13th century arose the series of great mendicant orders. Their nature and work and the needs that called them into being are explained in the article Mendicant Movement, and in the separate articles on St. Francis of Assisi and Franciscans (1210), St. Dominic and Dominicans (1215), Carmelites (1245) Augustinian Hermits (1256)—these were the four great orders of mendicant friars—to them were added, in 1487, the Servites (*q.v.*) founded in 1233. Among monks and canons regular each monastery has its fixed community. The friar, however, does not belong to any particular house, but to the province or order. In the monk attachment to his own monastery is a virtue; in the friar detachment is the ideal. The monk, or the canon, normally exercises his influence on the world in and through his community, not as an individual but as a member of a corporate body. The friar's sphere of work is normally outside his convent, and he works and influences directly and as an individual. Here too should be mentioned St. Francis's great creation, the Tertiaries (*q.v.*) or devout men and women living in the world, who while continuing their family life and their ordinary avocations, followed a certain rule of life, giving themselves up to more than ordinary prayer and the pursuit of good works, and abstaining from amusements of a worldly kind.

(12). *The Religious Orders in the Later Middle Ages.*—The 13th century was the heyday of monasticism in the West; the mendicant orders were in their first fervour and enthusiasm and the great abbeys of Benedictines, Cistercians and Augustinian canons reflected the results of the religious reform and revival associated with Hildebrand's name. Under the Benedictine rule were formed the new congregations or orders of Silvestrines (1231), Celestines (*c.* 1260) and Olivetans (1319; *qq.v.*). But towards the end of the century a period of decline set in, which ran its course in increasing volume throughout the 14th century. A great wave of secularity rolled over the Church, engulfing the religious orders with the rest. The great schism was reflected in the mendicant orders which were divided into two obediences, to the destruction of discipline. The great wealth of the old monastic orders exposed them, especially in France and Italy, to the vicious system of commendation, whereby a bishop, an ecclesiastic, or even a layman was appointed "commendatory abbot" of a monastery, merely for the purpose of drawing the revenues (*see* Abbot); the monasteries were often deprived even of necessary maintenance, the communities dwindled, and regular observance became impossible. In the German lands, the lowest level was touched, and the writings of the Augustinian canon Johann Busch and of the Benedictine abbot Trithemius reveal a state of things in the first half of the 15th century that urgently called for reform. The first move in this direction was made in the Netherlands and north Germany under the influence of Gerhard Groot (*q.v.*) and issued in the formation of the Windesheim congregation of Augustinian canons and the secular congregation of Brothers of Common Life (*q.v.*) founded *c.* 1384, both of which became centres of religious revival. During the first half of the 15th century numerous and effective efforts at reform were initiated in all the orders without exception, and in every part of Europe. These movements, promoted by the councils of Constance and Basle, partook of the spirit of the time and were characterized by an extreme austerity of life, a certain hardness of spirit, and a sort of police regulation easily understandable at a time of reaction from grave abuses. At this time arose the Hieronymites (*q.v.*) founded in 1375, under the Augustinian rule, the Observants (1415) among the Franciscans (*q.v.*), and the Minims (founded *c.* 1460 by St. Francis of Paola, *q.v.*), whose programme was to outdo the Minors or Franciscans. The Refor-

BY COURTESY OF THE BRITISH MUSEUM (PRINT ROOM)

A DOMINICAN NUN, THIRD ORDER OF ST. DOMINIC

mation destroyed the monasteries in northern Europe and crippled those in central Europe. But a tide of reaction soon began to flow.

MODERN TIMES

(13). *The Modern Orders.*—During the Reformation period there sprang up to meet the needs of the time, a new kind of religious order, called Regular Clerks. These are religious orders in the full sense of the word, as the members take the solemn religious vows. Regular clerks are by their institute clerics and priests, and they are devoted to some particular work or works as their own special object—as education, the preaching of missions and retreats, or the going on missions to the heathen. They carry still further the tendencies that differentiate the friars from the monks; and have commonly given up the choral celebrations of the canonical office, which had been maintained by the friars.

Of regular clerks by far the most important are the Jesuits (*q.v.*) founded in 1540; there are also the Theatines (founded 1524 by St. Cajetan and Caraffa, afterwards Paul IV.); the Barnabites (founded 1530, by St. Antonio Zaccaria) and others (*see* Max Heimbucher, *Orden u. Kongregationen* [1897] II., §§108–114). Strictly speaking the "religious congregations" should be distinguished from the orders of regular clerks, the difference being that in the former the vows, though taken for life, are only "simple vows" and more easily dispensable by authority; but the character and work of the two institutes is very similar. The chief of these congregations are the Passionists (founded by St. John of the Cross, 1725) and the Redemptorists (founded by St. Alfonsus Liguori, 1749), both dedicated to giving missions and retreats. The Christian Brothers, devoted to primary education, founded by St. Jean Baptiste de la Salle in 1679, are not in orders (Heimbucher, *op. cit.* §§115–118).

Besides the religious congregations there are a number of "secular congregations," composed of secular priests living together under temporary vows and free to leave at will; the following deserve mention: Oblates of St. Charles (founded by St. Charles Borromeo, 1578); Oratorians (founded by St. Philip Neri, *c.* 1570); the French Oratory (founded by Cardinal Berulle, 1613), a similar but distinct institution, which produced a number of scholars of the highest distinction—Thomassin, Morin, Malebranche, Richard Simon, Juénin, Lebrun, Masillon, and others; Lazarists (founded by St. Vincent de Paul, 1624); Sulpicians (founded by M. Olier, 1642), and a vast number of others, including several for the mission to the heathen (*see* Heimbucher *op. cit.* §§124–140).

During the period under review, from the Reformation to the French Revolution, the old orders went on alongside the new, and many notable revivals and congregations arose among them: the most noteworthy were the Capuchins (*q.v.*) among the Franciscans (1528); the Discalced Carmelites (*q.v.*) of St. Teresa and St. John of the Cross (1562); the Trappists (*q.v.*) among the Cistercians (1663); and most famous of all, the Maurists (*q.v.*) among the Benedictines of France (1621).

(14). *The Religious Orders in Recent Times.*—At the end of the 18th century and the opening of the 19th the religious orders received a succession of blows in those countries in which they had survived the Reformation. The Jesuits were suppressed by Pope Clement XIV. in 1773, and restored by Pius VII. in 1814. As the result of the ecclesiastical policy of the emperor Joseph II. nearly all religious houses of all kinds were suppressed throughout the Austrian dominions (1780). The French Revolution swept them out of France and caused the secularization of the great majority in Central Europe and Italy. In Portugal and Spain they were dissolved in 1834–35; in Italy in 1866; in the Prussian dominions in 1871. The last half of the 19th century, and more especially the last quarter, witnessed a remarkable revival of vitality and growth in most of the older orders in nearly every country of western Europe, and besides an extraordinary number of new congregations, devoted to works of every sort, were founded in the 19th century: Heimbucher (*op. cit.* §§118, 134–140) numbers no fewer than 70 of these new congregations of men. In the new countries especially in the United States and Australia, but also in South Africa, orders and congregations of all kinds are most thriving. The chief set-back has come again in France, where, by the Association Laws of 1903, the religious orders have nearly all been suppressed and expelled and their property confiscated. Many religious returned to France after the World War.

WOMEN'S PART

(15). *The Nuns.*—In all ages women, hardly less than men, have played their part in monasticism. In the earliest Christian times the veiled virgins formed a grade or order apart, more formally separated from the community than were the male ascetics. There is reason for believing that there were organized convents for women before there were any for men; for when St. Anthony left the world in 270 to embrace the ascetic life, the *Vita* says he placed his sister in a nunnery (παρθενών). We learn from Palladius that by the end of the 4th century nunneries were numerous all over Egypt, and they existed also in Palestine, in Italy and in Africa—in fact throughout the Christian world. It is a curious coincidence that the sister of each of the three great cenobitical founders, Pachomius, Basil and Benedict, was a nun and ruled a community of nuns according to an adaptation of her brother's rule for monks. In the West the Benedictine nuns played a great part in the Christian settlement of north-western Europe. As the various monastic and mendicant orders arose, a female branch was in most cases formed alongside of the order; and so we find the canonesses, and hermitesses and Dominicanesses, and Franciscan nuns, or Clares (*q.v.*). Then there were the "double orders" of Sempringham (*see* GILBERT OF,) and Fontevrault, in which the nuns were the predominant, or even the dominant, element. Of the modern orders of men only a few include nuns. The great majority of these modern congregations of women follow the Augustinian rule, supplemented by special constitutions or by-laws; such are the Brigittines, the Ursulines and the Visitation nuns: others follow the rule of the third order of the Franciscans or other mendicants (*see* TERTIARIES). In early times nuns could go out of their enclosure on occasion; but in the later middle ages, up to the Council of Trent, the tendency was to keep them more and more strictly confined within their convent precincts. In 1609 an English lady, Mary Ward, founded at Munich the "Institute of Mary," the nuns of which were not bound to enclosure. St. Vincent de Paul soon followed; in 1633 he established the Sisters of Charity, bound only by yearly vows, and wholly given up to works of charity—chiefly nursing in hospitals and in the homes of the poor, and primary education in poor schools. The nuns belonging to the older orders tend to the contemplative idea, and they still find recruits in sufficient numbers, in spite of the modern rush to the active congregations. These latter exist in wondrous number and variety, exercising every imaginable form of good work—education, both primary and secondary; the care of hospitals, orphanages, penitentiaries, prisons; of asylums for the blind, the deaf and dumb, the insane; of refuges for the aged poor and the destitute.

A MONK OF THE CARTHUSIAN ORDER

For monasticism generally *see* Helyot, *Histoire des ordres réligieux* (1714, 2nd ed. 1792); Max Heimbucher, *Orden und Kongregationen*, 2nd ed. 1907, 3 vols. (good bibliography); Leclerc, art. "Cénobitisme" in *Dictionnaire d'Archéologie et de Liturgie;* and for first 10 sections, E. C. Butler, *Benedictine Monachism. See* also the works named at the end of the various articles referred to in the text.

MONASTIR, one of the largest cities in S. Serbia, Yugoslavia (Serbian *Bitolj*). Pop. (1921), 28,418, comprising Serbs, Mohammedan Slavs, Albanians, Turks, Bulgarians, Vlachs, Greeks and the largest Jewish colony in Serbia. Each of these has its own district and conducts its own national and religious propaganda. The town is situated on an upland plain 2,019 ft. above sea-level, at the mouth of a ravine, and with richly wooded mountains to the east. Monastir is unfortified, but is of military value both because the fertile plain affords a good base for supplies and because many roads converge upon it. A river traverses the town,

with quays and promenades, but the streets are badly made, and the houses, though solidly built, are mostly only of one story. There are several large public buildings and a school. The chief industries are rubber, tanning, the manufacture of ribbons, stockings and carpets, and before the World War (1914–18) silver filigree work, the output of which is now much lessened. The plain affords excellent pasturage for cattle, and wheat, maize, tobacco, madder and the poppy are cultivated. The town is famous for its fairs, and serves as a distributing centre for S.W. Serbia, carrying on an active trade in grain, flour, cloth, hides and bones. The military advantages of its position led the Turks, about 1820, to make it the headquarters of an Army corps, which greatly increased its general and commercial importance. In 1898 it was made the see of a Bulgarian bishop. The ancient diocese of its Greek archbishop is known as Pelagonia from the old name of the Kara-Su or Tzerna plain. Monastir itself has been identified with the ancient *Heraclea Lyncestis* on the Via Egnatia. In the Balkan Wars (1912–13) Monastir was taken from the Turks by the Serbs and assigned to Serbia by the Treaty of Bucharest (1913).

MONAZITE, a mineral consisting of phosphate of the cerium metals, the formula being $(Ce,La,Di)PO_4$; small and variable amounts of thorium (ThO_2, 1–10%) and yttrium are usually also present. It is of considerable commercial importance as a source of thoria for the manufacture of mantles for incandescent gas-lighting; the cerium is used to a limited extent in pharmacy, and alloyed with iron it forms the "flints" (sparking metal) of automatic lighters.

Crystals of monazite belong to the monoclinic system, and are usually flattened parallel to the ortho-pinacoid. The large (up to 5in. in length) reddish-brown, dull and opaque crystals from Norway and the Urals are simple in form, whilst the small, translucent, honey-yellow crystals from the Alps are bounded by numerous bright faces. The hardness is 5½, and the specific gravity 5·1–5·2. Light which has traversed a crystal or grain of monazite exhibits a characteristic absorption spectrum, and this affords a ready means of detecting the mineral.

As minute crystals monazite is of wide distribution in granites and gneisses, being present in very small amounts as an accessory constituent of these rocks. By powdering the rock and washing away the lighter minerals in a stream of water the heavy minerals (zircon, anatase, rutile, magnetite, garnet, monazite, xenotime, etc.) may be collected. This separation has been effected naturally by the weathering and disintegration of the rocks and the accumulation of the heavier minerals in the beds of streams. Under these conditions monazite has been found as rounded water-worn grains in the alluvial gold-washings of the Urals, Finland, Siberia, the United States, Brazil, Colombia, New South Wales, etc. Larger crystals of monazite are found embedded in pegmatite veins in the Ilmen mountains (southern Urals); at Arendal and other places in southern Norway, where it is collected in the felspar quarries to the extent of about one ton per annum; and in the mica mines at Villeneuve, Quebec, where masses of monazite weighing 20lb. have been found.

The deposits worked commercially are the monazite-bearing sands of North Carolina, Brazil, Ceylon and Travancore. In Brazil it occurs in river-gravels and also in the sand on the sea-beaches; an extensive accumulation of very rich monazite sand occurs on the seashore near Alcobaça in Bahia, and this has been shipped as ballast in the natural state. In Travancore the sands of the sea-shore and of the sand-dunes along the coast are concentrated by washing, and the grains of monazite are separated electro-magnetically from the associated zircon and ilmenite.

See "Monazite," Imp. Mineral Resources Bureau (London, 1920).

MONBODDO, JAMES BURNETT, Lord (1714–1799), Scottish judge and anthropologist, born at Monboddo, Kincardineshire, studied at Aberdeen and Edinburgh. He was made a lord of session in 1767 with the title of Lord Monboddo. In his *Antient Metaphysics* (1779–99), Monboddo conceived man as gradually elevating himself from an animal condition, in which his mind is immersed in matter, to a state in which mind acts independently of body. In his equally voluminous work, *The Origin and Progress of Language* (1773), he brought man under the same species as the orang-outang. He traced the gradual elevation of man to the social state, which he conceived as a natural process determined by "the necessities of human life." He looked on language (which is not "natural" to man in the sense of being necessary to his self-preservation) as a consequence of his social state. His views about the origin of society and language and the faculties by which man is distinguished from the brutes have many curious points of contact with Darwinism and neo-Kantianism. He died on May 26, 1799.

Boswell's *Life of Johnson* gives an account of Johnson's visit to Burnett at Monboddo, and is full of references to the natural contemporary view of a man who thought that the human race could be descended from monkeys.

MONCEY, BON ADRIEN JEANNOT DE, Duke of Conegliano (1754–1842), marshal of France, the son of a lawyer, was born at Besançon on July 31, 1754. He received a commission in the army in 1778. Moncey won great distinction in the campaigns of 1793 and 1794 on the Spanish frontier (*see* French Revolutionary Wars), rising in a few months to the command in chief of the Army of the Western Pyrénées. After this he was employed in the highest commands until 1799, when the government, suspecting him of Royalist views, dismissed him. But the *coup d'état* of the 18th Brumaire brought him back to the active list, and in Napoleon's Italian campaign of 1800 he led a corps from Switzerland into Italy. In 1801 Napoleon made him inspector-general of gendarmerie, created him a marshal of France in 1804, and in 1808 he received the title of duke of Conegliano. In 1808 Moncey was sent to Spain in command of an army corps. He took a leading part in the emperor's campaign on the Ebro and in the second siege of Saragossa in 1809. He refused to serve in the invasion of Russia. When, however, France was invaded (1814) Marshal Moncey reappeared in the field and fought the last battle for Paris. He remained neutral during the Hundred Days, but after Waterloo he was imprisoned, for refusing to take part in the court-martial on Ney, and lost his marshalate. He was reinstated in 1816. His last active service was as commander of an army corps in the short war with Spain, 1823. He died on April 20, 1842.

MONCTON, a city and port in Westmoreland county, New Brunswick, Canada, 89 m. by rail N.E. of St. John, at the head of navigation on the Petitcodiac river, the seat of the workshops and general offices of the Canadian National railway. Pop. (1931) 20,689. It has large stove factories, engine and boiler works, and an extensive lumber trade.

MOND, LUDWIG (1839–1909), British chemist, was born at Cassel in Germany on Mar. 7, 1839. After studying at Marburg under Hermann Kolbe and at Heidelberg under Robert Bunsen, he came to England in 1862 and entered into partnership with Mr. Hutchinson, a well-known alkali manufacturer at Widnes, where he elaborated the practical application of a method he had patented for recovering the sulphur lost as calcium sulphide in the black ash waste of the Leblanc alkali process, which he introduced into some 30 works in England and France. He became a naturalized British subject in 1867. In 1873 he entered into partnership with Sir John Tomlinson Brunner (1842–1919), who was employed in the office of Mr. Hutchinson, and thus founded the great chemical manufacturing firm of Brunner, Mond and Co. They began to make alkali by the ammonia-soda process, under license from the Belgian chemist Ernest Solvay. This process had previously been a failure in all the works it had been experimented on, but Mond gradually conquered the technical difficulties, largely as a result of his inventing and employing strictly scientific methods of controlling the reaction involving the recovery of the ammonia and the other products. About 1879 he began experiments in the economical utilization of fuel and his efforts led him to the system of making producer-gas known by his name (*see* Gas). In connection with this he worked out a gas battery. Whilst developing the production of chlorine products from the ammonium-chloride obtained in the ammonia-soda reactions, he noticed that the nickel valves used for the control of the gases were acted upon by carbon monoxides. A study of the formation of the nickel carbide led to the discovery of nickel

carbonyl. The conditions of its formation made possible a successful process for the extraction of nickel from its ores, which involved both the finding, acquisition and development of mines in Canada, the elaboration of new and suitable smelting operations there and the invention of highly specialized apparatus for the refining works in Wales. A liberal contributor to the purposes of research, Mond founded in 1896 the Davy-Faraday Research laboratory in connection with the Royal Institution, and contributed to the International Catalogue of Scientific Literature, to the erection of laboratories and to research at many universities in England (London, Liverpool, Manchester). He died in London on Dec. 11, 1909.

MONDAY, the second day of the week (*see* CALENDAR). The word is derived from O.E. *Monandaeg* (Lat. *Lunae dies*, French *lundi*). The day has been humorously canonized as St. Monday, the festival of cobblers, who seldom work on Mondays, and were supposed not to know on which day the feast of St. Crispin, their patron saint fell, save that it should be a Monday, and thus celebrated every Monday. Collop Monday, in the north of England, is the Monday before Shrove Tuesday, so called in allusion to the dish of collops, taken preparatory to the Lenten fast. Plough Monday in England is the first Monday after Epiphany, when in mediaeval times the ploughmen had their fête-day. The lord mayor of London holds a Grand Court of Wardmote at the Guildhall on Plough Monday when the election of common councilmen is announced.

MONDOÑEDO, a city of northern Spain, in the province of Lugo, 27 m. N.N.E. of the city of Lugo, on the river Masma. Pop. (1920) 9,462. Mondoñedo occupies a sheltered valley among the northern outliers of the Cantabrian mountains. According to local tradition, the bishopric of Dumium, near Braga, was transferred to San Martin de Mondoñedo (10 m. from Mondoñedo) in the 8th century; it was brought to Mondoñedo itself in the beginning of the 12th century. The principal buildings are the cathedral, a Corinthian structure of the 17th century and an ex-convent of Franciscan friars of Alcantara. The industries include lace-making, linen-weaving and leather manufacture.

MONDOVÌ, a town and episcopal see of the province of Cuneo, Piedmont, Italy, 17 m. E. of Cuneo by rail. Pop. (1921), 12,375 (town); 20,030 (commune). The lower town is 1,283 ft. above sea-level, the upper 1,834 feet. At the foot of the hill lie the industrial and commercial suburbs with potteries, etc. About 2 m. to the east is the sanctuary of Vico, a church designed by Ascanio Vittozzi in 1596 and crowned by a famous dome (1730–48).

See L. Melano Rossi, *The Santuario of the Madonna di Vico* (London, 1907).

MONEL METAL, the trade-marked name of a copper-nickel alloy developed in 1905. The alloy contains about 69% nickel, 28% copper, 2% iron, together with small amounts of carbon, manganese and silicon, and is made directly from the copper-nickel ores of Sudbury, Ont., Canada, by roasting the copper-nickel converter matte (*see* NICKEL) and reducing the resulting oxide to metal with charcoal.

The alloy is nickel white in colour and its distinguishing characteristics are its rust-proofness and corrosion-resistance, its ready manufacture by all usual methods and its satisfactory mechanical properties. Its corrosion rate is low in moist atmosphere, fresh and sea-water, solutions of most organic salts, alkalis, and of all except nitric and other strongly oxidizing acids. Very corrosive solutions, such as those of ferric salts, of sulphurous acid, of the free halogens, attack it appreciably. The alloy is quite malleable, both hot and cold, and machinable. It is readily melted and cast. It can be forged, rolled, machined, drawn and welded and in consequence is readily fabricated and is available in a wide variety of commercial forms. Some of the most important characteristics of monel metal are: density, 8·80; melting range (about), 1,345-1,375° C; modulus of elasticity, 25,000,000 lb. per sq.in.; tensile strength (hot-rolled), 90,000 lb. per sq.in.; tensile strength (cold-rolled), 100,000 to 150,000 lb. per sq.in.; elongation (hot-rolled), 50%; Brinell hardness (hot-rolled), 150; thermal expansion (25–100° C), ·000014 per 1° C; electrical resistivity, 42·5 microhms per c.c.; magnetic permeability (100 Gauss), 10–15; forging and rolling temperature range, 940–1,240° C.

MONESSEN, a city of Westmoreland county, Pennsylvania, U.S.A., on the Monongahela river, 30 m. S. of Pittsburgh; served by the Pittsburgh and Lake Erie and (through West Monessen and Charleroi, across the river) the Pennsylvania railroads. Pop. (1920) 18,179 (35% foreign-born white); and was 20,268 Federal census 1930. It is an important and rapidly growing unit of the Pittsburgh industrial district, with a factory output (chiefly steel, tin plate, and wire fence) valued in 1925 at $49,092,211. The borough was settled and incorporated in 1897 and was chartered as a city in 1921. The name was formed by prefixing the first syllable of Monongahela to the name of the German steel centre.

MONET, CLAUDE (1840–1926), French painter, was born in Paris on Nov. 14, 1840. He was one of the chief founders of the Impressionist school. At Hâvre he became acquainted with Boudin, under whose guidance he learned to love and to understand nature. At the age of twenty he became a soldier, and spent two years of his military service with the regiment of the Chasseurs d'Afrique in the desert. Falling ill with fever, he was sent home, and entered the studio of Gleyre, who tried in vain to keep him to academic art. Monet left his studio, where he had become acquainted with Sisley and Renoir. At that time he also knew Manet, and in 1869 he joined the group of Cézanne, Degas, Duranty, Sisley, and became a *plein air* painter. During the war of 1870 he withdrew to England, and on his return was introduced by Daubigny to a dealer, M. Durand-Ruel, in whose galleries almost all his works have been exhibited. In 1872 he exhibited views of Argenteuil, near Paris; in 1874 a series entitled "Cathedrals," showing the cathedral of Rouen under different lights. Some time later he painted views of Vétheuil (1875) Pourville and cliffs of Etretat (1881), of Bordighera (1886), of the Creuse (1889), Le Meules (1891) and some further views of cathedrals (1894). In December 1900 he exhibited some pictures called "Le Bassin aux Nymphéas," and was engaged at the beginning of 1901 in painting views of London.

In his later years he worked in the neighbourhood of Giverny, where he lived, and devoted himself to the study of motifications in the aspect of a limited number of subjects caused by changes of light and the seasons. On the motive of the "Bassin aux Nymphéas" he produced a series of twelve large compositions. Another series painted in 1913 is the "Arceaux Fleurs" representing a corner of his garden. In 1918 he produced similar studies under the title "Saule Pleureur." He died at Giverny on Dec. 5, 1926.

See Gustave Geffroy, *Claude Monet* (1922); and IMPRESSIONISM.

MONETARY UNION. An agreement between two or more countries, whereby the national currency of each contains an equal amount of gold and silver, so that the mint par of exchange between them is in the ratio of one to one, and the coins of each country adhering to the union can, by custom if not by law, circulate freely in all the countries, parties to the agreement.

The outstanding example of this is the Latin Monetary Union, founded in 1863 and embracing France, Belgium, Switzerland, Italy and later Greece. Each country kept its own nomenclature for its currency, France, Belgium and Switzerland terming their monetary unit the franc, Italy the lira, and Greece the drachma. The important point was that, by the laws of each country, 3,100 of these units must be coined from a kilogramme of gold, ·835 fine, and 200 from a kilogramme of silver. It may be added that all members of the union originally recognized the double standard of gold and silver, in the ratio of 3,100 : 200 or $15\frac{1}{2}$: 1. Based on the gold standard, the par of exchange with England is Frs. 25·2215 equal to one pound sterling. It was only in 1873 that, owing to the depreciation of silver, all the members of the union agreed to limit the coinage of new silver five-franc pieces, and by thus putting an end to the "free coinage" of silver, placed their common currency virtually upon the gold standard. Henceforward, the double standard was known as the "limping standard," in recognition of the fact that silver had been divorced from an equal position to gold.

Certain other countries, although not members of the Union,

employed as their unit of currency a coin equivalent to the franc or lira. Among these were Spain (the peseta), Serbia (the dinar), Bulgaria (the leva), and Rumania (the leu). All these were equal to a franc, lira or drachma at the mint par of exchange.

The other important monetary union was the Scandinavian Union, comprising Sweden, Norway and Denmark. Here the national monetary units even had a common name, the krone. The Scandinavian Union was formed between Sweden and Denmark in 1873, and Norway joined two years later. Kr. 18·159 equal one pound sterling.

The World War broke up both unions. Bank-notes and currency notes were never recognized as currency within the terms of the union, and were never legal tender beyond the frontiers of the issuing country. Currency inflation and restrictions on the import and export of coin and notes, gold and silver, put an end to monetary unions in fact, if not in name, and even when, in recent years, stabilization and revaluation of depreciated currencies has proved practicable, each country has fixed the stabilization point at the level most convenient to itself, regardless of its former associates in the union. Thus the old mint par of exchange of the franc, lira and drachma against sterling was Frs. 25·2215 to the pound. When Belgium stabilized in 1926, the new par was fixed at 35 belgas to the pound. The belga was a new unit, in its turn equivalent by law to five francs, so this means a new par of Frs. 175 to the pound. A year later, Italy was able to stabilize, and she selected the ratio of 366 new lire to 100 old gold lire, thus making the new mint parity 92·46 lire to the pound. The Swiss franc never depreciated, and parity has been kept at Frs. 25·22 to the pound. Finally, in 1926, France stabilized her franc "de facto" at 124 francs to the pound, while in early 1929 the drachma was quoted at 375 to the pound.

Although members of the Scandinavian Union also suffered from inflation, the attacks of the disease were not unduly severe, and recovery proved practicable. The Swedish crown returned to a gold basis in 1924, the first of all European currencies, and a few years later heroic efforts brought the Norwegian and Danish crowns nearly back to par, Norway actually returning to gold in April, 1928. The post-war period also introduced a fourth member, the Estonian kroon. (N. E. C.)

MONETT, a city of Barry county, Missouri, U.S.A., in the Ozark region of the south-western part of the State; a division point on the Frisco railway lines. Pop. (1920) 4,206 and 4,099 in 1930. It is an important shipping point for fruit, especially strawberries, of which 202 carloads were sent out in 1928. The city was founded in 1887 and incorporated in 1888.

MONEY. The word "Money" is believed to be derived from *Moneta,* an attribute of the Roman goddess Juno, because the ancient Roman Mint was established in the Temple of Juno Moneta. It is possible however that the goddess's attribute Moneta was itself derived from the use of the Temple as a Mint.

Money is often described as a *medium of exchange.* If a man exchanges his labour for money, and exchanges the money for food, he is in effect exchanging his labour for food. The money intervenes as a means or medium, received only to be parted with; the end is the food.

Price.—The exchanges in which money is or may be used as a medium are of a certain definite type; they are exchanges organized through markets. In order to arrive at a more precise conception of money, it is essential to make clear what this means. We can imagine casual and isolated exchanges being effected in a primitive state of society. A man exchanges a cow for an ornament. He prefers the ornament to the cow and his neighbour prefers the cow to the ornament, and these preferences are themselves sufficient to bring the exchange about. In a market, however, exchanges are not isolated. The market is so organized that any one contemplating an exchange can compare the things which different people are willing to give for what he has to dispose of, and can select the most favourable offer. He will not exchange an ornament for a cow if he knows that someone else will offer a cow and two sheep. But suppose someone else offers twelve sheep or a carpet, how is he to decide among them all? What is needed is some common basis of comparison of the offers. A solution is to be found in the selection of *one* of the products dealt in, to be used as a medium of exchange. If all the different things are exchanged in the market for specified quantities of this medium, the desired comparison becomes possible. For any particular product no one will offer more or accept less of the medium than his neighbours. The market equalises the terms on which, at any one time and place, all the exchanges are made. In a market so organized every product has its price, the quantity of the established medium for which it will exchange. The price is a definite quantity at a given time and place because, in virtue of the equalizing effect of the market, similar things do not exchange for different quantities of the medium. The comparison of exchanges is a comparison of prices. At the time the comparison is made, the prices are those involved in hypothetical exchanges. Once an exchange has been concluded, it ceases to play a part in the competition of the market; it is no longer available as an alternative.

To quote a price is to make an offer. Acceptance of the offer creates an obligation on the seller's part to deliver the goods to the buyer. On the other side it creates a debt from the buyer to the seller. The debt is discharged by the delivery of money. Thus the market is composed at any time of a number of competing offers of goods at a price, or alternatively of a number of competing bids for goods at a price. Money, the medium of exchange, supplies the unit in which price is reckoned, the measure of value. Money is the means appointed for the payment of debts.

Characteristics Required of Money.—What then are the qualities required of a commodity used as money, if it is to fulfil this function well and efficiently? (1) In the first place it must be the kind of thing that can be specified. If a price is to be quoted in the form of a stated number or quantity, the things used as money must be so uniform or so perfectly graded that they can be counted or measured without individual scrutiny. (2) If things of small value are to be dealt in, in the market, and if small differences of value are to be distinguished, money must be capable of a sufficient degree of subdivision. If cattle were the only money, nothing worth less than a whole cow or ox could be bought or sold, and bargains would have to raise or lower prices by a whole cow or ox at a time. (3) Money is brought to market by every one. It is not like other kinds of merchandise, which are dealt in by specialists who are expected to know all about the stuff they sell. Money should be something easily recognized by everyone and distinguishable from imitations. (4) People carry money to and from the places at which they buy and sell. It should therefore be portable. (5) Those who sell may want to keep the proceeds in the form of money for some time before they have occasion to buy. Money should therefore be something durable, not readily subject to destruction or decay.

All these different qualities were eventually found, after long and varied experience, to be best combined in the two precious metals, gold and silver.

Paper money consists of notes, each made legal tender for a specified amount (denomination) of the money of account, and printed on water-marked paper in such a manner as to make forgery as difficult and unlikely as possible. These notes are mere tokens or tickets, entitling the bearer to pay debts to the amount of their several denominations. They can be issued in high denominations for which coins would be inconveniently big, or in low denominations for which coins would be inconveniently small. (*See* MINT.)

Measurement of Value.—The monetary unit is the common denominator of all market values (prices). So long as it is equated to a prescribed weight of a commodity, such as gold or silver, the measurement of values is a clear enough process. Gold and silver themselves are dealt in on the market, and prices of other commodities simply represent the terms on which they exchange in the market for gold or silver. Paper money itself may be so regulated that the monetary unit is the equivalent of a fixed quantity of gold or silver. For example it may be made convertible, on demand, into coin. In general, countries using paper money have endeavoured to maintain convertibility into metal, and when they have lapsed from it have aimed at re-establishing it. A metallic standard is the universally accepted monetary

policy. Departures from it occur only at times of emergency and transition. Nevertheless such departures do occur, and some times years, and even generations pass before the theoretically normal standard is restored. In such conditions, when the monetary unit is represented by nothing more solid than paper money, what is the significance of a price? In terms of what does the price measure value? This question is fundamental in the theory of money. If all the exchanges in the markets could be settled from day to day, and no debts of any kind remained outstanding till the next morning, the absolute value of the unit would be a matter of no practical consequence. Prices would do all that is required of them by representing the proportions holding among exchangeable values. But in real life not only are debts left outstanding and balances of money kept in hand for indefinitely varying intervals, but pecuniary rights and interests extending over long periods are constantly being created and dealt in. Mortgages, the bonds, debentures and preference shares of companies, the debts of public authorities, national and local, are examples.

Every creditor and every holder of money is concerned in the value of the unit in which money and debts are reckoned. Essentially the unit represents purchasing power. What the creditor possesses is a power of access to markets, where everything is offered at a price. His power over any one product is measured by the inverse of its price. If he wants to buy bread, the greater the price of bread, the less is the purchasing power of a given sum of money in terms of bread. But a creditor does not limit his wants to any one product. He will need to buy a selection from among all the products on sale, and his purchasing power ought to be measured in relation to the prices of this selection. We need to estimate what may be called the "wealth-value" of the monetary unit, its purchasing power in terms of wealth in general. This is a problem admitting of no exact or theoretically perfect solution. The prices of different products are constantly varying in relation to one another, and no possible selection of products can be perfectly typical at all times and places.

What we can do, however, is to construct what is called an index number of prices. In order to compare the value of the monetary units at two different times, we compile a list of products dealt in in the markets at both times, and we express for each product the price at one time as a ratio of the price at the other time. We then take an average of these ratios. For example, if there were five products, and their prices had increased respectively by 2, 4, 6, 8 and 10 per cent, the average increase would be 6 per cent. That means that the purchasing power of the unit in terms of these five products has fallen in the proportion of 106 to 100. The process of averaging can be elaborated by allowing for the relative importance of the products. If one is five times as important as another, it can be reckoned as five products and the other as one. There are many refinements in the theory of index numbers (*see* INDEX NUMBER). What we are concerned with here is that there is a sufficiently definite conception of a price level, measured by an index number, and that the wealth value or purchasing power of the monetary unit varies inversely as the price level. The problem we have to solve is this: how is the price level related to the supply of money? Prices are determined in markets. Dealers who find sales of any product to consumers increasing, and their stocks diminishing, raise prices; if they find their sales falling off and their stocks accumulating, they lower prices. In the one case they give more orders to producers, and at higher prices; in the other they give fewer orders to producers, and at lower prices. They are always seeking an equilibrium price at which their stocks are just kept at a convenient level.

Consumers' Income and Consumers' Outlay.—The price level of all products is settled in the same way as the price of any one of them. Demand is composed of all the money that consumers spend. We must include not only what they spend on consumable goods, but what they spend on investment. In ordinary speech this is said not to be spent but to be saved. But in reality it is spent on the products of which fixed capital is composed. The demand for the services of builders arises from the money spent on the acquisition of houses in just the same way as the demand for the services of bootmakers arises from the money spent on the acquisition of boots. People may apply their savings not to acquiring houses but to buying stocks and shares; but shares represent money spent on the capital assets (plant, etc.) of companies. A man may employ his savings to buy shares from another, but the seller of the shares is then left with money to invest or spend. Without multiplying instances, it is clear enough that money invested is spent. A man devotes his income partly to buying consumable goods and partly, in the form of savings, to buying capital goods or pecuniary rights in capital goods. The total demand for all products is the total of what all people in the community spend from their incomes. The total of incomes may conveniently be called the "consumers' income," and the total spent the "consumers' outlay." These are totals of monetary units.

The price level is determined by the amount of the consumers' outlay; it tends to be such that the consumers' outlay just buys the community's output of wealth, commodities and services, consumable goods and capital goods. If the price level is too high, sales fall short of output, and stocks accumulate. If the price level is too low, sales overtake output, and stocks are reduced. In the one case dealers tend to put prices up, and in the other to put prices down, till equilibrium is reached. Thus, with a given output of wealth, prices are proportional to the consumers' outlay. Any departure from this principle implies an increase or decrease in the stocks of commodities.

The Unspent Margin.—Everyone who receives and pays money, whether it be his own income or the turnover of his business, will in general at any time have a balance in hand unspent, representing the margin of his receipts over his payments up to date. In a country where a banking system exists, this balance need not be money. It may be partly and even mainly composed of bank credit. A debt can be paid not only with money, but by being set off against another debt, and a bank provides facilities for this procedure. A debt due from a banker (bank credit or "credit money") can be assigned from one creditor to another by means of a bank note or cheque. Bank credit tends to be used for all the major payments. A man with a banking account on which he can draw will keep the greater part of his balance in the form of bank credit; the money he holds will be no more than pocket money. On the other hand those who are not rich enough to have banking accounts (numerically the great majority) must keep their balances in money. Anyone's balance, whether it be all money or partly bank credit, will be constantly varying. From time to time, when it grows beyond what the possessor thinks it reasonable to hold as idle money, he will invest a portion (spend it on capital). Through all these variations the balance will tend to a more or less definite norm or average, depending upon his income and circumstances.

If we add up all the balances held in the community, we get a total composed of (1) all the bank credit, and (2) all the money in the hands of the public outside the banks. This total we will call the "unspent margin." The unspent margin excludes the money in the hands of the banks, because this is merely a part of the assets held by the banks against their liabilities to depositors, and these liabilities have already been counted under the heading of bank credit. If money is paid into or drawn out of the banks, the unspent margin remains unchanged; all that happens is that money is transformed into bank credit, or bank credit into money. But if a change in the volume of bank credit is brought about by a change in the total amount of the banks' assets other than money (their "earning assets," such as loans, discounts, investments, etc.), then an equal change is effected in the unspent margin.

The unspent margin may be divided into two parts, consumers' balances and traders' balances. A trader is at the same time a consumer, and his private balance and business balance may not be kept separate, but the existence of such cases does not invalidate the broad division. The consumers' outlay must be equal to the consumers' income, *except* in so far as the consumers' balances change. If the balances increase or diminish over any interval of time, then the consumers' outlay over that interval is less or greater than the consumers' income by the precise amount by which the balances change.

Traders' Stocks.—The consumers' outlay is what is paid to the traders and others who take part in all the processes of production, transport and dealing, by which goods and services of every kind are placed at the consumers' disposal. But the consumers' income itself is simply composed of the remuneration derived, in the form of profits, wages, salaries, rent, interest, from these very processes. (Incomes which are not so derived are directly or indirectly charged upon incomes which are.) If the consumers' income is not exactly equal to the receipts in terms of money derived from the economic activities of the community, that is because there intervenes a class of traders who hold varying amounts of goods in stock, and whose profits are not identical with their net cash receipts, but can only be calculated from a balance sheet. Traders are those who either produce or buy goods with a view to sale. If a trader's sales of goods from stock outstrip his purchases or output, his net cash receipts are in excess of his income. If the sales by all the traders as a group outstrip their output, then their net cash receipts are in excess of their income, and the consumers' income falls short of the consumers' outlay by the difference.

It should be pointed out that traders are constantly buying from one another. Retailers buy from wholesale dealers, and wholesale dealers from producers. Producers buy their materials from wholesale dealers, and dealers buy from one another. But all these transactions are in anticipation of the ultimate sale to the consumer (or to the investor), and their effect is to distribute the price received from the consumer among all the different traders, and the other people engaged in economic activity. To these latter the money payments, in the form of wages, salaries, interest and rent, are pure income. When a trader sells, money is substituted for goods in his working capital; when he spends money on buying or producing, goods are substituted for money. If there were no such thing as credit, a trader's transactions would involve very large fluctuations in the amount of money held by him. In that case, when consumers spend more than they receive and their balances are diminished, the traders' balances would be increased by an equal amount.

Temporary Borrowing.—The use of banking, however, makes the course of events quite different. The holding of a balance of idle money is a source of loss. Instead of keeping a large balance of money in hand to meet any big expenditure that the course of business may make desirable, traders rely on borrowing temporarily from their bankers. They pay interest so long as they need the loan, and then when they receive money they pay it back. Thus goods may pass from trader to trader, and each will become indebted so long as he holds the goods, and will pay off the debt as soon as he sells them. The result is that when the traders' sales are accelerated, they do not hold the extra proceeds in money; they pay off bank advances. And when their sales fall off or their output outstrips sales, they do not meet the situation by reducing their balances of money; they borrow more from the banks. Traders' balances do of course vary. Apart from casual variations, they tend to rise and fall in proportion to turnover. They are also materially affected as we shall see presently, by the prospects of business and the state of credit. But the primary response of the traders to an increase or decrease in cash receipts in comparison with disbursements is to be found not in their balances but in their indebtedness to the banks.

If we imagine a community without banks (as in the middle ages) and suppose an addition made to the supply of money, the people who in the first instance receive the money will find their cash balances disproportionately increased. They will forthwith increase their expenditure. The money then passes into the hands of the traders who supply them, and they in turn will proceed to spend it (*e.g.*, on replenishing their stock in trade, or extending their fixed capital) and pass it on to others who will be placed in turn in the same position. Demand is increased, production stimulated, and the incomes of people engaged in trading and production swollen. Production cannot be stimulated beyond capacity, and as that limit is approached the increased demand takes effect in a rise of prices instead of additional output. Increased output and increased prices alike mean increased consumers' income and consumers' outlay. And as people's incomes increase, they hold increased cash balances. A new state of equilibrium is reached when the requirements of the community in regard to balances have so far increased as to absorb all the additional money.

Expansion of Credit.—In a community with a highly developed banking system what requires to be considered is, not so much an addition to the supply of money, as an addition to the supply of bank credit. In fact an addition to the supply of money, raising people's balances of money above requirements, would probably be immediately paid into the banks and so transformed into bank credit. The unspent margin is composed of bank credit, plus the money outside the banks. Apart from changes in the supply of money, it can be increased or decreased by an increase or decrease in the earning assets of the banks. Suppose, now, that the banks proceed to lend more, that there is what is called an expansion of credit. The borrowers are probably traders. They do not borrow money to hold it idle, but disburse it forthwith on the purchase of goods. The goods purchased have to be supplied or replaced by producers, whose incomes from profits and wages are thereby increased. The money lent by the banks quickly reappears in the form of an addition to the consumers' income. It is almost true to say that, if the banks begin to lend £10,000 a day more than before, the consumers' income is increased by £10,000 a day, though of course no such numerical statement could be exact.

Close on the increase in the consumers' income follows an increase in the consumers' outlay, but not in general an exactly equal increase, for the recipients of the increased incomes will probably retain a little in balances. The increased consumers' outlay is felt by the dealers in commodities as increased demand. They sell more and will apply superfluous receipts to repaying bank advances, but may retain a little in balances in virtue of their increased business. The dealers in commodities, finding themselves with increased sales, reduced stocks and less indebtedness, will be led to give further orders to the producers. The activity of the producers is intensified, they borrow more, the consumers' income is still further swollen, and demand is again increased. Whereas in the first instance the lending by the banks and the consumers' income are made greater by approximately equal amounts, the increase in lending is soon offset by an increase in repayments. The actual increase in the outstanding amount of bank loans (and therefore in the amount of the unspent margin) is limited to the excess of lending over repayments. This excess is equal to the increase in consumers' balances, plus the increase in traders' balances (in fact that is another way of saying that it is equal to the increase in the unspent margin).

As productive activity approaches capacity, prices rise. In fact, unless productive resources are seriously under-employed at the outset, the expansion of credit will very quickly cause a rise of prices. The rise of prices will tend to be such that the consumers' outlay will just buy total output; consumption and production will then keep pace. Equilibrium will be regained when consumers' balances are in due proportion to the consumers' income and consumers' outlay. Their balances cease to increase, and consumers' income and consumers' outlay are equal. The increased lending by the banks is then completely balanced by increased repayments.

A similar analysis applies to a contraction of credit, the case of diminished lending by the banks. Productive activity declines, and the consumers' income decreases. The consumers' outlay also diminishes but to a less extent, because balances are drawn on. Sales fall off, and traders repay bank advances more slowly. With diminished sales and producers under-employed, prices fall. Equilibrium is reached when consumers' balances have been reduced in due proportion to the consumers' income and the consumers' outlay. But in the case of a credit contraction a further period of adjustment may still be required, to bring productive power into full employment again.

Quantity Theory.—In all these cases, if, after the transition is completed, the economic activities of the community revert to what they were before it began, the mutual proportions among in-

comes, balances, prices and other quantities expressed in monetary units will be substantially unchanged. All will have risen or fallen, as the case may be, in proportion to the unspent margin. In practice this does not occur, for economic conditions are constantly changing, and the process of transition itself would probably modify them. Nevertheless the principle that the price level will be proportional to the unspent margin, hypothetical though it be, is one of profound significance. Money is not wealth. It is composed of symbols or tokens, which are valued not in themselves but for what they will buy. All sums of money, incomes, balances, debts, may be regarded as entitling their possessors to so much wealth. The amount of wealth represented by any sum of money is proportional to the number of monetary units it contains and inversely proportional to the price level. A man's balances of money and credit money are determined with a view to his probable receipts and payments. Balances, receipts and payments may be regarded each as the equivalent of a certain amount of wealth. Essentially the process by which the balances are adapted to the receipts and payments takes account of their mutual proportions, and not of the absolute number of monetary units in each. That is to say, had the number of monetary units in each been different, but the amount of wealth represented by each the same, no material difference would have been made in the economic structure of the community. The numbers of money units representing balances, receipts, payments, prices, debts are of the form only; their mutual proportions are of the substance. This is the principle underlying what is called the quantity theory of money, which states that, other things being the same, the price level is proportional to the unspent margin.

The unspent margin is composed of money and bank credit. If among all the things assumed to be the same we include the proportion of bank credit to money, the quantity theory may be enunciated in another form, that the price level is proportional to the quantity of money in the community. This is the older form of the theory, but it has the disadvantage of making one further assumption. The quantity theory is abstract and almost sterile so long as it makes the assumption that "other things are the same." Our earlier analysis enables us to see what the effect of other things varying will be. The price level is proportional to the consumers' outlay, and inversely proportional to the output of wealth (subject to temporary discrepancies due to changes in stocks of commodities). The authorities, whether governments or banks, responsible for monetary and credit policy, have no means of promptly regulating or certainly measuring the consumers' income, the consumers' outlay or the output of wealth; the factor which is ascertainable, and which they keep under observation is the unspent margin. This circumstance gives a special practical importance to the unspent margin and therefore to the quantity theory.

The consumers' outlay and the unspent margin are related together by what may be called the velocity of circulation. If people hold smaller balances in hand in proportion to their receipts and payments, they may be said to "spend money faster." Velocity of circulation is used in more than one sense in monetary theory. It is sometimes (indeed usually) taken to mean the number of times every unit of money or credit money is transferred from one owner to another in a unit of time. But for the purposes of the quantity theory it is more convenient to define velocity as the ratio of the consumers' outlay to the unspent margin. (This is called "circuit velocity" by Messrs. Foster and Catchings.) Velocity is no more ascertainable than consumers' outlay. Changes in velocity have to be inferred from changes in the unspent margin and in the price level. The price level itself has to be measured by index numbers which can never be anything but approximate.

Velocity however is affected by certain known causes, particularly by people's expectations in regard to markets. When demand is active and prices are rising, traders become more unwilling than usual to keep money idle, for the consequent loss of profit is greater; they pay away money for goods as fast as they can. When demand is sluggish and prices are falling, traders become unwilling to add to their stocks of goods. The loss on idle money is diminished, and in extreme cases vanishes altogether; for investment in goods may, owing to a fall of prices, bring an actual loss instead of a profit. With a given unspent margin the consumers' outlay is greater when credit is expanding and prices rising, smaller when credit is contracting and prices falling. Therefore when expanding credit increases the unspent margin, the price level rises more than in proportion, and when contracting credit decreases the unspent margin, the price level falls more than in proportion. On the other hand these exaggerated movements in the price level may be temporarily masked by changes in stocks of commodities. The quantity theory is often misinterpreted to mean merely that when the unspent margin increases prices rise, and whenever it decreases prices fall. But it is more precise than that, for it says that, other things being the same, whenever the unspent margin increases or decreases prices rise or fall exactly in proportion. In the nature of things such a principle can never be proved by practical examples, because the condition that other things remain the same can never be fulfilled. The quantity theory can never be anything but theory; along with the requisite analysis of the "other things," it supplies a clue to the interpretation of the facts.

Relation of the Monetary Unit to the Standard.—We have now shown how the price level or its reciprocal, the wealth value of the monetary unit, is determined. In the earlier sections we have shown how the value of the unit can be fixed in terms of gold or silver. Here are two processes for determining the value of the monetary unit; how are they to be reconciled? Payment by weight automatically equates the monetary unit to a specified amount of the standard metal. The quantity of metal in use as money is bound so to adjust itself that the market value in monetary units of the metal as an industrial material is equal to its value as money. For if its price as a material is too low, some will be diverted from money to industry; if too high, some will be diverted from industry to money. Where coin is used and payment by tale prevails, the adjustment is not so certain. To divert metal from industrial to monetary use, the market price must fall to the coinage price. To divert it from monetary to industrial use, the market price must rise to the melting point of the coin, that is to say, to the point at which the metal in a coin is worth more than the value for which the coin passes current. There may be a gap between coinage price and melting point, not only on account of seigniorage, but possibly on account of imperfection in the coin.

Suppose that for any reason the value of the monetary unit falls, or in other words the price level rises. The rise in prices would be general. Under the conditions of practical life it would not be in identically the same proportion for all products, but any product would, in the absence of any disturbing cause, be affected to approximately the same extent as the average of the others. The market price of the standard metal would rise. If the coins in circulation are imperfect, there is no one melting point applicable to all. The value as bullion of the least imperfect coins would be highest, and would overtake their nominal value first. Thus the best coins would be melted or sold as metal first, and only the more imperfect would be left. Before the modern improvements in the technique of coining, the deterioration of the coinage through the disappearance of all the best coins was a frequently recurrent experience in all countries. An issue of debased or light coin (containing less than the prescribed amount of the standard metal) if added to the existing stock of money, has the effect of depreciating the unit. The good coins of full weight then reach melting point, and their disappearance keeps down the stock of money, and, so long as any of them remain, the depreciation is kept within limits. The debased coin simply displaces the good coin.

This is the principle known as "Gresham's Law." Bad money drives out good. H. D. Macleod rather hastily attributed it to Sir Thomas Gresham on the strength of a letter written to Queen Elizabeth, but he afterwards found that the law had been known long before (*e.g.*, to Oresme and Copernicus). Gresham's law only operates where coins are paid by tale at their nominal value. If the better coins pass in payment at the value of the metal they actually contain, there is no profit in melting them. But it is so

inconvenient to have to allow a variable premium on coins that this does not usually occur.

If the coinage is perfect, all the coins reach melting point at the same time. It must not be inferred that the entire stock of money will be disposed of as metal in a day. As soon as coins begin to be melted, the stock of money is thereby diminished, and the tendency to depreciation is counteracted. Only so much coin is melted as will bring this result about. Paper money convertible into good coin behaves in the same way as good coin itself. If the issue is increased, and the unit tends to depreciate, notes are converted into metal, and so withdrawn from circulation. Without invoking the quantity theory, it is easy to see that an increase in the supply of money must, if it goes far enough, depress the value of the unit, and a decrease raise it. So long as money is composed of a marketable material or is convertible into such a material, the adjustment which raises or lowers the value of the unit so as to be constant in terms of the material is automatic.

The value of the monetary unit in terms of the standard metal is constant, but that does not mean that its value in terms of wealth in general is necessarily constant. Like any commodity the standard metal may be exposed to variations of price not in accordance with the general trend of the price level. But it is also exposed to special influences on account of the very fact that it is used as money. Every country that uses gold or silver as its monetary standard provides a market for the metal at the coinage price, and holds a stock in the form either of coin in circulation or of reserves against paper currency. There is an industrial demand for the precious metals for the production of plate, jewellery, etc., and for various purposes such as the use of gold in dentistry or in the manufacture of fountain pens. But this industrial demand is not easily expanded and is incapable of absorbing any considerable amount of surplus metal. When gold or silver is displaced from the monetary stock of any country, and has to be disposed of, the only adequate opening is in other countries which have the same metal for their monetary standard. If the metal is sold abroad, the proceeds will be held in the form of foreign money or credit money. The out-turn of the transaction will depend on the terms on which this foreign money can be disposed of.

The Foreign Exchange Market.—It is the business of the foreign exchange market to buy and sell foreign money. The things dealt in are pecuniary rights, embodied in bills of exchange, cheques, telegraphic transfers and similar instruments, entitling the possessors to specified sums in foreign countries. For each foreign monetary unit so offered, a price is quoted in terms of the money of the country where the market is being carried on. In order to make clear the working of the foreign exchange market, the best course will be first to consider the general case where currencies may be free to vary independently of one another, and then to pass to the particular case of countries linked by a common metallic standard. The things produced or consumed in any country may be divided broadly into two classes, those which are, and those which are not, suitable for exportation and importation. The former, comprising goods actually exported and imported and goods in competition with exports or imports, may be called foreign trade products. The latter, the goods and services unsuitable for export or import, may be called home trade products. The boundary between the two is not a precise one, but the characteristic of the foreign trade products is that their prices are regulated by international markets, whereas the prices of home trade products depend on local markets only. A foreign trade product has a different price in terms of the currency of every country in which it is dealt in. But these prices are in competition with one another. In virtue of the rates quoted in the foreign exchange market, every currency can be expressed in terms of every other, and the prices of a foreign trade product in any two countries, when so expressed, cannot differ by more than the cost of transporting the product from one to the other (so long as markets are functioning effectively).

If we suppose the consumers' outlay in any country to increase, without any corresponding increase in production, the result will be the increase of consumption. There will be increased demand both for home trade products and for foreign trade products. For the former the increased demand will soon be reflected in a rise of prices. But the prices of foreign trade products are tied down by international markets, and cannot rise appreciably, so long as foreign exchange rates remain unchanged. In the first instance therefore the increased demand will take the form of an increase in the quantity consumed. There will arise an excess of imports; the country will be consuming more than its production will pay for in international markets. The foreign exchange market has to provide for payment for this import excess; dealers will receive more than usual of the country's currency and will part with more than usual of foreign currencies. In order to preserve a balance between their holdings of different currencies, they will offer less of the currencies of which they are short for that of which they hold too much; the country's currency will become cheaper in terms of foreign currencies. When that happens, the foreign exchanges are said to become "unfavourable"; when the value of the country's currency in terms of foreign currencies rises, the exchanges are said to become "favourable." An expansion of the consumers' outlay without any increase in production tends to bring about an excess of imports and an unfavourable exchange; a contraction of the consumers' outlay without any decrease in production tends to bring about an excess of exports and a favourable exchange. The prices of foreign trade products, being approximately fixed in terms of foreign currencies, are raised by an unfavourable exchange, and lowered by a favourable exchange. If the movements in the foreign exchange market are perfectly free, the adjustment of the prices of foreign trade products will correct the excess of imports or exports as the case may be. An unfavourable exchange will check the consumption of foreign trade products, and a favourable exchange will stimulate it. Equilibrium will thus be re-established. An expansion of the consumers' outlay will in any case have raised the price level of home trade products, or a contraction will have lowered it. Thus, provided the foreign exchange rates are free to move, there is in the one case an all round rise of prices, in the other an all round fall.

But if the country shares with its neighbours a common metallic standard, this is not so. If the currency of any country is convertible into gold, and the gold is convertible into the currency of any other, all the currencies are convertible into one another at no greater cost than is involved in sending gold from country to country. Now gold is a foreign trade product, and one very easily transportable. In time of peace the cost of sending it (in considerable quantities at a time), even to the greatest distances, never much exceeds 1% of its value (including insurance and loss of interest). Between London and New York it is about $\frac{5}{8}$%. If the consumers' outlay expands, the prices of foreign currencies cannot rise beyond the point at which they can be acquired by sending gold (called the "export gold point" or "export specie point"). The price level of foreign trade products is prevented from rising beyond the corresponding level. The excess consumption of foreign trade products is therefore not checked, and equilibrium is not regained. The exchanges remain at the export gold point, and gold continues to be exported. The gold in fact pays for the excess of imports. The only way in which the outflow of gold can be stopped is by correcting the undue expansion of the consumers' outlay by which the excess imports are attracted. In a country with no more than a primitive credit system and no paper money, where the greater part of the unspent margin is in the form of coin, gold movements will themselves affect the unspent margin, and consequential changes in the consumers' outlay will follow. The path to equilibrium may be complicated by changes in the circuit velocity of money, but sooner or later the gold movements must be decisive.

A highly developed banking system modifies this process. In the first instance an inflow or outflow of gold takes effect in an increase or decrease in the gold holdings of the banks. If the banks are content to see their reserves modified without altering the total amount of bank money, the effect of the gold movements on the consumers' outlay is suspended. In general, however, banks aim at keeping a nearly constant proportion between their deposit liabilities and their reserves. With that object in view they

expand credit when they receive gold, and contract credit when they lose gold, and these credit movements bring about an increase or a decrease, as the case may be, in the consumers' outlay. The influx or efflux of gold then has much the same effects as if there were no banks, but this depends upon the banks taking the appropriate action.

Central Banks.—Under modern conditions a highly organized system of banking has been evolved. The tendency is to concentrate the responsibility for the regulation of credit and money in a central bank. The central bank is the channel through which paper money is issued, and is responsible for maintaining adequate gold reserves to ensure the convertibility of the paper money. It is also the basis of the bankers' clearing system; that is to say, the other banks (the "competitive banks") pay their liabilities to one another by cheques on the central bank. And when the competitive banks run short of money, the central bank supplies their requirements by lending (by way of rediscounts or advances). The paper money often takes the form of the central bank's own notes, with the privilege of being legal tender. In practice it is not even necessary that they should be legal tender. In the United States the Federal Reserve notes are not legal tender, but are regarded by the public as absolutely on the same footing as money. In some countries the central bank is given a monopoly of the issue of notes, and in some others, where it has no monopoly, the rights of issue of other banks are no more than a survival and are restricted. In these ways the whole responsibility for the paper currency has come into the hands of the central bank. And where gold coin circulates (as in England, Germany and France before 1914) it is on the central bank that the competitive banks and therefore the whole community rely for supplies of coin. People do not take gold to the Mint to be coined, they sell the gold to the central bank for credit, and if they need gold coin they draw upon the credit for it. The price of gold in the market is regulated not directly by the coinage price but by the central bank's buying price. The buying price is fixed close enough to the coinage price to ensure that this practice shall prevail. For example in England the Bank of England is required by the Bank Charter Act of 1844 to buy gold at £3.17s.9d. per standard ounce (11/12 fine), while the coinage price is £3.17s.10½d. The difference—(1·6 *per mille*) is no more (and usually less) than equivalent to the loss of interest incurred in the interval between delivery of gold to the Mint and the completion of the process of coinage.

If the central bank issues notes which are legal tender, and so can pay its liabilities with paper, some special provision is needed to make the notes convertible into gold. For example the notes may not be legal tender in payments by the central bank itself, so that the bank must pay in coin if so required. Or an express obligation may be imposed on the central bank to convert the notes into coin. Or, yet another alternative, the central bank may simply be required to sell gold bullion at a fixed price.

This last method was first suggested by Ricardo, and embodied in the Act of 1819 for the resumption of cash payments by the Bank of England. At that time it never became operative. But the plan was revived in the Gold Standard Act, 1925, and has now become recognised under the name of the Gold Bullion Standard.

Whatever the precise arrangement may be, the general effect is that the central bank is the source of supply of money for the community, and at the same time undertakes to convert gold into money and money into gold. The creation of credit by the competitive banks depends upon their supply of money, and the central bank is therefore in a position to dictate credit policy. Its note issue is backed partly by gold and partly by bills, advances and other securities. It can at any time increase or decrease the note issue by increasing or decreasing its holding of these securities. The competitive banks, when they run short of money, borrow from the central bank, thereby increasing its holding of securities and its note issue; and the terms on which the competitive banks lend to traders throughout the community tend to conform (or can be made to conform) to the terms on which the central bank lends to them. The extent to which an inflow or outflow of gold affects the credit position, and through it the consumers' outlay and the price level, depends upon the response of the central bank. If the central bank so reduces or increases its lending that the change in the amount of gold held is offset by an equal and opposite change in its securities, its total assets and its note issue remain unchanged, and the effect of the gold movement is counteracted. If the relation of the note issue to the gold reserve is prescribed by law, and the central bank treats the relation so prescribed as the guiding principle of its credit policy, then the inflow or outflow of gold will regularly take effect in an expansion or contraction of credit. Where a number of countries have a common metallic standard, the effect is that the currency of each is regulated by reference to the foreign exchanges. As soon as the rate of exchange between any two of them is allowed to vary so far as to reach one of the gold points, gold begins to flow. To observe a gold standard means in effect to keep the foreign exchange rates fixed.

Bimetallism.—Under modern conditions gold is the accepted standard; silver persists only in China, Persia and Abyssinia. In the middle ages silver was the principal standard, but gold was widely used as a merchants' medium. Sometimes two separate moneys of account co-existed, one tied to gold and the other to silver. Sometimes there were even more than two, their market values in terms of one another, of gold and silver, and of various coins being governed by very complex and obscure causes. This state of confusion even now appears in parts of the East. But in Europe economic development gradually brought monetary order. Gold and silver had their respective coinage prices and melting points in terms of one accepted money of account. But infinite trouble was caused because the prices so fixed in different countries were not consistent with one another or with the market values of gold and silver. Each metal flowed out of the countries where it was valued lowest and into those where it was valued highest. The process was really an application of Gresham's law. The mediaeval confusion was one of the consequences of imperfect coinage. By the end of the 18th century matters had improved, and the market value of gold in terms of silver had become a comparatively stable and ascertainable ratio. Now, in the market for the precious metals the demand for use as money has always overshadowed the industrial demand. If all countries, or even if several of the wealthiest countries established bimetallism, *i.e.* the free coinage of both gold and silver, and based their coinage systems on the same ratio of gold to silver, that ratio would govern the market prices of the precious metals all over the world. This actually occurred in the 19th century. *See* BIMETALLISM.

Nowadays a metallic standard has come practically to mean a gold standard. To any one country a gold standard means stable rates of exchange in the others. Three different methods of securing this end may be distinguished. That based on the free coinage of gold may be called a gold specie standard. That based on the convertibility of paper money into bullion is called a gold bullion standard. The third is what is known as a gold exchange standard.

Gold Exchange Standard.—The principle of the gold exchange standard is convertibility of the currency not into gold but into foreign currencies. The central bank or currency authority holds a reserve in the form of bills of exchange or other pecuniary rights in foreign centres, and instead of offering to buy and sell gold at fixed prices, offers to buy and sell foreign currencies. The currency of the country (which may be either paper money or token coins), instead of being convertible into gold, is convertible into foreign currencies which are equivalent to gold. The gold exchange standard presupposes the existence somewhere of a gold bullion standard or a gold specie standard. It can be combined with these other standards in the same country. A central bank may undertake to sell gold at the coinage price, and may yet in practice forestall demands for gold by selling foreign exchange. In general people demand gold for the purpose of acquiring foreign exchange by selling the gold abroad, and if they are offered the foreign money they need they do not ask for the gold. A country which adopts the gold exchange standard gains the advantage of holding interest-bearing assets in place of idle gold. And from the standpoint of the world in general the system has the advantage of

economising gold. It pushes one step further the advantage which the use of paper money brings in this respect, without the dangers of inconvertible paper money.

But the economy of gold itself has dangers. Since the demand for gold for monetary purposes dominates the bullion market, a general diminution of that demand would result in a fall in the wealth value of gold, in other words a rise in the price level in terms of all gold currencies. The probable extent of such a fall in wealth value is illustrated firstly by the fall in the value of silver relative to gold after the abandonment nearly everywhere of the free coinage of silver, and secondly by the rise in the price level which accompanied the extensive displacement of gold by paper money during and after the World War. In the former case the price of silver in London fell from 60d. a standard ounce in 1872 to 22d. in 1903 (*i.e.*, the ratio rose, from 15½ to 1, to 43 to 1). In the latter the price level in the United States (which retained the gold standard) rose from 100 in 1913 to 247 in May 1920.

The problem of future currency policy was considered at the Genoa conference in 1922, at which all Europe was represented, together with Japan and the British Empire. The price level had fallen far from its highest point, but was still substantially above the pre-war average. Recommendations were adopted in favour of a development of the gold exchange standard in order to guard against too great a competition for gold, but at the same time it was proposed that the central banks of the world should co-operate and regulate credit with a view to preventing undue fluctuations in the purchasing power of gold. That meant that the economy of gold arising from the use of the gold exchange standard, while being used to guard against an undesirable appreciation of gold or fall of prices, should not be pushed so far as to cause an undesirable depreciation of gold, or rise of prices.

Price Stabilization.—The general use of paper money has placed the entire monetary stock of gold in the hands of the central banks in the form of gold reserves. It is they who control the market for gold. They stand ready to buy and sell gold in unlimited quantities at fixed prices, that is to say, in each country, at prices fixed in its own monetary unit. In order to prevent fluctuations in the wealth value or purchasing power of gold, they must prevent fluctuations in the wealth value of the monetary units. By credit regulation a central bank can expand or contract the consumers' income and the consumers' outlay, and so can elevate or depress the price level. But in order to carry out an internationally concerted policy of price stabilization, the central banks as a group must be prepared to regulate credit independently of their gold reserves. The price level being held stable, they must be prepared to buy or sell gold, and to see their gold reserves increase or decrease, without modifying their credit policy. To expand or to contract credit would be to raise or lower the price level. This policy of price stabilization by international action, though it has gained very general recognition, is still in an experimental stage. The price level is exposed to many non-monetary influences affecting particular products or groups of products, such as variations in crops, discovery or exhaustion of mines, changes in manufacturing processes. The policy of stabilizing the wealth value of gold requires not that an index number of prices should be kept rigidly fixed, but that those variations which might arise from purely monetary causes should be prevented.

The course of foreign trade and the balance of payments introduce a further complication. A change in the balance of payments modifies the relations between the internal and external price levels. If a country suffers from a shortage of production of foreign trade products, or if it has to make an exceptional external payment, its imports must be curtailed relatively to its exports in order to adjust its visible trade to its new balance of payments. If it is to retain the gold standard, there must be a contraction of credit to bring about a shrinkage of the consumers' outlay. In the same way a country which experiences increased productivity or receives an exceptional payment from abroad maintains equilibrium by expanding credit and bringing about an increase in the consumers' outlay. In the one case the price level of home trade products rises in comparison with that of foreign trade products, in the other it falls. If world prices remain stable, internal prices must rise or fall, and to that extent the price level in the country affected will not be perfectly stabilized.

The preceding sections have been written on the assumption that paper money is convertible into gold. The Genoa plan is based on the continued general use of the gold standard. Proposals have been put forward (particularly by Mr. J. M. Keynes) for applying the policy of stabilization of purchasing power to a paper currency entirely dissociated from gold. The practicability of such a plan is a matter of controversy, and the general return to the gold standard throughout the greater part of the world has made the question an academic one. Apart from schemes of the type favoured by Mr. Keynes, paper money dissociated from gold is a monetary disease. The abuse of paper money became so prevalent during and after the World War, that it has been given an almost disproportionately important place in latter-day monetary theory.

War Finance and Inflation.—The overwhelming exigencies of war drive a country to supplement its tax revenues by borrowing money on a great scale. The amount that can be borrowed from investors is limited to what they can be induced to save. It may not be enough. The Government can neither relax its efforts nor leave its liabilities unpaid. It has recourse to temporary borrowing. Banks lend by creating credit; they create the means of payment out of nothing. Inflation occurs. The consumers' income and the consumers' outlay are swollen, consumption is stimulated, stocks of goods are drawn on, prices rise and the foreign exchanges become unfavourable. There results an outflow of gold. The accepted method of stopping an outflow of gold, a contraction of credit, is not available, and it becomes impossible to continue to provide gold for export. Either the convertibility of paper money into gold is suspended or the export of gold is prohibited; in either case the gold standard ceases to operate. Inflation increases the unspent margin. In a country where bank credit is the principal medium of payment, the money portion of the unspent margin increases after an interval; the requisite increase of the note issue is a condition of the credit expansion, for the banks cannot lend to the Government unless they are assured of whatever supplies of legal tender money may be demanded by their depositors. In a country where bank credit is little developed and paper money is the principal medium, the Government will probably be driven at an early stage to borrow direct from the central bank and to take out the proceeds in paper money. The Government may even shorten the process by printing paper money for itself and paying its creditors with it.

As soon as inflationary finance has led to the abandonment of the gold standard the monetary unit begins to depreciate. The depreciation is likely soon to be accelerated by speculation. People are unwilling to hold balances in a discredited unit. They pay away their money as fast as they can in exchange for "real values," for things, that is, of which the value does not depend upon the monetary unit. They buy commodities, or ordinary shares, or foreign currencies—anything which can rise in price as the value of money falls. When people pay away balances, they can only pay them to one another. The aggregate of balances cannot decrease. The unspent margin has been swollen by bank advances to the Government and cannot be decreased except by repayments. When people accelerate their payments the effect is to increase the consumers' outlay out of proportion to the unspent margin. And along with the consumers' outlay the consumers' income increases. The velocity of circulation is increased. The result is that the price level is raised *more* than in proportion to the unspent margin. A rapid rise of prices disorganizes markets. The prices of different products rise very unequally. People buy things for a temporary investment rather than for consumption. For such an object foreign currencies are a more convenient acquisition than any commodity, and it sometimes happens that there is a rush to the foreign exchange market which raises the rates of exchange, and therefore the prices of foreign trade products, out of all proportion to the prices of home trade products. The same discredit of the currency which leads people to pay away balances of cash, impels them to borrow from the banks. It is highly profitable to borrow for a short period and to use the proceeds to buy
